A 6-element array for 222 Mc. has driven elements 20 inches long, with directors  $25\frac{1}{2}$  inches long of  $\frac{1}{4}$ -inch thin-walled brass tubing. End insulators of  $\frac{1}{4}$ -inch o.d. fiber bakelite mount in a  $1\frac{1}{8}$ -inch square wooden boom  $3\frac{1}{2}$  feet long. The directors are 4 inches in front of the driven elements. The phasing line of TV ladder line is 40 inches, with a  $26\frac{1}{2}$ -inch tuning stub at the center. When 300-ohm tubular-type line is employed it is tapped  $2\frac{1}{2}$  inches up from the short. Metal construction would have been satisfactory, but in view of the small size, wood was used.

The simple 6-element array of Fig. 2 offers good possibilities for portable operation. A gain of 10 db. or more over a car antenna of the same height (more if a few feet of mast is added) can mean a tremendous improvement on long-distance contacts. Either the 6- or the 12-element beam is light in weight and of low wind resistance and can be handled readily by one man. The horizontal directivity pattern is the same with both beams (when vertical polarization is used) but the gain of the 12-element array is increased by 3 db. because of the lowered vertical angle of radiation.

### BC-746 Tuning Unit Close-out

Brand new. With 2 FT243 crystals, on 4790kc for xmitting and one 5305kc for receiving; RF and antenna coil; 140 mmf; midjet variable; miniature 3 prong polystyrene coil socket; dual crystal socket; 10 contact terminal strip; resistors, etc. Can be disassembled for parts or converts to low power xmitter or receiver. Built to rigid army specifications. Sturdy fibre case, metal chassis and bakelite bottom plate. 4x2 $\frac{3}{4}$ x1 $\frac{1}{4}$ ".

R1805. NET..... 89c

### BC-459A

#### Command Transmitter

New! Special Price—Stored uncrated—Some slight dents and scratches in metal case. Popular ARC-5 units. Complete 40 meter band unit (with built-in VFO), easily modified, by removing calibrating crystal and tuning eye from circuit, to operate as 120 watt CW transmitter. Frequency range: 7mc to 9.1mc. Built-in variable inductor tuning, random antenna length. Safety locks to secure controls. Black wrinkle finished brushed aluminum chassis. Tube line-up: Two 1625's (12V 807), 1626 in final stage. Requires 12 volt AC plus high voltage supply. Size: 7 $\frac{1}{4}$ x5 $\frac{1}{4}$ x12 $\frac{1}{2}$ ". Wt., 11 lbs.

R1800. NET..... 7.95

BC-457. As above, except frequency range: 4mc to 5.3mc. Converts to 80 meter band by changing condenser; can be used as is for single sideband VFO. Wt., 11 lbs.

R1801. NET..... 7.95

BC-459A. Same as above but brand new, orig. cartons.

## Applying the Principle to Long Yagi Arrays

A conventional 6-element Yagi with one reflector and four directors gave a measured gain of 9 db. over the reference dipole. A special Yagi with two shortened driven elements and four directors (no reflector) gave 10-db. gain at 145 Mc. Apparently, this design can be used on Yagi antennas to give better performance, and preliminary calculations indicate that a single long Yagi can be tuned up to operate over one megacycle of the 2-meter band with a forward gain of 17 db. This would involve a boom length of some 24 feet, however. Experimentally, it may be possible to better this figure for a very narrow bandwidth. This offers interesting possibilities for long-distance 2-meter c.w. communication, say, between 144.0 and 144.2 Mc., with selective receivers and a few hundred watts of transmitter output.

## "Tiny Tim"

(Continued from page 27)

be operated from a car using an 8-foot whip, properly loaded, worked against the car body as ground. I'm even thinking of trying it as aircraft mobile!

With this self-contained ham station you build yourself, you're ready for any emergency with a reliable, low-power c.w. station on 40 and 80 — and you can have plenty of fun with it from your home station, out in a boat, at the beach, climbing a mountain, or whatever.

I wish to acknowledge the helpful suggestions of the late Walter Bradley, W1FWH, of ARRL, and the assistance of my 11-year-old son, WN1BRS, in assembling the rig and manning the home station during tests.

## I.F. Amplifier

(Continued from page 34)

The over-all bandwidth of the amplifier can be calculated from

$$\Delta f \cong k_c f_o \sqrt{2} \sqrt[4]{\left[\frac{1}{m^2}\right]^{\frac{1}{n}} - 1}$$

voltage at  $\frac{\Delta f}{2}$  cycles off resonance

where  $m = \frac{\text{voltage at } \frac{\Delta f}{2} \text{ cycles off resonance}}{\text{voltage at resonance}}$

$n$  = number of identical stages.

For the bandwidth at 3 db. ( $n = 3$ ),

$m = 0.707$ ,

$\Delta f = 112$  cycles.

The response curve of the complete amplifier is given in Fig. 6. The bandwidth is 220 cycles at 20 db. down and 1000 cycles at 100 db. down.

## B.F.O.

In the unit constructed by the author, the b.f.o. inductor,  $L_7$ , has a  $Q$  of about 25. The coil

# 3100 VOLT - 500 MIL PLATE TRANSFORMER

## \$39<sup>95</sup>

Brand new Acme Plate Transformer. Primary tapped for 98-104-110-116 and 123 Volts — 60 Cycle. Secondary 3100-0-3100 Volts A.C. @ 500 Mils.

Insulated for 15,000 Volts with impregnated mica. Balanced secondary windings. 9" long x 8" high x 7 1/2" wide. Shipping weight 60 lbs. Cost the manufacturer for whom they were made over \$70.00 each. Don't miss out on this super value.

### RECTIFIER FILAMENT TRANSFORMER

only  
**\$3<sup>95</sup>**

2.5 Volt C.T. — 10 AMP. Secondary. Primary tapped same as plate transformer. 10,000 Volt insulation. 3 1/2" long x 4 1/2" high x 3" wide.

### FILAMENT TRANSFORMER

only  
**\$4<sup>95</sup>**

10 Volt center tapped — 10 AMP secondary. Primary tapped same as plate transformer. 10,000 Volt insulation. Makes an excellent auto-transformer. 4" long x 5 1/2" high x 3" wide.

.5 MFD-4000 Volt Sprague Vitamin "Q" oval can capacitors. Single insulated terminals. (Can is common.) Use several of these in parallel for a low cost filter capacitor 2" x 1" 4-5 8".

**10 for \$7<sup>50</sup>**  
**\$1<sup>00</sup> each**

The  
BUG

## VIBROPLEX Semi-Automatic Key

The Vibroplex bug does all the arm-tiring work for you — automatically. Relieves nervous and muscular tension so noticeable when sending by hand. Suits any hand. No special skill required. Adjustable to any speed and any degree of key tension. Easy to operate. Beginners use it in a matter of minutes. Built for long life and rough usage. Vibroplex is the only key with **Jewel movement** — insuring better and easier keying. Used and recommended by thousands of hams and commercial operators on land, sea and in the air. Five models, \$12.95 to \$29.95. Left-hand models, one dollar more. Order yours today. At dealers or direct. **FREE** folder.

Headquarters for **NEW** portables, all models and styles of type. Also, **REBUILT** standard and portable typewriters with **ALL CAPITAL** letters and other styles of type. **Quick service.** Get our prices before you buy!

**THE VIBROPLEX CO., INC.**  
833 Broadway New York 3, N. Y.

was wound in the form of 3 pies on a 1-inch-diameter bakelite rod. Commercially-available chokes could be used and turns removed to give the right inductance value. For *Qs* much different than specified, some adjustment of the feed-back condensers *C*<sub>2</sub> and *C*<sub>3</sub> and the anode load resistance will be necessary. The oscillator was built in a 3 × 4 × 5-inch metal utility box with the tube mounted on one side. The cathode choke coil was pi-wound on a small form. This choke coil is, however, readily obtainable from commercial stock. The oscillator tunes from 20.4 to 23 kc. The low-frequency limit is set by the fixed bandset condenser.

### Power Supply

Although an electronically-regulated power supply was used, it is not absolutely necessary. It does, however, provide a power source having a low output impedance at 20 kc., and thus lends to the over-all stability of the amplifier. The voltages are made available for use with external audio filters and clippers through an octal plug. It is convenient to be able to draw current from the power supply without upsetting the amplifier supply voltages.

### 5-Band Antenna Coupler

(Continued from page 40)

the feedline plus antenna, not feedline plus half the antenna.

In many instances it is more convenient to put up a Zepp antenna than a center-fed one. If, however, there is only room for a 66-foot antenna (half wavelength at 7 Mc.) and 80-meter operation is desired, the feeders can be tied together in the shack and connected to one of the antenna terminals of the coupler. If it will work with a parallel connection, fine; if it won't, a series connection can be tried, with the other antenna terminal of the coupler connected to ground. An antenna worked this way is a "random" length of wire, and consequently, the same tuning procedure applies to a piece of wire that is actually a random length and doesn't have any feedline. The trouble with antennas lacking a true feedline is that they are sometimes responsible for "r.f. around the shack," as evidenced by r.f. on microphones and cabinets.

### Harmonics

One last bit of information worth passing along to the newcomer who may not know one of the values of using a coupler: As many amateurs have found to their sorrow, harmonics of their transmitted signal can get them into trouble with the FCC. The use of a link-coupled antenna coupler provides considerable attenuation of harmonics, usually enough to keep them from interfering with other services. And if one is experiencing TVI caused by harmonics, the coax link line between the transmitter and the coupler furnishes an ideal spot for the installation of a low-pass filter.

# 1955 EDITION

*Big...*

*Revised...*

*Complete...*

## HIGHLIGHTS OF THE 1955 HANDBOOK:

The high-frequency chapter includes many new units incorporating such features as continuous (multiband) tuning units, pi-section tanks and clamp-tube protective circuits. V.h.f. material has been extensively changed to improve clarity and take advantage of techniques developed as a result of greater occupancy of this portion of the radio spectrum. The v.h.f. transmitter chapter includes equipment using tubes developed in the past year. The section on vacuum tubes and semiconductors has been enlarged to accommodate numerous new tubes, crystal diodes and transistors; a complete listing of electrostatic cathode-ray tubes forms a part of the tube tables. The 1955 edition is packed with information useful to the amateur and professional alike!

## LETTINE RADIO MFG. CO.

62 Berkeley St.

Valley Stream, N. Y.

## How's DX?

(Continued from page 69)

doubtful can things get!). ZC4FB further understands that there now are no private amateur stations permitted in Bulgaria; only club combos. Personal call signs are assigned but LZ1RF, the last private LZ installation operative, long has been QRT. . . . . K6EUV never quite made it to Gibraltar as ZB2N but John gave it a good try in late December and early January. Bogged-down transportation undid his plans after all other red tape laboriously had been severed. K6EUV, who had similar difficulties trying to get to St. Pierre a few years ago, advises all would-be DXpeditioners: "Make all possible investigation of transportation facilities. Also make allowance for 220-volt 50-cycle lines which are quite common outside North America. Take along many duplicate copies of your gear list to save time in placating hordes of customs officials. Have an ample supply of spare components, especially tubes, which you probably will find almost impossible to obtain in any rare-DX area." . . . . . W2JIL passes along WASP (Worked All Sicilian Provinces) details. Confirmations from five of these IT1 provinces are required: Agrigento, Caltanissetta, Catania, Enna, Messina, Palermo, Ragusa, Siracusa and Trapani. QSOs must be dated after July 1, 1952, and must be either all c.w. or all 'phone. The five pasteboards plus four IRCs should go to IT1TAI at Box 300, Palermo. . . . . DL4OR hit a brick wall in efforts to carry out his HV1OR intentions but still hasn't given up the idea.

South America — OA5G (ex-KR6LE-9BPR-W9FCJ, W6ZLH) is really roughing it in San Juan, 250 miles southeast of Lima. The nearest telephone is 50 miles away (and no prospects of TVI, either!) . . . . . W8GZ coordinated the efforts of many charitable U. S. amateurs who contributed toward outfitting FY7YE with an effective DX-band installation. Mario now pours out potent r.f. with his new TBS-50D and associated equipment. . . . . W4UEL paid a personal visit to widely-worked YV5FL where s.s.b. is the rage. . . . . VP8 notes via U.K.-bound ex-VP8AZ: VP8AQ QSY'd from So. Orkneys to So. Shetlands. VP8BD (ex-VP8AK) holds forth from Port Lockroy, Grahamland. VP8BF radiates from So. Shetlands and so does VP8BH (Deception Isle). VP8BC works Zs and Ws without much difficulty with his Falklands 7-Mc. 3-watter. VP8AZ barely managed to complete his WAS before closing down in late January; Mike also comments on the fine reception of WIAW's code practice and bulletins on 80 meters. South Sandwich hamming is nil with no prospects in sight, but South Georgia may see a new VP8 or two firing up shortly. VP8AY's first QSO from the Falklands was with W4YHD. . . . . W3AXT of DXerama fame points out that 7-Mc. c.w. candidates LU1XP 9YG and PY7RY represent very rare areas toward South American DX certificate awards.

Hereabouts — We regret to note the passing of inveterate DXers IIC2JR and YS1RP. HC2JR's radiotelephone DX and DXpeditionary (Galapagos Isles) achievements are all the more remarkable in view of his confinement to a wheel chair for many years. . . . . Servicing of Navassa Light now is done out of Miami instead of San Juan, P.R. KP4KD reports that this change puts the quietus on KP4TF's anticipated KC4 lark. . . . . Huge joint meets of NCDXC-SCDXC and FRC-PVRC outfits lived up to the wintry DX scene. Both affairs featured the appearances of various well-known DX personages and many yards of yarn were spun to the enjoyment and edification of all who attended. . . . . VP7NG, who has rolled up over 1400 QSOs with some 78 countries in just four months of Bahamas-style hamming, is coaching FG7XB on the finer points of the art. Glen also will provide Antoine with an ample stock of QSLs. VP7NG will remain on the air for another six months or so. . . . . Since November, 1945, KP4KD has knocked off different DX stations at a rate of slightly less than one a day — a 2912 total. . . . . First ticketed as 9AXS in '23, K6ENX has held numerous calls including Ws 3EHT 6NHC 0MWK and XU8MI. As XU8MI in Shanghai, 1939-1940, Otto's most memorable QSOs were with VP5PZ and W2BHW (now W8BHW) on 7 Mc. Now retired after 27 years of Navy service, K6ENX is hot on the DXCC trail. . . . . W1ATE, radiotelephone DX pundit in spades, becomes a Jersey W2 and doubtless will try his hand at a southern antenna plantation.

USED IN ALL 48 STATES!

## Self Supporting STEEL TOWERS For Rotary Beams, FM, TV

Width of Base Equal to 1/5 Height

Amateurs and commercial users alike — in every one of the 48 states and many foreign countries — have discovered why VESTO is the most famous name in towers! If you're not already a Vesto owner, write today for full information.

## ATTRACTIVE — NO GUY WIRES!

- 4-Post Construction for Greater Strength!
- Galvanized Steel — Will Last a Lifetime
- SAFE — Ladder to Top Platform
- COMPLETE — Ready to Assemble
- Easy to Erect or Move
- Withstands Heaviest Winds

## SMALL DOWN PMT.—EASY TERMS

Vesto Towers are available in a wide range of sizes to meet requirements of amateurs and commercial users alike. Note the low prices for these quality lifetime towers: 22'—\$104, 25'—\$127, 33'—\$149, 39'—\$182, 44'—\$208, 50'—\$239, 61'—\$299, 100'—\$895.

Towers are shipped to your home knocked down, FOB Kansas City, Mo. 4th class freight. Prices subject to change. . . . . so order now! Send check or money order . . . . . or write for free information. Cable address: "VESTO"

North Kansas City, Mo.

**HARRISON HAS IT!**

## 6 GOOD REASONS WHY YOU SHOULD OWN ONE, NOW!

1. It actually costs **LESS** to own the best! Subtract the traditionally high resale value of Collins equipment from its sensational low price, and you'll see how little it really costs per year to have the "Cadillac of the Amateur World."
2. It's as new as tomorrow! The advanced engineering of Collins makes the KWS-1 the ultimate in the modern mode of transmission—SSB—for many years to come.
3. It's a complete KW transmitter! VFO Exciter, VOX and push-talk control, blocked grid CW keying, regular AM, load matching output network, tubes, etc. are all included in the low, low total price of only \$1,995. Just plug in and operate!
4. I give you bigger allowances for your old gear! Shop around—I'll be glad to top any deal, no matter how crazy!
5. You need no money now! On the Harrison Easy Pay Plan, your present transmitter will usually cover the down payment, and you can spread the balance over **TWO YEARS**, while you are having the fun of using your Collins. (Everything is completely confidential.)
6. You only live once—so, why not enjoy the best!

### DO-IT-YOURSELF —and save!

Buy the VFO Exciter and its power supply, complete, ready to operate, for only

**\$895**

#### Power Supply

Use your own high voltage supply, or, we can supply the complete Collins kit with the lower cabinet (desk height) as shown, and all interconnecting cables, for ..... \$545  
Factory wired ..... \$700

Then, you can wire in the KW final amplifier, right in the space provided for it in the upper cabinet, where the sockets and shield are already mounted. Complete Collins kit of parts, blower, and detailed instructions, less tubes and power supply ..... \$ 215

Exciter, with KW final built in, by Collins \$1,225

### MAKE YOUR KW POUND THRU LIKE 7½ KW, with a

**TELREX**  
PRE-TUNED

3 Element, 20 Meter Beam!

Only \$120, complete with matching Balun. All ready to put up and plug in your RG-8/U coaxial cable. No tuning, no pruning, no fussing with matching. With TELREX you are buying proven performance with no guesswork.

**HARRISON IS HQ FOR ALL  
TELREX BEAMS 2 to 40 METERS**

## CASCADE CRYSTAL CONTROLLED CONVERTER

for 144 or 220 Mc.

### Provides:

- **HIGH SENSITIVITY** — Sensitivity better than 1/10 microvolt. Gain approx. 30 db. Noise approx. 4 db.
- **COMPLETELY STABLE** C.W. on 144 mc. NO mechanical modulation. Pure D.C. note. No drift.
- **RUGGEDLY BUILT** — Suitable for mobile application.
- **USE WITH ANY COMMUNICATIONS RECEIVER** — Availability with output at I.F. frequencies 6-10 mc., 8-12 mc., 10-14 mc., 12-16 mc., 14-18 mc. We recommend use at I.F. output 14-18 mc.
- **COMPLETELY SHIELDED** — In beautifully finished silver gray hammertone steel case.
- Available (SPECIAL ORDER) for other CD or industrial frequencies. Also available for Collins receiver.
- **USES 6BZ7, 2 — 6CB6, 2 — 6J6 tubes.** COMPLETE with plugs, tubes and crystal. **\$42.50**
- **Kit Form.** Complete. **\$29.75**

The following ECs reported that no SET was held: W1LKP (So. York Co., Me.); W3DUI (Luzerne Co., Pa.); W4CFV (Norton, Va.); W5LGY (Commerce, Texas); W5TGW (Lamb Co., Texas); W6JWD (Palo Alto, Calif.); W8OPU (Knox Co., Ohio); W9ZMU (Jo Daviess Co., Ill.). Give them credit for reporting, anyway. We should also mention that we received a message from W8DFC (EC, Princeton, W. Va.) indicating availabilities in his area. We have word from W8IPT that Montgomery Co., Ohio, participated in the SET, but nothing heard from the EC. Oregon SEC W7ESJ reports some SET activity in his section, although we have not heard direct from the ECs, except from W7ISP (listed above).

## OFFERS OUTSTANDING OPPORTUNITIES IN FIELD ENGINEERING

## New Edition!

Hot off the presses of Rand McNally comes this 1955 edition of the ARRL World Map. Loaded with changes that bring our "ham world" right up to the minute!

No active amateur can afford to be without one of these popular and useful adjuncts to good operating. Here is why the ARRL World Map is such a favorite:

As soon as you hear a DX station you can see exactly where he is—the country prefixes are not just listed in the marginal index; they're printed on the countries, themselves. You can tell his direction from you, and his distance. There's no question about which continent he's in—boundaries of the six continents are plainly marked.

The time zones are plainly marked, too. Call areas of thirteen countries are shown. Principal cities are designated. There's a scale of miles, another of kilometers. Printed on heavy map paper measuring 40" wide x 30" high, in 8 colors that really stand out, this new ARRL World Map is easily read from your operating position.

40" x 30" 8-Color Map, \$2.00, postpaid anywhere in the world

**PREFECT MFG. CO.,** 102 WESTPORT AVE., NORWALK, CONN.

## World Above 50 Mc.

(Continued from page 62)

**W5FPB, Albuquerque, N. Mex.** — Totaling 1954 v.h.f. activity shows 338 contacts with 45 different stations on 144 Mc., and 10 contacts with three stations on 432 Mc. With at least 45 stations available, there should be better attendance on weekly net meetings. All locals are asked to try to be active on 146.8 Mc. each Tuesday at 1930.

**W6NDR, Napa, Calif.** — WLSC reports conversion of 522 to 220 Mc., using the new 6524 in the output stage. Delivers considerably more output than with 832A.

**W7JHX, Port Orchard, Wash.** — Built phase-modulation exciter described by W1VLH in August, 1954, QST, and f.m. adapter for receiver. Checks with W7UVH, Olympia, who also has one of the exciters, show excellent results in comparison with a.m. Activity in V.H.F. SS best ever, but some scores low because of polarization problem. Switch to horizontal getting under way in Puget Sound area.

**W7JRG, Billings, Mont.** — 50-Mc. band open to W6 for at least three hours Jan. 29th. Heard W6s BWG KQO ABN NLZ and ILW. Abandoning s.s.b. on 50 Mc. after two years because of lack of favorable results. Too many operators on 6 do not recognize s.s.b. for what it is, and therefore make no attempt to tune it in properly. Inserted carrier method inefficient. Will be back on with a.m. rig essentially the same power as used so successfully from Sheridan, Wyo., some years back.

**W8WRN, Columbus, Ohio** — New stations coming on 144 Mc. all the time. New activity in Zanesville reported by W8JWV, and in Chillicothe by W8CSN. Interest in 220 Mc. also improving, with W8LGI and W8WRN looking for skeds on that band.

**W9DRN, Des Plaines, Ill.** — Had first crystal-controlled QSO on 432 Mc. Jan. 31st, after completing crystal-controlled converter. Uses 6AN4 r.f. stage, 6AM4 grounded-grid mixer, 6BK7 50-Mc. i.f. amplifier, into S-36. Transmitter uses 4X150A doubler from 220-Mc. rig, with frequency of latter brought down to 216 Mc. Work W9AGM, Chicago, regularly. W9ZQT and W9EFD also on 432 Mc.

**W9KQK, Elmhurst, Ill.** — Experimenting with 6AJ, F, M, and N4 tubes on 1215 Mc.

**W0QMF, Perryville, Mo.** — W0s LMK DFK RUF RTO QMF, and W9s PMN and KH in process of organizing 2-meter net. Also experimenting with duplex operation.

## ~~W~~ Strays

When W5QNK broke in on W5FAO and W5RRL on 75 meters, it became a real Baptist pastor's conference. W5QNK is pastor of the First Baptist Church, Chelsea, Okla.; W5FAO is pastor of the First Baptist Church, Vernon, Tex.; and W5RRL is pastor of the East Paris Baptist Church, Paris, Tex.

— — —

When W6HSZ goes on the air, strange things happen to his bath tub. It seems that it resonates around 75 meters. Whenever he's on 'phone with his kw., the bather, if there is one at the time, gets the surprise of a lifetime! More than once his signals have been modulated by a feminine scream. He plans to let the BTI (bath tub interference) stay as is — too much fun! — **K6BSW**

# The Palco BANTAM 65

The Smallest, Most Compact MOBILE TRANSMITTER with

65 W—Phone,  
90 W—CW

The Palco Bantam 65 is highly compact—4" high, 8" wide, 8 $\frac{3}{4}$ " deep—allowing for maximum leg room. It employs a separate modulator section on a chassis 2 x 2 $\frac{1}{2}$  x 11 inches that may be mounted wherever convenient. In addition, the Bantam 65 offers such outstanding features as . . .

- Built-in VFO with 2 crystal positions
- 6-12 V DC/110 V, AC operation
- Band switching—6 bands
- VFO and exciter stages are gang-tuned
- Pi-Section output
- Built-in antenna change-over and receiver silencing relay.
- Switch for high impedance or carbon microphone input
- Break-in operation on CW
- AB<sub>1</sub> modulation employing negative peak clipping
- Push-to-talk operation

For additional information, see your local distributor, or write to . . .

## YL News & Views

(Continued from page 55)

### Keeping Up with the Girls

W1WPO of Hq. adds the call of W2FZO to the list of YLs who are DXCC, published in our February column; Ginger has 100 on 'phone. . . . Each YL who has a bona fide QSO with K2BBW's OM, W2QAI, receives a real mink's foot along with Dave's QSL. . . . The new QTH of the YLRL chairman of the Sixth district, W6WSV, Carol, is 6852 Claire Ave., Reseda, Calif. . . . SCM for Eastern Mass., W1ALP, reports two new Novices: WN1DQF, Alice Perry, and WN1DRP, Phyllis Smith, XYLs of W1s BB and UOC respectively. . . . The new call of ex-W0YHD, Jenny, is K6JCL. . . . K6EXV, Lucille, K6HJZ, Jessie, and W9LAS, Rose, are now General Class. . . . VE2HI, Ethel, is a director of the Montreal A.R.C. . . . W9OTM's marriage to W9ODS raised the number of hams in June's family to five — mother is W9OTO, dad is W9OWD, and brother is W9MEM. . . . W9QMA, Dot, announces the arrival of a new harmonic in December. . . . New officers of the Long Island unit of YLRL are KN2EBU, pres.; W2KAE, V.P.; K2CFF, Secy.-Treas.; W2s KDP, UXM and KN2JHQ, board members. . . . New officers of the N. Y. C. YLRL Club are: Pres., W2IQP (relected); W2IGA, V.P.; W2MIV, Secy., Helen Zuparn, Treas. . . . W6QYL, Martha, home from an extended stay in the hospital, is operating 75 'phone from her bedside. . . . OM W6SXX/MM, aboard the liner *Hawaiian Rancher*, in the Port of Los Angeles for one week, worked sufficient YLs (10) to earn his Lads & Lassies Certificate from the L.A. YLRC. . . . W9LOY, Cris, reports the acceptance of new LARK members: W8ATB, W9s KFC, LDK; WN9IWP; W0LHP. . . . K6ANG, Billie, was elected Secy.-Treas. of the L.A. Council of Radio Clubs. . . . W6NAZ, Lenore, is editing a new YLRL directory, which will contain pertinent information about all YLRL members. Copies will be ready for distribution in April, and may be obtained by sending one dollar per copy to W6DXI, Gladys Eastman, 735 Glen Ave., Glendale 6, Calif. . . . W6QPI, Betty Gillies, is general chairman of the Ninth Annual All-Woman Transcontinental Air Race to be held in July. W1UKR, Eunice, is general radio chairman, with W2JZX, Vi, assisting. W6NZP, Evelyn, is radio chairman for Long Beach, Calif. . . . We were sorry to learn of the passing of W1UPZ, Helen M. Wright, Brookline, Mass., in January. . . . On Feb. 12th, 75 YLs and OMs enjoyed the annual YL-OM Valentine dinner banquet sponsored by the L.A. YLRC. Guests included VE3TEW, Ethel, and OM VE3TW; W9YWH, Evelyn; OM VK2US and family; and ARRL Southwestern Division Director Joos, W6PJU, Mildred, presided. . . . W6LBO, Mary, reports the following chairmen and committee members, in addition to those already reported, for the first YLRL International Convention: decorations, W6MFP; finance, W6NZP; program, W6QGX; prizes, W6KYZ; Sunday picnic, W6WSV and K6EIA; housing, W6JZA and K6ANG; favors, W6QYL, W6DXI, K6GMX, KN6EJE.

### HAMFEST CALENDAR

CONNECTICUT — The Tri-City Radio Council will hold its eleventh annual hamfest at the Crocker House, New London, on April 16th — attendance by advance reservation only, \$3.75. R. Y. Chapman, W1QV, General Chairman.

MINNESOTA — The Southwestern Minnesota Radio Club will have a dinner and a program featuring talks and demonstrations on April 30th, 6:30 p.m., at the Minnesota Cafe and J. C. Hall, in Marshall.

NEW JERSEY — The tenth annual Old Timers' Nite Round-Up and Banquet, sponsored by the Delaware Valley Radio Association, April 23rd, in the grand ballroom of the Stacy-Trent Hotel, downtown Trenton. Dinner served promptly at 6:30 in the ballroom. Tickets by reservation only, \$5.00. General Chairman, E. G. Raser, W2ZI.

PENNSYLVANIA — April 16, the Arcadia Cafe, 27 West Orange St., Lancaster, the 10th annual banquet of the Lancaster Radio Transmitting Society. Activities start at 2 p.m. with contests and entertainment for the OMs, YLs, and XYLs. Dinner at 6:30. Registrations are in advance and may be obtained from A. C. Jacoby, W3OY, 589 No. Plum St., Lancaster.

# add POWER to S.S.B. with adams

Have you heard WOHN - W2JXH - W2DR - W9ARK - KV4BB - W4UEL? These are some of the stations on the air with 55B - "adams" 55B Listen to these fine signals on the air and you will buy an "adams" Final. Here are the specs. — Compare.

## adams 1010 - 1 kw

Tube: One 4-400A

The low-power driving requirements of the 4-400A tube class AB1 lends itself admirably for use with exciters of 4 to 5 watts output.

The series 1010 is a front panel band-switching amplifier with a pi-network tank circuit incorporating a variable vacuum capacitor, forced-air cooling, and complete shielding. Grid circuit: High efficiency band-switching turret.

Power Supplies: Front panel controlled, regulated grid bias and screen supply. Well filtered 3000V @ 400 ma plate supply.

## 400 WATT & 1000 WATT DC INPUT LINEAR AMPLIFIERS

Metering: Four large 3 in. square meters are provided for simultaneous and continual metering of plate voltage, plate current, screen grid current, and grid current.

Size: The entire 1 KW amplifier with its bias and screen power supplies are contained in a shielded compartment 19" W x 14" H x 13" D. The entire amplifier with its high voltage power supply comes installed in a table top cabinet 35" high x 22" wide x 14 3/4" deep.

Price: 1010-KW Linear Amplifier  
\$875.00  
Less power supply & cabinet  
\$650.00

## adams "410"

Price: 410 - 400 Watt Linear amplifier  
\$295.00  
Price: 420 - 400 Watt Band Switching  
Linear amplifier  
\$335.00

## Electronic-Key Manipulator

(Continued from page 35)

ease of operating, while still simple and within the ability of the average amateur to build. The design arrived at is presented here, and after some experimenting with the completed key for the correct adjustment, this design has stood up for a couple of years now.

An Army surplus Model J-36 key is the basis for the key built here. When revamping this model Vibroplex the staff support structure was turned 180 degrees from its original position. Two new holes were drilled in the base to match the mounting holes. Two more holes were drilled at the opposite end to mount the posts for the dot and dash contacts. As a rule some  $\frac{3}{8}$ -inch stock can be found in the shack and posts made as required. These two posts are insulated from the base and wires are connected to them. The third or common wire is connected at the mounting screw of the staff support structure. Be sure that the resistance checks at infinity on an ohmmeter or trouble may result in the time-constant circuits of the electronic key. The three wires are connected to a microphone plug.

The arm or reed is cut from a piece of duralumin. It is stiff and springy — the sort used in aircraft construction and obtainable from a war-surplus store. Do not use soft aluminum as it is too easily bent. A steel reed will be too heavy and will cause undue vibration, since the reed has to be highly damped; for the same reason, keep the weight to a minimum at both ends.

On the contact end a small hole is drilled to match the contact posts and a piece of silver or contact material is forced or wedged in and left extending a bit to ensure a good contact at the points. The hole for the staff is drilled a thousandth smaller and the staff is pressed in. If a drill press is available, the following is a method of assuring a good fit: Clamp the reed in the drill press vise and with a drill ten thousandths smaller than the finished hole drill with a fast speed and easy feed. Every  $\frac{1}{8}$  inch or so withdraw the drill and clean off the chips. Use a thread-cutting oil if possible. After the first hole is drilled, redrill with the finish drill. Leave the reed in the drill press vise and chuck the staff in the drill press; then press the staff in to the desired depth. A good hardware store will be glad to measure the staff with a micrometer and furnish drills of the right size. Also, while at the hardware store, buy a  $\frac{1}{8}$ -inch center drill and use it to true up the tapered bearings of the

(Continued on page 148)

# ORIGINAL VAARO MOBILE PRODUCTS NOW MADE BY DAVIS ELECTRONICS

## ORIGINAL VARIABLE SINGLE UNIT COIL

For 75-40-20-15-11 and 10 METER BANDS. NOW IN THE 1955 DESIGN with the NEW, IMPROVED "DUAL CONTACT" between the coil windings to provide a greater, more positive, more efficient contact. Coil can be INSTANTLY TUNED to ANY DESIRED BAND or FREQUENCY by ingenious locking device. Factory preluned. Continuous coverage from 3750 kcs. to 30,000 kcs. Highest "Q" available in an all-band coil. Fits all whips and bases.

MODEL V-102B—for 0 to 500 watts input

**\$14.95**

MODEL V-103B—for 0 to 1000 watts input

**\$16.95**

**VAARO BUMPER MOUNT** Eliminates cutting holes in your car. Fits any antenna and car bumper. **BUMPER CURVATURE INSERT** exactly fits your make and model of car. Socket dimensions: Standard  $\frac{3}{8}$ " x 24 thread. Has .500 thick fibreglas disc of top dielectric material. MODEL V-105. Cast aluminum. Hammerstone baked enamel, **\$13.95**

**MODEL V-105V. VAARO "WHIP FLEXOR"** keeps whip perpendicular at high speeds—thus no change in loading or impairment of reception. Cuts down bad "QSB" action on receiving end. Whip can be brought into horizontal plane for car storage, etc. Has strong cadmium-plated square steel wire spring. Only **\$3.95**

The DAVIS-VAARO Line also includes: FIBREGLAS WHIPS—6' \$8.50, 7' \$8.75, and 8' \$8.95. Also BASE SECTIONS (Solid Hex); 12" \$3.75. 24" \$3.95. 36" \$4.95.

**VAARO "WHIP CLAMP"** — Securely fastens to roof water-drain of any car without damage to finish. Fastens whip securely down to car roof level for storage, low wooded areas, etc. Solid brass, chrome plated. Installed in 30 seconds. **\$1.79**

## JOHNSON "R" CAPACITORS

. . . for that compact portable or mobile rig!

TYPE "R"

Sturdy units with extra heavy steatite stator supports, soldered brass plates and heavy nickel plating. Double bearing construction allows ganging two or more units. Threaded chassis mounting feet as well as a heavy threaded rotor bearing with mounting nut permits exceptionally sturdy mounting. Smooth operation at high frequencies is assured by use of a silver plated rotor wiping contact. Models available with maximum capacities from 20 to 140 mmfd. Plate spacing, .024" rated at 1200 volts DC breakdown.

**TENNALAB • Quincy, Illinois**

support. Also true the staff bearing surfaces if worn. Sloppy motion must be kept to a minimum, because tolerances are close.

The springs which act against the reed were purchased in an auto parts store and although they are only about  $\frac{1}{8}$  inch in diameter they are very stiff and it is difficult to compress them between your fingers. Buy the stiffest spring possible in that size.

We are all different in our individual tastes, so thought has been given to meet as many fists as possible. The present design, I feel, will meet the requirements of a fast operator with a light touch. A slower operator or a person with a heavy hand who likes a lot of swing will need to move the two spring-supporting posts about  $\frac{3}{8}$  inch nearer the fulcrum of the key, as well as to use a spring of lighter tension. However, between the two positions and different springs I believe most conditions can be reached. The contacts as shown can be adjusted to a very few thousandths of an inch and the paddle only requires a whisper to move, but still the reed will center each time with no vibration.

The two adjusting screws near the paddle are there for the sole purpose of preventing damage to the reed from a person who has a heavy touch, or takes his wrath out on the bug instead of himself. As *QST* mentioned, adapt yourself to the bug and let it set the pace — you will never make it otherwise.

## Correspondence

(Continued from page 52)

entitled *Historic Towns of the Connecticut River Valley*, published in 1906. I ventured no further than page 7 which discussed the five Indian tribes of the Connecticut Valley, one of which was the Podunk tribe situated at what is now East Hartford. A very enlightening discussion, I felt, and a very subtle explanation of the "Podunk Hollow Radio Club."

Hats off to all of you of the "Hollow" (despite your being in West Hartford) for your knowledge of Connecticut history — and to Gil for his portrayal of the club.

— Jim Talbut, WN3ZLD

## DX RCC

1223 Ninth Ave., South  
Escanaba, Mich.

Editor, *QST*:

With regard to "Tips on Working DX" in the February issue, I should like to voice a small objection — in part. I realize that rare DX should be treated accordingly and all lengthy QSOs ought to be eliminated so that as many as possible may benefit from working the particular station.

However, in general, DX contacts can often contribute greatly to the amateur in many important ways if longer rag-chewing is made possible through favorable conditions, etc. The promotion of international goodwill and the exchange of common knowledge, operating and construction hints, everyday comment about topics of mutual interest, all provide one of the most rewarding aspects of amateur radio. Our DX contest is the time for the quickest QSOs, of course, and I am convinced that at other times, when possible, a more extended, friendly contact will be of great benefit to both parties concerned.

As a high-school instructor of social science, I have derived considerable value through the interchange of ideas and concepts through the medium of amateur radio, and lately have become very much aware of the possibilities on a truly international scale.

— Donald W. Ickes, W8NSX

## NEW EXAM

East Main Street  
Barnesville, Ohio

Editor, QST:

The following is suggested as a 1957 amateur license examination, if the present trend in FCC policy continues to its logical conclusion:

CODE: A dot plus a dash equals "A" ( ) Yes ( ) No  
LAW: You must have a license before you transmit.

( ) Yes ( ) No

THEORY: Ohms and volts are different ( ) Yes ( ) No

PRACTICAL: Do you have \$2500 to invest in a factory-built rig? ( ) Yes ( ) No

Do you intend to have an electrician install this rig? ( ) Yes ( ) No

If the answers to the above questions are "yes," what call do you want? Please give second choice.

— Harold S. Davis, W8EOY

## NO RECIPROCITY

233 Appleton St.  
Lowell, Mass.

Editor, QST:

Most of us hams eagerly devour a QST yarn spun by that Prince of Hamdom, the DX-peditioneer, who, though the W pile-ups were rougher than a stucco bathtub, endeared himself more than somewhat to the DX fanciers among us by his generous provision of wall insulation.

If verbose, he will majestically expound on all subjects from how his rig loaded to the exotic native remedy for snakebite and how to obtain same.

Certainly though he will explain how he came to be there. Disregarding his personal problems and those of transport, we read that some beneficent foreign authority gave him permission to operate.

As we avidly read his tale does it occur to us that under our present ham regulations the turnabout which is fair play simply cannot occur? We find that, except in the case of Canadian hams, operation is barred to all but citizens.

Among us there must reside scores, if not hundreds, of responsible businessmen, students and scientists, whose keys are gathering rust because of these one-sided regulations. The "Passport Ham" suffers but these provisions handicap us also in negotiations for permission to fire up on foreign soil.

Contrary arguments based on "security reasons" are not valid as with proper screening our present leaky security net would not be enlarged in gauge.

"Send me your hungry, your stormtossed, your huddled masses, etc." does not seem to apply to the case of the visiting ham.

— John L. Gilbo, W1SSZ

## QRP MOVEMENT

St. Bride's Presbytery  
Cowdenbeath, Fifeshire  
Scotland

Editor, QST:

I wonder if the ARRL would be prepared to initiate a QRP movement amongst hams. When we look at conditions on the ham bands today, it seems to me that it will only be by a return to (say) a maximum of 150 watts that order is going to be restored.

If some of the W stations had their QTH here in G-land and could listen to the 14-Mc. band when the DL4 stations are in full swing with their BC-610s and ET-4336s, they would see my point of view. To overcome these, some of the Continentals are jacking up their power, and the result is sheer bedlam. My present reaction is to trade in my equipment for a camera or butterfly-catching equipment since DX work is out of the question with high-powered DLs and high-powered (and often badly modulated) Continentals. What will happen if the 1-kw. transmitter ever becomes standard equipment. Well, my imagination boggles at the thought. When chasing the DX, could not such stations reduce power and thereby show some consideration for those whose power is limited by law?

To me, this tendency to increase power will eventually destroy the true amateur spirit. Instead of a real DXer, experimenting and building his own, in a few years' time he'll be forced to spend, e.g., \$3850.00 for a 1-kw. transmitter and \$1075.00 for his receiver. If he cannot afford to

## TRANSITRON "500" LINEAR AMPLIFIER

Designed By Hams — To Serve Hams Better

HERE is an "honest to goodness" power-laden linear amplifier that comes right out of the design facilities of Transitron, Inc. So easy to operate, the Transitron 500 is a compact, fully shielded unit, ideally suited for single side-band operation.

IT HAS no plug-in coils, and features a minimum number of tuning adjustments. Field tests have proven the "500" to be of low harmonic output, free from parasites, and with excellent stability on all bands.

- Single Side-Band Operation
- Continuous tuning from 3.5 to 30 MC
- No Plug-In Coils
- Driving Power Required: 5 watts
- Low Harmonic Output

do so, he can kiss the DX good-by. And how many hams can afford to spend \$5000 on their rigs?

Please do not think that this is an isolated opinion; there are many who think as I do. This opinion is not to be regarded as just another example of anti-American feeling in Britain.

— Rev. S. J. Smith

### SWL REPORT

Union & Stony Point Rd.  
Rochester 11, New York

Editor, QST:

Last year I received over 500 SWL cards. Other stations with greater operating hours have accumulated a greater total than this. I do not disapprove of this practice but wish to encourage the reporting in the right direction.

The average SWL, and future amateur, picks out easily readable signals within the popular 'phone bands and sends a card. The operator at the other end is well aware that he is getting out both through actual contacts and the deluge of SWL cards. Why doesn't the short-wave listener dig down under and pick out the weak signals? Likewise, as a potential amateur, he should spend time listening in the c.w. bands.

The low-power 'phone or c.w. station will appreciate that SWL card far more than one of the high-power boys and the chance of receiving a reply is far greater.

— B. Kelley, W2ICE

### Receiver Hints for V.H.F.

(Continued from page 37)

approximate that of the bandspread dial. On most receivers this gadget is helpful for applications in addition to use with v.h.f. converters. It makes fishing for stations outside the ham bands more enjoyable, and it preserves the calibration of the general-coverage dial, which is upset if the bandspread dial is used as a vernier.

How badly a receiver needs such an accessory depends on several factors. One is the number of positions on the bandswitch; in other words how much frequency is covered on each tuning range. The small inexpensive receivers generally have four bands. They *require* the vernier mechanism. Some have five positions, but a fast tuning rate. They need it, too. Several medium-priced receivers have five positions and a good tuning rate. They benefit from the vernier drive, but they *can* be tuned accurately without it. The NC-173 and 183D are in this category. A few receivers have six bands. The HQ-140-X and SX-88 are two we've tried that tune quite well without vernier attachments. On Band 4 both receivers cover just a little more than 6 to 10 Mc. If the converter crystal frequencies are altered slightly from *Handbook* specifications, you have coverage of a band with a full sweep of the general-coverage dial.

Any planetary drive can be used. The National Velvet Vernier is one we've used several times. A mounting for the Type AM is shown in the second photograph. This gives the same tuning rate as the Croname type 599, but the latter has the advantage of permitting either direct drive or 5-to-1 reduction. The knob assembly supplied by the manufacturer can be used, but we prefer something larger. The lash-up shown in the first photograph was made by drilling out the center of a National HRT knob to pass the direct-drive portion of the 599 shaft. The knob on the vernier-drive shaft is a National type HRT-M. Many other combinations can be made up to take care of individual tastes or available parts stocks.

# FACTS ABOUT LEARNING **CODE**

*Now* — A PROFESSIONAL TELEPLEX IN  
THE NOVICE PRICE RANGE

**S**ENDS correctly timed signals from 5 words to 70 words per minute. Sixteen lessons. Its 110 volt A.C. motor makes it hold an even, steady speed. Code is received on the air over headphones; therefore, it should be learned with oscillator and headphones. Furthermore, an oscillator is an excellent device with which to learn sending.

**Y**OU get **TELEPLEX TWO PHASE, STEP BY STEP** instruction. That means first you train your EAR to HEAR the signals in the same manner you hear spoken words. You learn only a few letters at a time. You advance step by step in an orderly manner. You may select for concentrated practice characters that give you trouble. You are never confused by jumping from one character to another without sufficient time to thoroughly learn the sound.

You get plenty of cipher groups that you will never memorize. Speed up to 25 words is child's play with TELEPLEX. Forty to fifty words certainly is within reason.

*Send postcard for brochure describing MASTER TELEPLEX, the only Code Teacher that records your own signals so that you can see and hear just how you make your signals. (See it at Blan's, 64 Dey St., New York.)*

**NOVICE SPECIAL** with 16 Lessons \$15.95 prepaid. Built-in oscillator with radio tube \$6.00 extra. Complete oscillator kit with tube; you wire it up \$4.00 (Oscillator or kit not sold separately.) Get it from your dealer or order direct. State your present code speed if any.

**TELEPLEX CO.** 415 G. Street  
Modesto, California

## ULTIMATE KEYER

Manufacturing rights under U. S. Pat. No. 2,658,946 now available. Assignment considered. See patent for application to tape transmission. Contact **John Kaye**, 2296 W. Nicolet St., Banning, Calif. or Berkeley & Scantlebury, 530 W. Sixth St., Los Angeles 14, Calif.

## THE LEAGUE EMBLEM

With both gold border and lettering, and with black enamel background, is available in either pin (with safety clasp) or screw-back button type. In addition, there are special colors for Communications Department appointees.

- ▶ Red enameled background for the SCM.
- ▶ Green enameled background for the RM, PAM or EC.
- ▶ Blue enameled background for the ORS or OPS.

**THE EMBLEM CUT:** A mounted printing electrotpe,  $\frac{5}{8}$ " high, for use by members on amateur printed matter, letterheads, cards, etc.

# HAM-ADS

(1) Advertising shall pertain to radio and shall be of nature of interest to radio amateurs or experimenters in their pursuit of the art.

(2) No display of any character will be accepted, nor can any special typographical arrangement, such as all or part capital letters be used which would tend to make one advertisement stand out from the others. No Box Reply Service can be maintained in these columns.

(3) The Ham-Ad rate is 30¢ per word, except as noted in paragraph (6) below.

(4) Remittance in full must accompany copy. No cash or contract discount or agency commission will be allowed.

(5) Closing date for Ham-Ads is the 20th of the second month preceding publication date.

(6) A special rate of 7¢ per word will apply to advertising which, in our judgment, is obviously non-commercial in nature, and is placed and signed by a member of the American Radio Relay League. Thus, advertising of bona fide surplus equipment owned, used and for sale by an individual or apparatus offered for exchange or advertising inquiring for special equipment, if by a member of the American Radio Relay League take the 7¢ rate. An attempt to deal in apparatus in quantity for profit, even if by an individual, is commercial and all advertising by him takes the 30¢ rate. Provisions of paragraphs (1) (2) and (5), apply to all advertising in this column regardless of which rate may apply. To expedite handling of your copy please state whether you are a member of ARRL.

(7) Because error is more easily avoided, it is requested signature and address be printed plainly. Typewritten copy preferred, but handwritten signature must accompany all authorized insertions.

(8) No advertiser may use more than 100 words in any one issue nor more than one ad in one issue.

*Having made no investigation of the advertisers in the classified columns, the publishers of QSL are unable to vouch for their integrity or for the grade or character of the products or services advertised.*

WANTED: Gonset 3-30 converter; also 1946 ARRL Radio Amateur's Handbook. Please quote price in first letter. W7WLB, 2120 E. Grant Rd., Tucson, Ariz.

SELL: Sonar XE-10 \$12.00; McMurdo Silver wavemeter, \$4.00; W. E. handsets \$2.00; 4 x 5 Graflex F.P.A., \$3.00. Samkofsky, 264 Division Ave., Brooklyn 11, N. Y.

PORTABLE 15-watt 10 mtr. phone xmitter (crystal and mike included); (telescoping 82" ant.); 400V. Vibrapack, metered, all built into aluminum carrying case. Designed to plug into car cigarette lighter, ready transmit. Will sacrifice for \$50. W3TNX, Groff, 120 Westland Drive, Pittsburgh 17, Penna.

SELL: BC-221, new, guaranteed, \$100. Wilson, 4624 Woodfield Rd., Bethesda, Md.

FOR Sale: Heathkit transmitter AT-1, \$25; Heathkit VFO VF-1, \$15; Eldico modulator MD-40, \$30. All in gud condx. Peter G. Montague, The Choate School, Wallingford, Conn.

FOR Sale: Bandmaster Deluxe with power supply and VFO, in new condx, \$125. Complete NC57 receiver, \$55. W9KRMZ, 21 E. Brayton St., Chicago 28, Ill.

CRYSTALS: Marine, aircraft and general communications frequencies. Write for information. C-W Manufacturing Co., Box 2065, El Monte, Calif.

SELL: Heathkit transmitter, \$27.50; excellent VFO, \$24.50; MS-710 code practice oscillator, \$5.50; antenna tuner, \$3.50; clean 1939 Chevrolet for mobile use, \$150. K2BAY.

SELL Bandspread coil sets AA and AC fit late models HRO receivers, both for \$22.00. In perfect condx. W3BFF.

FOR Sale: Eico tube tester #625, with ph tube adapter, \$32; Eico condenser checker #950, \$16.50; Eico battery eliminator, #1040, \$17.50; all units factory wired, excellent. Prices f.o.b. Henry Mohr, W3NCX, 1005 Wyoming St., Allentown, Penna.

FOR Sale: Complete 1 Kw xmitter, built to commercial standards, in enclosed rack. Remote Collins 310B-1 drives pp 813's; coils for 80, 20 and 10; D-104 mike; self-contained speech amplifier and self-contained pp 805's modulator. Best cash offer as unit. W9DGM, 1636 S. Biltmore St., Indianapolis, Ind.

FOR Sale: HT-9 with coils for 80, 20, 10, \$135; Millen Variarm, \$15. W9MQO, Windom, Minn.

RUBBER Stamp with your call letters, name and address, \$1.50; stamp pad thirty-five cents. El Kay Stamps, Box 5-WT, West Toledo Station, Toledo 12, Ohio.

FOR Sale: Complete ham station 3 months old, including factory-wired Johnson Viking Ranger, Hammarlund HQ-140X, Telrex 20-meter Mini-beam, CD TR 4 rotor, mike and bug; \$450.00. Don Heller, K2JQX, 31 Joyce Rd., Tuckahoe, N. Y.

FOR Sale: Johnson Matchbox, never used! In original carton, with manual; \$38.50. Bill McFarlen, W8KJC, 1015 Lake Park, Birmingham, Mich.

SELL: Meissner 150-B transmitter. Speech amplifier included; \$130 or highest offer. Also, 3000 volts at 400 mil. pwr supply, Variac, H.V. meter, 866-A; \$75. Both units delivered within 150 miles of Boston. W1WXC, 24 Monument St., Concord, Mass.

TRADE: Lysco 600-S, guaranteed TVI suppressed, and Kodak Speed Graphic for de-TV'd Viking I, or will sell xmitter for \$100. W8SHG, Collins, 416-B Montrose Dr., South Charleston, W. Va.

SELL: QSTs, October 1939 through December 1954, complete, \$35.00 or best offer; also CQ August 1946 through December 1952, complete, except two issues; \$12.50 or best offer, all F.o.b. Merrick, N. Y. Mark Devaney, W2NQR, 61 Henry St., Merrick, L. I., N. Y.

LYSCO 600, in perfect condx; \$80. Roger Simmons, W8OZL, 338 Walnut, Ashland, Ohio.

S-76 Hallcrafters, in exc. condx; modified per Nov. '54 QST, excepting tuning dial changes. Looks like factory work. Best offer over \$100. F.o.b. Terre Haute, Ind. Arthur Drake, W9QPD, 17 Marigold Dr., Terre Haute, Ind.

COLLINS 32V3; \$595; 75A3, \$425 — both: \$995. Perfect condx. Thurston, W9BCG, Lake Forest Academy, Lake Forest, Ill.

FOR Sale: Eldico MD40P modulator, power supply, excellent; \$45.00; B & W Balun coils, wired mounted; \$5.00. Dr. L. C. Silvern, K2BNI, 16 Mountainview Ave., Albany 8, N. Y.

FOR Sale: Benox automatic bandswitching transmitter, 100 watts, fone/c.w.; also BC459 and BC455. Will swap for NC-183. Hoffman, W8ET, 366 Canterbury Road, Bay Village, Ohio.

SELL: 250-watt rig, including osc.-buffer, pr. 813s final, sp. ampl., modulator, two 1000v., and 2 low voltage pwr supplies, switching panel, 10-160 meters; \$100.00 takes all. Walt Keen, W2SGN, 37 Dewitt St., Lowville, N. Y.

FOR Sale: From estate of W5DM: HRO-60; complete KW transmitter, mobile equipment. Write to W5NW, Box 586, Odessa, Texas.

COLOSSAL — See the Hamfest notices for information on the annual "Western New York Hamfest" offered by The Rochester (N. Y.) Amateur Radio Association on Saturday, May 21st.

WANTED: Instructor for Radio, Television servicing with ham license, negro, Salary \$80 per week, split shift. Davis Trade School, 607 So. 10th St., Louisville, Ky.

ENGINEERING Degrees, E.E. major electronics earned through home study, American College of Engineering, Box 27724 (D), Hollywood 27, Calif.

VIKING II with Viking VFO, low pass filter, antenna relay, D104 mike, built-in push-to-talk, factory-wired; \$325.00. Hallcrafters SX-28 with bass reflex speaker; \$125.00; 2-element 20-meter beam, 40 ft. aluminum tower, prop pitch motor, transformer and cable; \$125.00 (or best offer). David Greene, 20 Vernon Ave., Newark 8, N. J. Tel: Essex 2-6411.

FOR Sale: Globe Champion transmitter, \$200.00; Instructograph, \$10.00; Howard receiver, \$25.00. B. J. Parisi, Box 1005, Onset, Mass.

SELL: Proceedings of the IRE: September 1947 through December 1954. Also engineering texts. Write for list, J. Woestman, 331 Leconey, Palmyra, N. J.

## Test your QRK\*

THIS little quiz is based on articles appearing in *QST* for February. How much do you remember from the issue of two months ago?

1. Signals may be monitored directly, through use of a monitone, or by use of what device?
2. A new approach to variable selectivity makes use of —.
3. What circuit can double in the final without loss of efficiency?
4. Cheap yet suitable chassis for lightweight accessories can be made from what common articles?
5. What method can be used to vary directivity of a vertical antenna system?

Some of these questions can be answered from a knowledge of radio theory; others require straight memory. Let a complete file of *QST* serve as your "memory" while it fills in your knowledge of basic principles. Why not have *QST* delivered to your door each month?

### QST and ARRL Membership

**\$4 in the USA \$4.25 in Canada**

**\$5 elsewhere**

**The American Radio Relay League, Inc.**

West Hartford 7, Conn.

ANSWERS: 1. A second, keyed BFO (A C.W. Man's Control Unit, page 11) 2. Two half-lattice filters and a VFO (A Variable Bandwidth Filter, page 17) 3. A push-push stage (A Three-Band Multiplier-Driver, page 20) 4. Tinned kitchenware (The Baking Pan Wavemeter, page 32) 5. Switched Phasing (A Steerable Array for 7 and 14 Mc., page 28)

### \* QRK — QST Reading Knowledge.

It is also the International Q-Signal meaning "Your readability is . . .". You'll find *QST* always QRK 5 — Perfectly Readable.

# when you're consulted on HI-FI look to **ALLIED** for systems and components

## Typical ALLIED Hi-Fi Values

### "Space Saver II" Hi-Fi Phono System

Here's authentic Hi-Fi performance that fits in the smallest available space. No cabinets required. Carefully matched components just plug in. System includes: Knight 12-Watt Amplifier (featuring 3-position record compensation, bass and treble controls, loudness-volume control, response  $\pm 0.75$  db, 20-20,000 cps at 12 watts) in handsome metal case only  $3\frac{1}{2} \times 13 \times 10\frac{1}{4}$ "; Webcor 1127-270 3-Speed Changer (9 x 14 x 14" in Russet and Beige or Burgundy and Beige) with G.E. RPX-050 magnetic cartridge and dual-tip sapphire stylus; Electro-Voice "Baronet" folded horn enclosure with SP8-B speaker in mahogany or blonde finish ( $22\frac{7}{8} \times 14\frac{1}{2} \times 13\frac{3}{4}$ "). Ready to plug in. Hi-Fi record included. Specify colors.  
**94 PA 159.** Net only.....\$157.95  
**93 SX 312.** Knight 12-Watt "Space Saver" Amplifier only.  
 Net only.....\$59.50

### New Knight 728 FM-AM Tuner—Our Top Value

Designed to ALLIED's highest specifications—equals the best at incomparably low cost. Maximum AM reception, thrilling on FM. Features: AFC on FM—"locks in" the station; two simple controls; sensitivity—FM, 5 mv for 20 db quieting, AM, 5 mv for 1 volt output; response, 50-15,000 cps,  $\pm 1$  db; tunes FM, 88-108 mc, AM, 530-1650 kc; output level—FM, 4 volts high imp., AM, 1 volt high imp.; hum, 60 db below output; outputs for amplifier and tape recorder; 300 ohm FM antenna input, AM, high imp. loop or antenna. Only  $5\frac{1}{2} \times 13\frac{3}{8} \times 7\frac{1}{2}$ " deep. Complete with FM-AM antenna.

**94 SX 728.** Net only.....\$89.50

**94 SX 729.** Tuner as above in handsome black and gold finished metal cabinet.  $6 \times 13\frac{3}{8} \times 8\frac{3}{8}$ ". Net...\$95.50

*Amateur Radio Station Log*  
*you can't log 'em*  
*if you can't hear 'em!*

No matter what else a receiver does, it must pull 'em in! And that's just what the NC-183D does! Compare its 1uv sensitivity (on 6 meters) and extremely low noise level with the highest-priced amateur receivers made (\$150 higher!) and you'll see why you'll hear more, log more on an NC-183D!

**COVERAGE:** Continuous from 540 kcs. to 31 mcs. plus 48 to 56 mcs. for 6-meter reception.

**FEATURES:** Two tuned R.F. stages. 3 stages of I.F. Voltage regulated osc. and BFO. Main tuning dial covers range in five bands. Bandspread dial calibrated for amateur 80, 40, 20, 15, 11-10 and 6-meter bands. Bandspread usable over entire range. Six-position crystal filter. New-type noise limiter. High fidelity push-pull audio. Accessory socket for NFM adaptor or other unit, such as crystal calibrator.

**\$399.50**

NC-183D

### PRECISION-WOUND RF CHOKES

National makes a complete line of quality RF chokes, covering virtually every frequency range and every electronic need. In addition, National's engineering staff and production facilities are capable of winding chokes to any specifications for commercial or military applications. Write for complete information.

## —USE RCA TUBES

For instance, look at the Barker & Williamson "5100" in this picture.

Known throughout the bands for the authoritative signal it packs, this transmitter uses two RCA-6146's in parallel in the "final"—and two more RCA-6146's in the class AB modulator.

Here are basic reasons why leading amateurs—and commercial designers like B&W—specify "RCA."

RCA power tubes make it practicable to get any power you want—at relatively low plate voltage. RCA power tubes are built to handle peak plate loads with ease—have tremendous reserve emission. RCA power tubes are economical *in service!*

You can get RCA high-perveance power tubes—beam power types and triodes—from any RCA Tube Distributor. You can get technical data on any particular type from RCA, Commercial Engineering, Section D37M, Harrison, New Jersey.

◀ Final amplifier of the B & W 5100, using two beam power RCA-6146's in parallel.

▶ 90 watts ICAS input on CW; 67.5 watts on 'phone. In class AB modulator service, two RCA-6146's can deliver 120-130 watts ICAS.

# ADD HIGH FIDELITY TO YOUR HOBBY

## *for all the family TO ENJOY*

### On-the-air or Off-the-air...

This natural extension of your hobby provides a new source of pleasure for your entire family. And with the "know-how" you already have, it is easy to put together a true high-fidelity system that gives thrilling, lifelike music reproduction. Just as E-V microphones and other equipment are widely used in amateur and commercial communications...so have E-V high-fidelity reproducing components and systems achieved high recognition for their outstanding quality. Shown here are a few typical examples.

**The Aristocrat.** Folded-horn corner enclosure. Designed for E-V or any full-range 12-in. speaker or E-V separate 2-way or 3-way systems. Unusually smooth reproduction down to 35 cps. Selected mahogany veneers. Size: 29-5/8 in. high, 19 in. wide, 16-5/16 in. deep.

Mahogany Net: \$66.00  
Korina Blonde. Net: \$72.00

**Model A20C Circotron Amplifier.** Has all necessary inputs and controls for handling a complete high-fidelity system. Power output 20 watts rated, 40 watts on peaks. Frequency response  $\pm 1$  db 20-20,000 cps at full 20 watts. Size: 10 3/4 in. wide, 11 3/4 in. deep, 7 3/8 in. high.  
Net: \$110.00

**Model 12TRXB Triaxial Speaker.** Integrated 3-way speaker system combines E-V T35B Super Sonax, Radax Propagator, and large bass cone with heavy magnet in one compact, concentric assembly. Response 35-15,000 cps in recommended Aristocrat enclosure. With level control for VHF driver. Net: \$59.70

**Model 84 Ultra-Linear Ceramic Cartridge.** Flat response  $\pm 2\frac{1}{2}$  db from 20 to 15,000 cps. No preamplifier required. No inductive hum pick-up. No microphonics. High-level output. For microgroove 33 1/3 and 45 rpm.

**Model 84D.** With Diamond Stylus. Net: \$23.10  
**Model 84S.** With Sapphire Stylus. Net: \$ 9.60

### NEW SERVICE-DESIGNED 6BG6-GA

Diameter 24% less than prototype! Seated height 13% less! See X-ray pictures at right for standout design improvements in General Electric's new tube—priced same as the 6BG6-G it replaces!

NEW 6BG6-GA

OLD 6BG6-G

1. New bulb is straight-side, much smaller and sturdier.
2. Redesigned, more shock-resistant tube structure.
3. Bottom mica, as well as top, now contacts the glass envelope, for greater rigidity.
4. Button-stem base gives shorter, better-separated leads, for improved heat conduction and superior tube r-f characteristics.

## For mobile work, choose G.E.'s all-new 6BG6-GA... compact, sturdy, high-voltage tested!

ONE tube or push-pull, the 6BG6-GA is ideal for your new mobile or portable rig—final-amplifier or modulator service.

General Electric's new beam power pentode is streamlined in size, and as rugged as they come. The tube takes tough mobile operating conditions in stride. A high peak plate voltage rating means you'll have little or no tube arc-over from voltage fluctuations. To further assure this, every G-E 6BG6-GA is factory pulse-tested at absolute maximum voltage.

20-watt plate dissipation per tube helps you get the power you need out of a small rig . . . and at a budget receiving-tube price. Also, here is a tube specially designed and built to perform, to last—one of General Electric's famous Service-Designed types, which TV technicians coast-to-coast are installing in critical sockets.

Your local G-E tube distributor has the new Service-Designed 6BG6-GA. See him today! *Tube Department, General Electric Company, Schenectady 5, New York.*

The enemy attack will allow *no time* for the development of advanced communications systems... *no time* to further perfect electronic equipment for defense or swift retaliation... *no time* to produce more of the vital and dependable equipment made by Hallicrafters during World War II and Korea. Hallicrafters, with a background of over twenty years of electronic "know how," is perfecting and producing secret equipment *now* being used by our Air Force and other branches of the service. The American "edge" over the enemy depends upon Hallicrafters and other "Primary Producers" for the United States Armed Forces.

*World's leading exclusive manufacturers  
of communications radio*

## Section Communications Managers of the ARRL Communications Department

**Reports Invited.** All amateurs, especially League members, are invited to report station activities on the first of each month (for preceding month) direct to the SCM, the administrative ARRL official elected by members in each Section. Radio club reports are also desired by SCMs for inclusion in QST. **ARRL Field Organization station appointments** are available in the areas shown to qualified League members. These include ORS, OES, OPS, OO and OBS. SCMs also desire applications for SEC, EC, RM and PAM where vacancies exist. All *amateurs* in the United States and Canada are invited to join the Amateur Radio Emergency Corps (ask for Form 7).

SIDEBAND RECEIVER**

**hallicrafters**

Chicago 24, Illinois

In Canada:

THE HALLCRAFTERS COMPANY • Don Mills Road • Box 27, Station R • Toronto 17, Ontario, Canada

## **HALLCRAFTERS**

- Covers Broadcast 538-1580 kc plus three S/W 1720 kc—34 Mc.
- Precision gear drive dial system.
- Double conversion with selectable crystal controlled second oscillators
- Selectable side band reception of both suppressed carrier and full carrier transmissions.
- Highly selective 50 kc I. F. system.
- CW operation with AVC on.
- Delayed AVC.
- Calibrated bandspread—"S" meter—double superhet.
- 10 tubes, 1 rectifier and voltage regulator.

# THE AMERICAN RADIO RELAY LEAGUE, INC.,

is a noncommercial association of radio amateurs, bonded for the promotion of interest in amateur radio communication and experimentation, for the relaying of messages by radio, for the advancement of the radio art and of the public welfare, for the representation of the radio amateur in legislative matters, and for the maintenance of fraternalism and a high standard of conduct.

It is an incorporated association without capital stock, chartered under the laws of Connecticut. Its affairs are governed by a Board of Directors, elected every two years by the general membership. The officers are elected or appointed by the Directors. The League is noncommercial and no one commercially engaged in the manufacture, sale or rental of radio apparatus is eligible to membership on its board.

"Of, by and for the amateur," it numbers within its ranks practically every worth-while amateur in the nation and has a history of glorious achievement as the standard-bearer in amateur affairs.

Inquiries regarding membership are solicited. A bona fide interest in amateur radio is the only essential qualification; ownership of a transmitting station and knowledge of the code are not prerequisite, although full voting membership is granted only to licensed amateurs.

All general correspondence should be addressed to the administrative headquarters at West Hartford, Connecticut.

## Past Presidents

HIRAM PERCY MAXIM, W1AW, 1914-1936  
EUGENE C. WOODRUFF, W8CAP, 1936-1940

# "It Seems to Us..."

## FIELD DAY

One Saturday in mid-June of last year, from their homes in Canada, the U. S. and possessions, eight thousand three hundred and eighty persons,<sup>1</sup> who otherwise appeared perfectly normal, disappeared into woodlands, mountains and open fields carrying a little food and clothing and a lot of radio apparatus. There they set up two thousand and twenty-six<sup>1</sup> separate transmitter-receiver combinations operating independently of commercial power mains and for a solid twenty-four hours of the ARRL Field Day had themselves a time etching the Kennelly-Heaviside layer indelibly with "CQ FD."

The simple process of subtraction indicates that there were 114,907 holders of amateur licenses who did not take part in Field Day fun. We think they made a great mistake as any participant in the 1954 event will confirm. But it is a mistake which can easily be corrected — the opportunity will come again this June, on the 25th-26th. And with balmy days here again for most of us, now is the time. . . .

. . . Time to find out if Old Man Smith's apple orchard will again be available for an operating site. We've got to try out the generator, to make sure the needle valve isn't gummed up again, and that the gas line isn't about to expire from old age. The tent will have more leaks than last year, but we'll try the paraffin again and keep our fingers crossed. We take our local public relations seriously, but that new reporter on the *Daily Blast* may not think a night on a canvas cot contributes anything to the public knowledge. Shall we use an antenna changeover relay this year, or just toss a wire out the window for receiving? We've got to decide whether we'll have a multi-station set-up so everyone can operate Sunday afternoon, or stick to one station and keep it busy all night. Bill Jones' XYL will say she doesn't think she wants to provide the grub this year, and then change her mind, as she always does, and put on a magnificent spread. . . .

So we'd better devote the next meeting to Field Day. And you'd better, too. First thing you know it will be time to put up the antennas, and then you'll suddenly remember

that one of the masts got broken when somebody let go of a guy wire last year. And that table leg needs fixing again. So, you see, if you don't get busy you're liable to miss all the fun — and have only yourself to blame.

We think FD is the top event of the amateur year. Where else, in one week end, can you combine the good-fellowship of a hamfest, the underlying motive of preparation for public service, the fresh air and fun of a picnic, the teamwork of coöperative effort, and the excitement of an operating contest? If you haven't tried it before, make it *this* year. BCNU/1!

## MOBILE SAFETY

For some time now we've been on the verge of reminding amateurs of the importance of careful driving during mobile operations, a responsibility accentuated by the growing number of states which issue call-letter license plates. "Lighthouse Larry" in *G-E Ham News* last summer stated the case so nicely, however, that we can't do better than commend to your serious attention the following excerpts from his editorial:

. . . The license plate program has met with considerable success throughout the nation — and has given us a great boost in publicity. In many cases we are thus put on a level with doctors and other public servants.

However, as we attain this stature we also have to remember that it behooves us to live up to our new standing — by added care and courtesy on the road. Need more be said than to comment that every traffic ticket a ham with call-letter license plates gets is a black eye for ham radio? And suppose through our carelessness it should be something worse than just a "ticket"? Suppose it's a broken, twisted body of a child on the highway? We see such pictures in the newspaper once in a while. And I fervently hope I never see one which includes a "murder car" bearing ham call-letter license plates.

You think this is a painful and unpleasant subject? Sure is, but not half as painful and unpleasant as the real thing. We bring it up in the hopes that a few thoughts now, beforehand, may prevent the real thing from ever happening.

<sup>1</sup> And probably many more not reported to Hq.

## A.R.R.L. PACIFIC DIVISION CONVENTION

**Fresno, Calif. — May 21-22, 1955**

The 1955 ARRL Pacific Division Convention will be held in Fresno, Calif., on Saturday, May 21st, and Sunday, May 22nd, and will be sponsored by the Fresno Amateur Radio Club, Inc. There will be two days of excellent entertainment consisting of a variety comedy program, many outside activities, electronic exhibits, technical discussions, and mobile hunts, mobile judging, and ladies' luncheon and activities, topped off with a barbecued steak banquet. The price for each ticket is \$6.75. For further details address inquiries to: 1955 ARRL Pacific Division Convention, % Grant Storey, W6NTK, 908 West Pico St., Fresno 5, Calif. Preregistration ends May 16th, 12:01 A.M. If you desire to register early, make out your checks to the Fresno Amateur Radio Club, Inc.

### COMING A.R.R.L. CONVENTIONS

May 7th-8th — Oregon State, Portland, Ore.  
May 21st-22nd — Pacific Division, Fresno, Calif.  
June 10th-12th — West Gulf Division, Fort Worth, Texas  
June 11th-12th — North Dakota State, Bismarek, N. D.  
June 11th-12th — Southeastern Division, St. Petersburg, Fla.  
July 30th-31st — Canadian Division, St. John, New Brunswick  
August 12th-14th — Roanoke Division, Old Point, Va.  
October 15th-16th — Central Division, South Bend, Ind.  
October 22nd-23rd — Midwest Division, Omaha, Neb.

## Strays

"2 Meter Men Held in Thefts" was a headline recently appearing in *The Evening Bulletin*, a Philadelphia newspaper. Further reading revealed that they were not v.h.f. men, but parking-meter collectors! — W3YKT

During his first few weeks on the air, KN2SSP worked Huntington Woods, Mich., Huntington, L. I., N. Y., and Huntington Station, N. Y.

When the Hartford County Amateur Radio Association scheduled W0EDX as guest speaker at one of their get-togethers, the meeting notices to members read "Al Pichitino, WEDX, Chief Engineer of the E. F. Johnson Company. . . ." Calling the mailing service to complain about the error, HCARA prexy, W1ULY, got the following indignant reply: "You had a zero in there, but it was crossed out!"

In Portland, Ore., Sharon La Baugh, a youngster stricken with leukemia, asked if she might have a watermelon. None being available in that city, her wish was brought to the attention of Portland amateurs who originated an emergency request for a melon. After much relaying, in which many hams participated, the plea was received at Miami, Fla. From there, two melons were sent by air to the afflicted child.

W8NSX heard W9NSX in contact with W9PCY. Breaking in, W8NSX was followed by none other than W8PCY. This shrinking world!

### OUR COVER

Sweepstaker Dick Baldwin, W1IKE, is shown tuning the transmitter he describes in "Easy Shielding for Ninety Watts." The article begins on page 25 of this issue. (Photo by W1UPX)

**May 1930**

. . . New records set . . . all continents active . . . excellent reception . . . foreign stations craving more U. S. activity! These are the highlights of "International Communications on 28 Mc.," by Clark C. Rodimon, W1SZ.

. . . QST announces the appointment of George Grammer, W1DF, as Assistant Technical Editor. Mr. Grammer, formerly W3AIH of Audubon, N. J., joined the Headquarters staff last fall to take charge of the ARRL Technical Information Service.

. . . Pioneering in the field of air-to-ground communications is still continuing with recent 'phone experiments. A summary of the latest is presented by C. H. Vincent, W8XB-W8RD, in "Airplane Radiophone Communications Experiments."

. . . In keeping with Mother's Day, the "Old Man" pays a fine tribute to moms (especially those of hams!).

. . . W4GV is described as a station featuring effectiveness, convenience, and low cost. Operator Cornelius W. Zimmerman pounds the ether with two transmitters putting out healthy signals on 7 and 14 Mc. The receiver is a simple, but nevertheless effective, two-stage "blooper."

. . . In "Our Regulations Are Revised," K. B. Warner tells of latest FCC changes in amateur regulations. Among them are the solidification of the amateur's position, better plate supplies required, the 10-meter band made exclusively amateur, and compulsory logkeeping.

. . . A light, compact, and completely shielded "inhaler" that covers a wide frequency range as well as being self-contained is described by Howard A. Chinn in "An All-Service Portable Receiver."

. . . "ARRL Coöperates with the 'Aretic Patrol' in Mid-winter Maneuvers," by F. E. Handy, gives a vivid description of the role played by amateur radio in assisting the Army Air Force.

. . . "The All-Section Sweepstakes Contest," by E. L. Battey, recounts the results of this highly successful "race." Top honors go to W1ADW who tallied 13,158!

. . . A new system of uniform tube designation is being adopted by QST. Under the new plan, a UX-210 becomes Type '10, a DeForest 422 becomes Type '22, etc.

# The "Z-Match" Antenna Coupler

*Impedance Matching the Easy Way*

BY ALLEN W. KING,\* W1CJL

"WHEN it takes more time to make frequency changes in an antenna-coupler circuit than it does in a 500-watt rig, it's high time something should be done about it." The quotation is from a 1954 *QST* that appeared at just about the time the "Z-match" was finished and in operation. Having been a user

• This comes close to being the ultimate in multiband antenna couplers, from the standpoint of convenience and ease of operation. Using a multiband tank in an ingenious circuit arrangement, it offers switchless 3.5–30-Mc. operation plus quick and certain adjustment to optimum coupling by means of a built-in bridge.

Panel view of the "Z-match" antenna coupler. Incorporating a built-in bridge for forward and reflected power and a dummy antenna, it uses a multiband tank in a new circuit arrangement for matching the usual run of transmission-line loads to a coaxial link.

of all-band tank circuits for the past few years, the writer had decided to attempt to use one in reverse, and some interesting results were obtained.

The "Z-match" antenna coupler is designed for use with transmitters having up to 250 watts input, and will match a 50-ohm coaxial line to both reactive and nonreactive loads ranging from

\*Project Engineer, Harvey-Wells Electronics, Inc., Southbridge, Mass.

The multiband tank circuit consists of the split-stator capacitor at the left and the two inductors, with links, in the center. Coupling is controlled by the tank and the capacitor at the right. The two-terminal assemblies connect to the two link coils.

following the layout of the unit, especially the forward- and reflected-power indicating device.

### Construction

The "Z-match" shown in the photographs is built on an  $11\frac{3}{4} \times 9\frac{1}{4} \times 2\frac{1}{2}$ -inch chassis, and the panel is  $12\frac{1}{4}$  by  $6\frac{3}{4}$  inches. These were used because they were on hand, but any number of commercially-available chassis and dust-cover combinations could be used with good results.

The chassis itself is used to separate the low-impedance input circuits from the comparatively high-Z output circuits, and no matter what size chassis is used this constructional practice should be followed. The coupling capacitor  $C_{10}$  is electrically above ground and is mounted on two feed-through insulators (Johnson type 135-55), one of which is used to bring the electrical connection through the chassis to the rotor of  $C_{10}$ . This capacitor is set back from the panel and coupled to the dial by an insulated shaft, thus eliminating body capacity.  $C_{11}$  is mounted at the other end of the chassis and the control is brought out through the panel with symmetry in mind. Inductors  $L_2$  and  $L_4$  are mounted near the rear output terminal panel, mainly because this is the high-frequency section (14 to 30 Mc.) and over-all lead length should be kept to a minimum. Coils  $L_1$  and  $L_3$  are mounted at right

angles to  $L_2$  and  $L_4$  to reduce mutual coupling.

The output terminal panel on the rear of the chassis has two National type FWH connectors and a wing-nutted ground terminal, allowing the operator to connect either balanced or unbalanced antennas. The two output terminals (high and low frequency) could very well be one, if an antenna changeover relay was used, although separate connectors are convenient when separate antennas are used.

The two rotary switches  $S_1$  and  $S_2$  are placed in a position to maintain panel symmetry, and also to keep lead lengths to a minimum for the connections to  $S_2$ . As can be seen from the photographs, the 50-ohm dummy load is mounted on standard fuse clips and the "hot" end is kept as close to the ceramic switch  $S_2$  as possible. The dummy load has been insulated from the chassis at the hot end by a  $\frac{1}{4}$ -inch-thick phenolic block; however, the same feed-through that was used on  $C_{10}$  could be used instead. The grounded end is raised up from the chassis merely in keeping with good constructional practice. This can be done with a metal spacer having the same height as either the phenolic block or the feed-through type insulator, whichever is used.

The rear-view photograph shows the output terminals marked as "parallel" and "series." These, however, could be called "low-frequency"

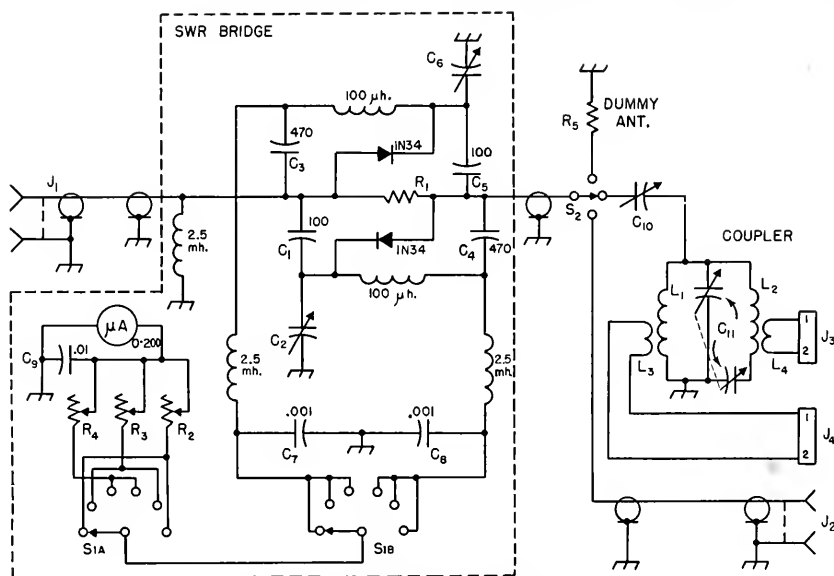

Fig. 1 — Circuit diagram of the "Z-match."

- $C_1, C_5$  — Erie button type or equivalent.
- $C_2, C_6$  — Tubular-type variable, 0.5–5  $\mu\text{mf}$ . (Erie type 532-08).
- $C_3, C_4$  — Mica or ceramic.
- $C_7, C_8, C_9$  — Disk ceramic.
- $C_{10}$  — 340- $\mu\text{mf}$ . variable (Bud 1529).
- $C_{11}$  — 250- $\mu\text{mf}$ . per-section variable (Bud 1556).
- $R_1$  — 0.625 ohm, 8 watts (sixteen 10-ohm  $\frac{1}{2}$ -watt composition resistors in parallel).
- $R_2$  — 2500-ohm carbon potentiometer.
- $R_3$  — 25,000-ohm carbon potentiometer.
- $R_4$  — 50,000-ohm carbon potentiometer.
- $R_5$  — 50 ohms, 50 watts (GE Globar type CX).
- $L_1$  — 3.4  $\mu\text{h}$ .; 7 $\frac{3}{4}$  turns No. 14, 2 1/16-inch diam.,

- 1 $\frac{1}{4}$  inches long.
- $L_2$  — 1.7  $\mu\text{h}$ .; 5 $\frac{1}{2}$  turns No. 14, 2 1/16-inch diam., 1 $\frac{3}{4}$  inches long.
- $L_3$  — 2.35  $\mu\text{h}$ .; 6 $\frac{1}{2}$  turns No. 14, 2 $\frac{5}{8}$ -inch diam.,  $\frac{5}{8}$  inch long.
- $L_4$  — 1.8  $\mu\text{h}$ .; 4 $\frac{3}{4}$  turns No. 14, 2 $\frac{5}{8}$ -inch diam.,  $\frac{1}{2}$  inch long.
- $J_1, J_2$  — Coaxial connectors.
- $J_3, J_4$  — Binding-post assemblies (National type FWH).
- $S_1$  — Rotary switch, 2 poles, 6 positions (bakelite wafer).
- $S_2$  — Rotary switch, 1 pole, 3 positions, shorting (ceramic wafer).

The bridge assembly. The circuit arrangement is made symmetrical for the purpose of reducing the effects of stray capacitance and inductance. The resistors in the center ( $R_1$ ) are assembled in the form of a cylinder supported by soldering their leads to circular pieces of wire. This reduces inductance and tends to assure uniform current distribution throughout the assembly.

and "high-frequency" outputs. The thought in marking them "parallel" and "series" was that the low-frequency tank coil is parallel connected, while the high-frequency tank coil is the series circuit.

#### *S.W.R. Bridge*

The s.w.r. bridge consists of two bridges connected back to back so that incident and reflected power may be determined. The theory and operation have been ably presented elsewhere and will not be dealt with here.<sup>1</sup>

The incident-power bridge consists of  $R_1$ ,  $C_5$ ,  $C_6$  and the transmitter output impedance; the reflected-power bridge consists of  $R_1$ ,  $C_1$ ,  $C_2$  and the load. The output of the bridge is rectified by

<sup>1</sup> Jones and Sontheimer, "The Micromatch," *QST*, April, 1947. See, also, "Recent Equipment," p. 43, *QST*, March, 1955.

Switches, input circuit, bridge and dummy antenna are below chassis. The three variable resistors at the upper left in this view are adjusted for proper power calibration of the bridge and thereafter left set. The Global resistor used as a dummy antenna is along the right-hand edge.

the crystal diodes. A d.c. path is provided by the r.f. choke. The rest of the components are used for r.f. filtering.

$R_1$  consists of sixteen 10-ohm  $\frac{1}{2}$ -watt composition resistors in parallel. Since the bridge is designed to operate from 3 to 30 Mc., it is important that noninductive resistors be used. For best results,  $C_1$  and  $C_5$  should be of the button type. They proved to be decidedly better than silver micas. Needless to say, all lead lengths should be kept as short as possible to reduce the effects of lead inductance. The layout shown in the photograph should be followed, and since this shows the placement of parts quite clearly, constructional details will be omitted.

In the initial set-up of the bridge, set  $S_2$  to the dummy load position, apply r.f. power to the input terminal, and adjust  $C_2$  for zero deflection. Next, temporarily reverse the bridge and adjust  $C_6$  for zero deflection. Then return to the original input-output connections and the bridge is ready for calibration. A good calibration will require comparison with an already-calibrated power meter, or by calculation from the r.f. current in the dummy load as measured by an r.f. ammeter connected in series with the load. The full-scale power values (three ranges are provided for) may be set by adjusting  $R_2$ ,  $R_3$  and  $R_4$ . However, an actual power calibration is not at all necessary to the operation of the "Z-match," since the bridge will serve quite well both for adjustment of coupling and for relative power indications without calibration.

The meter used in the bridge has a basic movement of 0-200 microamperes, and in this case a hand-calibrated scale was made by taking the original meter plate off and reversing it. The three scales were then hand-painted on, as the photograph shows.

#### *Operation*

The bridge provides a visual way of adjusting the coupler, while the 50-ohm noninductive load

# Automatic Mobile Antenna Tuning

## *A Self-Resonating System for 40 and 75*

BY JOHN A. HARGRAVE,\* WØIGP

It is obvious that mobile operation of the amateur station has increased many times during the past several years. While the 10-, 15- and 20-meter bands offer a general efficiency and convenience of operation from a mobile station comparable to that of the home station, 40 and 75 meters present a more difficult problem. This may be attributed primarily both to practical power limitations and poor radiation-system efficiencies. It has been generally proven that, except for increased physical length, the greatest single factor contributing to the efficiency of a loaded antenna system is loading-inductor efficiency or  $Q$ . The greater the r.f. resistance of a given loading inductance, the greater will be the r.f. loss resulting from its operation. It becomes apparent that for a practical figure of efficiency, maximum practical loading-inductor  $Q$  must be maintained, and general transmitter and coupling efficiency must be kept at a reasonably high figure.

The expression "high  $Q$ " is a relative quantity and strictly dependent on the peculiar interpretation of the user. High  $Q$  is generally synonymous with the presence of a sharply resonant circuit with a narrow bandpass characteristic. Generally speaking, a high- $Q$  5- to 8-foot mobile whip antenna, loaded for the 75-meter band, will be sharply resonant, and will begin to appear seriously reactive at a deviation from the carrier frequency of about 5 ke. Any effort to broaden the response by loading-inductor construction will, in the majority of cases, be merely a compromise

\* R.F.D. 1, New Sharon, Iowa.

• Most mobile operators, especially those working 40 and 75, understand the inconvenience of having to stop and re-tune the antenna for every few kilocycles changes in frequency. The system described here does away with all this by automatically reresonating the antenna whenever frequency is shifted. It also compensates automatically for detuning caused by antenna lay-back, or opening the trunk.

in efficiency and a most dear one. Much has been written concerning high-efficiency loading inductors, and any basic theories conscientiously applied will in all probability result in an appreciable increase in  $Q$  and radiation efficiency.

An increasingly large number of the mobile transmitters being built are for multiband and VFO operation. The majority of these are being mounted beneath the automobile instrument dash, within easy reach of the driver-operator. Mobile VFO seems like a marvelous convenience until it is realized that the carefully designed antenna system is restricted to a bandwidth of a few kilocycles. It is mechanically practical to provide an adjustable whip length or to afford a manually adjustable inductor to enable multi-frequency operation, although their location by necessity must be remote from that of the under-dash-mounted VFO transmitter.

WØIGP's under-dash mobile installation. The automatic antenna-tuner control box is at the right. The shafts of the two potentiometers extend from the bottom.

Within this article is described a system for use over the 40- and 75-meter bands providing automatic adjustment of antenna resonance in response to the output frequency of the mobile transmitter. It permits maximum use of VFO control and convenient use of maximum- $Q$  antenna systems. This system was installed in the author's 1953 Buick and has proven very successful and a great convenience. The present mobile transmitter runs 40 watts input, but the system has been used successfully with input powers of from 15 to 300 watts. Although the system was designed for mobile operation, it has been used experimentally on a fixed-station vertical and has proven very satisfactory.

### Circuits and Theory

This system<sup>1</sup> consists of a device for detecting antenna resonance, and provides control of a reversible motor which is coupled to a variable antenna-tuning inductance located at the base of the antenna. An inductive load, as observed by the detector, will cause the motor to rotate in one direction, while a capacitive load will cause it to operate in the other direction, such rotation reestablishing antenna resonance.

It is generally understood that an r.f. transmission line terminated in a pure resistance equal to its characteristic impedance will be flat. This means that there will be no reflections from the loaded end of the line, and that at any point along that line the voltage and current will be in phase. A high- $Q$  antenna may be matched to a given type of transmission line but, should the resonant frequency of the load shift to a slightly higher or lower frequency, or should the exciting frequency change to a lower or higher frequency, the antenna system will no longer present a purely resistive load to the transmission line and a complex load will reflect a standing wave back along the transmission line. Under such a condition a shift in voltage/current phase and amplitude relationship will result. These factors produce an increase in load impedance and a significant drop in transmitter loading. The detecting system operates as a result of these variables reestablishing a resistive termination.

The phase detector used in this system is quite similar to the Foster-Seeley f.m. discriminator. Operation of the conventional discriminator results from the phase relationships existing in a transformer having a tuned primary and secondary, both capacitively and inductively coupled. The phase detector shown here in Fig. 1 operates from a low- $Q$  impedance, both capacitively and inductively coupled to the r.f. antenna transmission line. This impedance, represented by  $L_2$  and its distributed circuit capacitances, provides sufficient impedance for satisfactory circuit operation and avoids the inconvenience of a tuned tank. As was previously stated, providing a proper match exists between the r.f. load and its trans-

mission line, r.f. current and voltage on such a line will be in phase. The voltage on the line is used as a reference, and a small amount of this voltage is coupled into the detector circuit through the distributed capacitance existing between  $L_1$  and  $L_2$ . The relative amount of this

Fig. 1 — Phase-detector circuit used to produce control voltage for the automatic mobile-antenna resonator.

- $E_1$  — Voltage across transmission line.
- $E_2$  — Portion of  $E_1$  determined by the voltage-divider ratio of  $C_1$  and distributed capacitance,  $C_x$ .
- $E_3, E_4$  — Voltage induced by  $L_1$ - $L_2$  mutual.
- $E_{2-3}, E_{2-4}$  — Vector sums of applied voltages,  $L_2$  is self-resonant at a frequency considerably above normal frequencies of operation,  $L_1$  is a  $3/4$ -turn link in series with the antenna and transmission line,  $C_2$  and  $C_3$  provide very low impedance to r.f. currents.

voltage applied to the detector circuit is determined by the capacitive voltage-divider ratio of the distributed capacitance between  $L_1$  and  $L_2$ ,  $C_x$ , and the value of capacitor  $C_1$ . A second voltage, necessary to provide a medium of phase comparison, is introduced as a result of line current flowing through  $L_1$ . Such a current will create a magnetic field about  $L_1$  and, because of mutual inductance, will produce a current and resultant voltage in the secondary coil  $L_2$ . The resulting voltage across  $L_2$  will lag the inducing current through  $L_1$  by 90 degrees.

The two voltages described above appear in series between the plate of each diode and the center tap of  $R_1$ . Voltages  $E_3$  and  $E_4$  are separated in phase by 180 degrees, with reference to the center tap of  $L_2$ , and are in quadrature with voltage  $E_2$  when a condition of resonance is observed on the transmission line under examination. Under these conditions the effective voltage on the plate of each diode will be of similar amplitude, and will produce a rectified voltage of equal and opposite sign across each half of the load resistor  $R_1$ . The resultant sum of zero volts across  $R_1$  indicates a resonant and balanced condition, as indicated in Fig. 2A.

Fig. 2 — Voltage vector relationships for conditions (A) — when the antenna is resonant, (B) — when the antenna is above resonance, and (C) — when the antenna is below resonance. Voltages refer to Fig. 1.

<sup>1</sup> Knoop, "Automatic Tuning of the Antenna Coupler," August, 1952, *QST*; Mezger, "A Phase-Angle Detector for R. F. Transmission Lines," July, 1952, *QST*.

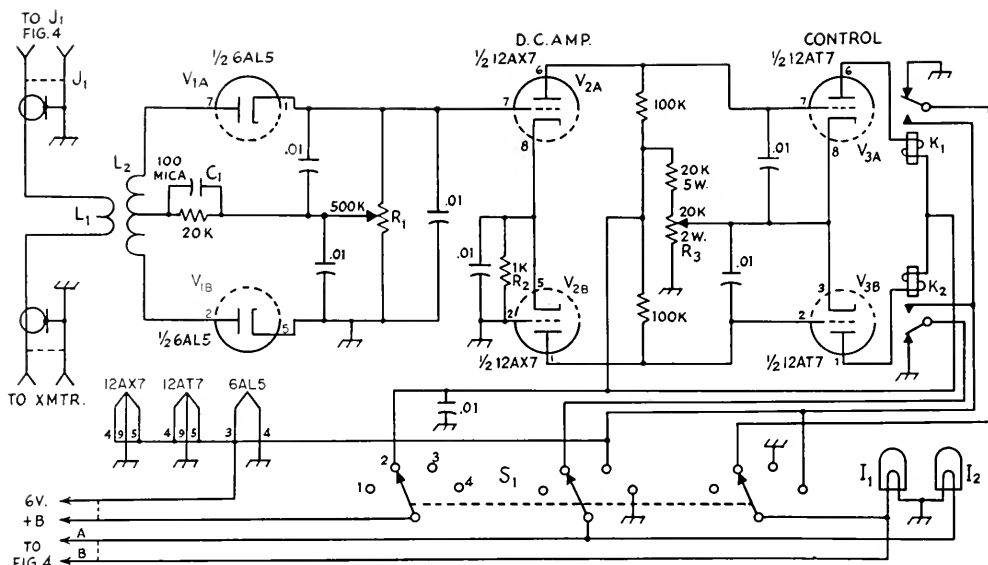

Fig. 3 — Circuit of the automatic mobile antenna tuner.

C<sub>1</sub> — Mica; all other capacitors are disk ceramic.

R<sub>1</sub> — IRC type Q.

R<sub>3</sub> — Ohmite type AB.

R<sub>4</sub> — Wire-wound.

All other resistors 10 per cent carbon,  $\frac{1}{2}$  watt, unless otherwise specified.

L<sub>1</sub> — Approx.  $\frac{3}{4}$  turn No. 16 wire, over center of L<sub>2</sub>.

L<sub>2</sub> — 20 turns No. 18 enameled wire close-wound, center-tapped on  $\frac{3}{8}$ -inch bakelite rod.

I<sub>1</sub>, I<sub>2</sub> — Green and amber  $\frac{1}{2}$ -inch indicator lamps.

K<sub>1</sub>, K<sub>2</sub> — S.p.d.t. plate-circuit relay, 10,000 ohms (Potter-Brumfield LB5).

S<sub>1</sub> — 3-pole 4-position rotary switch (Mallory 3234-J).

In the event of antenna detuning or a change in transmitter frequency, a change in the current and voltage phase relationship along the transmission line will result, and a balanced output from V<sub>1A</sub> and V<sub>1B</sub> will no longer exist. It may again be said that the reference voltage introduced by the capacitive coupling is in phase with the voltage along the line, but there is no longer a 90-degree phase relationship between this voltage and that developed across L<sub>2</sub> as a result of line current through L<sub>1</sub> and L<sub>1</sub>-L<sub>2</sub> mutual inductance. Under such conditions, phase relationships similar to the vectors indicated in Figs. 2B and 2C will result. From this it may be seen that a phase shift in one direction, as a result of a change in the exciting frequency, or a change in the frequency of antenna resonance, will cause the detector to produce a negative output voltage, while the opposite change in frequency or antenna resonance will cause the detector to produce a positive output voltage. Potentiometer R<sub>1</sub> is a balancing control, the proper adjustment of which will overcome circuit unbalances and will provide balanced output.

The complete control circuit is shown in Fig. 3. The 6AL5 phase detector provides a d.c. output voltage of either positive or negative polarity dependent upon the resonant frequency of the antenna system in reference to the transmitter operating frequency. This output voltage is applied to the grid of a d.c. amplifier, V<sub>2A</sub>, Fig. 3. V<sub>2A</sub> is cathode-coupled, by way of cathode resistor R<sub>2</sub>, to V<sub>2B</sub>, and the plate circuits of both sections of V<sub>2</sub> are directly coupled to the grids of

the control tube, V<sub>3</sub>. In order to provide d.c. voltage amplification, direct interstage coupling is necessary. This arrangement places the entire plate potential of V<sub>2A</sub> and V<sub>2B</sub> on the respective control grids of V<sub>3</sub>. Under conditions of antenna resonance, the phase detector provides approximately zero volts output, and sensitivity control R<sub>3</sub> is adjusted to the point where the static plate current of V<sub>3A</sub> and V<sub>3B</sub> will not hold relays K<sub>1</sub> and K<sub>2</sub> in the energized position. This adjustment places the cathodes of V<sub>3</sub> at a more positive potential than their respective control grids, this bias being of such magnitude as to approach plate-current cut-off.

Following adjustments of balance and sensitivity, any slight change in phase detector output will cause either K<sub>1</sub> or K<sub>2</sub> to operate, causing the tuning motor to rotate in one direction or the other.

### Matching Antenna to Line

It is necessary that the transmission line from the transmitter to the loaded antenna be made relatively flat if smooth indication and operation is desired from one band edge to the other. This may sound like a difficult task, but the adjustment may be made with very little equipment or effort. It essentially requires that the loaded antenna at resonance present the same load to the transmission line as a noninductive resistor equal in resistance to the characteristic impedance of the transmission line. Providing no more than 20 watts of power is made available at the base of the loaded whip, ten 500-ohm 2-watt

carbon resistors may be placed in parallel to act as a dummy load for RG-8/U cable. The impedance-matching system utilized with this antenna consists of a plug-in coil,  $L_2$ , Fig. 4, mounted on the remote tuning unit, and connected from the input side of the variable loading inductor,  $L_1$ , to the automobile body. A satisfactory adjustment may be made by establishing normal transmitter loading with the dummy load, then switching to the antenna system and, while maintaining antenna resonance, adjusting the matching inductance for identical load conditions. It will be found that a difference of as much as one quarter turn will have considerable effect on loading and the proper impedance match. A 6-turn coil  $1\frac{1}{2}$  inches in diameter, 2 inches long, was found satisfactory for this particular installation when operating in the 75-meter band. The circuit for the remote tuning unit is shown in Fig. 4 and a photograph of the unit is also included.

### General Design

This system contains two basic units:

- 1) The control unit consisting of a  $4 \times 4 \times 2$ -inch box mounted beneath the instrument dash, and containing all detecting and control circuits and components other than the motor, the motor-reversing relay and the impedance-matching and variable inductors. All components associated with the control unit are mounted within the box with the exception of the three vacuum tubes. These are mounted on the rear lip of the unit to afford adequate circulation of air.
- 2) The remote tuning unit is located in the automobile trunk, adjacent to the base of the loaded whip. It contains the variable series in-

Motor-driven antenna-tuning unit. The plug-in inductor is the matching inductor shown in Fig. 4. This unit is placed in the trunk of the car, as close to the base of the antenna as possible.

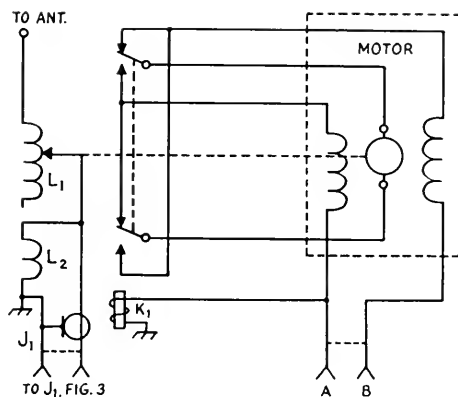

Fig. 4 — Wiring diagram of the motor-driven tuning section.  $L_1$  is the variable portion of the whip loading coil. A variable inductor from a military Command transmitter is used.  $L_2$  is a matching inductor.  $K_1$  is a 6-volt d.c. d.p.d.t. relay (Guardian 200-5). The motor is a 6-volt defroster motor. The antenna terminal should be connected to the base of the whip with the shortest possible lead.  $L_2$  should have a solid connection to the frame of the car. See text for further details.

ductor, impedance-matching inductor, tuning motor and motor-reversing relay.

The front panel of the control unit contains a three-pole four-position rotary switch,  $S_1$ , Fig. 3, and two pilot-light assemblies,  $I_1$  and  $I_2$ . The switch selects the mode of operation, and the two pilot lights indicate the resonant condition of the antenna. When the right-hand lamp,  $I_2$ , is lighted, it indicates an inductive antenna, and when the left-hand lamp,  $I_1$ , is lighted, a capacitive antenna is indicated. Providing the system is properly adjusted, a resistive antenna will be

The control unit is assembled in a  $4 \times 1 \times 2$ -inch box. The tubes are mounted at the rear, the antenna and transmitter coax connectors on the side, and the switch and indicator lamps on the front.

indicated by both lamps being extinguished.

The three-pole four-position switch utilizes the four positions as follows: (1) off, (2) automatic tuning, (3) manual increase inductance, and (4) manual decrease inductance. During normal operation, the switch will be left in Position 2 except on 10, 15, and 20 meters, where the antenna bandwidth is sufficiently broad that automatic tuning is not necessary. In this case, the switch may be left in the off position. When QSYing from one end of a band to the other, it is not necessary to keep the transmitter on the air while waiting for the antenna to be tuned to resonance. While on automatic position the VFO may be adjusted to the desired frequency, the transmitter output tank adjusted to resonance and note made whether the antenna is inductive or capacitive as indicated by the two pilot lights. The transmitter may then be taken off the air and the control switch placed in one of the two manual positions for an approximate adjustment of the series inductance. The switch may then be returned to the automatic position for an exact antenna adjustment.

### Construction

Inductor  $L_2$ , Fig. 3, consists of 20 turns of No. 18 enameled wire close-wound and center-tapped on a  $\frac{3}{8}$ -inch bakelite rod.  $L_1$  is formed of No. 16 wire and consists of a  $\frac{3}{4}$ -turn loop about  $L_2$ . This provides an optimum value of coupling for 25–50-watt transmitters. Although the coupling between  $L_1$  and  $L_2$  is not critical, it should be reduced as higher transmitter power is employed. A slight change of coupling may be found necessary with different installations.

To facilitate construction procedures, the control unit was assembled and wired with both  $4 \times 4$ -inch covers removed. This simplifies the task of assembling and wiring considerably. As an aid to simplification it is recommended that wires be cabled together where practical, even though it may require greater lead length. Where no

critical circuits are involved, cabling will greatly limit the congestion which is unavoidable with a unit of this size. Of course, the leads to  $L_1$  and  $L_2$  should be kept short and direct.

The tuning motor was originally an automobile defroster motor purchased at a used auto-supply store for \$1.00. It was disassembled and leads brought out for connection to the d.p.d.t. reversing relay. Six- and 12-volt d.c. motors may be wired in a number of ways. Frequently, the armature is connected between the two fields, and the combination placed in series across the automobile battery. In this case the most simple way to provide a reversal of rotation is by reversing the armature connections in respect to the field windings. In other cases a field reversal may be more simply accomplished.

The gear reduction unit was taken from a PE-101 dynamotor where it was originally used to operate an automatic keyer. The variable inductor,  $L_1$ , Fig. 4, was taken from a military Command transmitter. All other components are of standard manufacture and readily available at most radio supply houses. A simple replacement for the entire antenna tuning unit would be a motor-driven variable inductor which is available commercially.

Power for the automatic mobile tuner is taken directly from the mobile transmitter. The filaments are not switched on or off within the unit itself, but are taken directly from the transmitter filament switch. The unit requires 0.9 amp. at 6 volts and 200–400 volts at approximately 15 ma. Satisfactory sensitivity may be realized with voltages as low as 200, although an increase in  $L_1$ - $L_2$  coupling may be found necessary. Voltages over 400 should be avoided because of possible cathode-to-heater break-down in  $V_3$ .

### Adjustment

Provided the antenna system has been properly matched to the transmission line in use, the

(Continued on page 118)

# Vertical Multiband Antennas

## Two Practical Systems with Coax Feed

BY L. L. TAYLOR,\* W8LVK

• The radiation angle from a vertical antenna will be satisfactory for long-distance work over about a 3-to-1 frequency range if the proper antenna length is used. This article offers a solution to the more difficult problem of feeding such an antenna with coax, without excessive loss in the feeder.

ALTHOUGH there is no simple multiband antenna that provides optimum performance with respect to matching a transmission line, systems can be devised which are compromises and can be made to perform fairly well on several bands. This article describes two such vertical antennas, one of which performs quite well on the 10-, 11-, 15-, and 20-meter bands, the other on the 15-, 20-, and 40-meter bands.

It is pointed out in *The ARRL Antenna Book*<sup>1</sup> that vertical antennas do not make satisfactory

Fig. 1—Vertical-plane field patterns of vertical antennas for several values of antenna height. The field intensity is expressed in millivolts per meter at a distance of one mile for one kilowatt input. Perfectly conducting ground and zero loss resistance are assumed. From Kraus.<sup>2</sup>

multiband antennas because their angle of radiation increases with frequency. This is true except for the region where the vertical antenna is less than 0.64 wavelength long. Between 0.2 and 0.64 wavelength long the radiation angle decreases as frequency increases. This is shown in Fig. 1, which is a field-intensity plot in the vertical plane of a vertical antenna for three different frequencies. These curves assume zero loss resistance in the antenna and a perfectly conducting ground plane. The actual value of resistive loss in the antenna will merely shrink

Fig. 2—Input resistance vs. length in wavelengths for vertical antennas of three different length-to-diameter ratios. From Jordan.<sup>3</sup>

the curves slightly but not distort them. A lossy ground plane such as earth will affect the curves at extremely low elevation angles, which will shorten distances for ground-wave propagation,

Fig. 3—Input reactance vs. length in wavelengths for vertical antennas of three different diameter-to-length ratios. From Jordan.<sup>3</sup>

Fig. 4 — Vertical antenna for 7, 14 and 21 Mc.

but will not affect the shape of the curves at angles used by amateurs for sky-wave propagation.

The main objection to an antenna which is operated at different points in this 0.64- to 0.20-wavelength region is the radical change in input impedances between the bands where the antenna is current fed and the band where the antenna is voltage fed. By using a simple construction technique the amateur can approximate a cylindrical antenna of low enough length-to-diameter ratio to reduce materially these variations in impedance. Figs. 2 and 3 show the manner in which input resistance and reactance of a vertical cylindrical antenna vary with frequency in the region where the antenna is less than 0.65 wavelength long, and for antenna length-to-diameter ratios of 60:1, 100:1, and 5620:1. A length-to-diameter ratio of 5620:1 is equivalent to 30 feet of No. 14 wire.

### Practical Antennas

If the vertical antenna can be erected close enough to the rig to minimize transmission-line losses, the two antennas described here can be made to operate very satisfactorily. Fig. 4 shows

a 29.9-foot antenna with a 60:1 effective length-to-diameter ratio that operates very well on 40, 20, and 15 meters. The current distribution along the antenna at the center of each band is represented by the dotted lines. The values of input impedance, optional series inductance which may be used to cancel out the capacitive component of the input impedance, and the voltage standing-wave ratio with and without the series inductance, are all given for the center of each band. The v.s.w.r. values are for the case where the antenna is fed with 52-ohm coaxial cable. With this antenna the series inductance makes very little difference in cable loss; for example, at 7.15 Mc. the loss in 100 feet of RG-8/U cable without the inductance would be 0.62 db. and with the inductance it would be 0.55 db. At 21.225 Mc. the loss without the inductance is 1.9 db. and with the inductance it is 0.83 db. If this antenna is to be used extensively on 20 meters, the length of the feed line is of special importance. With the 9-to-1 v.s.w.r. which exists on 20 meters, the loss in 100 feet of cable will be 2.3 db. This will have the same effect as reducing a 100-watt rig to about 69 watts. With 50 feet of cable the loss will be

Fig. 5 — Vertical antenna for 11, 21, 27 and 28 Mc.

1.3 db., and with 25 feet of cable it is 0.7 db.

A vertical antenna for the 20-, 15-, 11-, and 10-meter bands is shown in Fig. 5. This antenna is 22.16 feet long with a 100:1 effective length-to-diameter ratio. The series condenser for use on 20 meters is relatively unimportant and may be omitted as it only reduces the loss in 100 feet of RG-8/U from 1.2 db. to 0.75 db.; however, on 11 and 10 meters the series inductance should be used unless a very short run of cable is used between the rig and the antenna. The loss on 11 and 10 meters is 3.7 and 3.6 db., respectively, for 100 feet of cable without inductance, and that loss is reduced to 1.2 and 1.0 db., respectively, when the series inductance is used.

### Construction Notes

The construction of the antenna is fairly simple, as shown in Fig. 6. The box construction with length  $D$  on a side approximates a cylindrical antenna of diameter  $D$ . The diameter of the four vertical wires is not critical, but should be

Fig. 6 — Physical construction of antennas.

as large as possible to reduce resistive loss. No. 14 wire is satisfactory and was used by the author, but a larger size would probably be an improvement. Either solid or stranded may be used.

The separators are not critical and may be plastic or treated wood. The spacing of the separators is dependent upon the tension used on the antenna; the more tension used the fewer separators needed. The author used ten separators for each antenna. The spring used at the top to provide the tension was an over-sized screen door spring obtained at the local hardware store.

The series inductances can be wound on any convenient low-loss form, and the size of wire, number of turns, spacing, and coil diameter may be picked to fit the specific installation.

The ARRL Lightning Calculator or any available coil table such as the one in *The Radio Amateur's Handbook*<sup>4</sup> may be used to wind the inductance required. The author found that No. 12 wire on a 1/2-inch synthane tube will work satisfactorily. The coils, if used, must be placed in a waterproof box and a stepping relay used to select the correct coil for each band, or to short out the coil(s) where none are required. The author strongly suggests keeping the coaxial cable short, connecting it directly to the antenna and not using any series reactance.

The use of ground radials is important, as with any vertical antenna. It is recommended that 4 or more buried radials be used and that they be more than 1/4 wavelength long at the lowest frequency to be used. The author has found that four 50-foot sections of aluminum clothesline running at right angles from the base of the antenna work very satisfactorily. One of these radials runs in one window of the basement of the house, along the basement ceiling and out the opposite window. In addition to the radials, a long (6 feet or longer) ground rod should be driven into the ground at the base of the antenna and connected to the junction of the radials and the outer conductor of the coax.

The antenna may be held up by any suitable means, but the most convenient, in most cases, will probably be a clothesline running between two suitable supports such as two trees, a tree and the house, etc.

It must be remembered that, as shown in Fig. 1, the vertical antenna has a low radiation angle; therefore, don't expect it to perform well at short ranges where a high angle of radiation is needed. The author has a horizontal dipole 35 feet above the ground for use on 40 meters. This antenna outperforms the 40-20-15 vertical when working nearby stations (30 to 200 miles) but when the band is open the vertical puts the dipole to shame.

## Silent Keys

It is with deep regret that we record the passing of these amateurs:

# Six Meters for the Beginner

## Part I — The Nature of the Band

BY EDWARD P. TILTON, W1HDQ

**E**XPERIENCE on the 2-meter band since Novices appeared on the scene has shown us what makes the wheels go around in amateur radio. Today we find Novices and former Novices almost everywhere, enjoying what the band has to offer. Hundreds started on 2 as WNs or KNs and, liking what they found, have stayed there after graduating to General Class status. This has been fine for 2-meter activity, but in attracting the lion's share of all v.h.f.-minded beginners, the 2-meter band has left its next-lower neighbor, the 50-Mc. band, with very little new blood.

The drive of the newcomer is vital to the growth of our hobby. Wherever he congregates, things *happen*; there is no substitute for his

boundless enthusiasm. It was with this thought in mind that the ARRL Board of Directors endorsed the proposal to open the 50-Mc. band to Technician licensees. Let's look over the characteristics of this recently somewhat-neglected band, and see what it has to offer the fellow who is just breaking into the game, at either the Technician or General Class level.

### Why Start on 6?

In v.h.f. circles, activity begets activity. Nothing discourages a potential v.h.f. operator more than to listen in and hear no signals. "There's nobody here," he concludes, "why should I go on?" But if he tunes across the band and hears people talking together he concludes that something interesting is going on, and he feels the urge to join in.

What the casual tuner-inner may misunderstand about the 50-Mc. band, if he finds it unoccupied at the moment, is that it is not *always* quiet. There are 6-meter men scattered all across the country who wouldn't give up the band for anything else in ham radio. They watch the band constantly. Perhaps you don't hear them for weeks at a time, but they're around. Just let a sign of DX show up and they'll be in there soon enough. Others crawl out from under

their rocks for every v.h.f. contest, and disappear promptly again when the party is over.

These are the old-time v.h.f. men, mostly. They have a wonderful time on 6, but their kind of operating is by no means enough to make things interesting for the beginner, or even the casual old-timer. Most hams want merely to talk with someone — and 6 is fine for that too, or it could be if more stations used it for that purpose. In fact, there is probably no better band in all the spectrum for friendly rag-chewing over distances up to 50 miles or more. It may not provide the strongest signals, or the best DX, but it certainly does afford the most consistent communication, within its reliable range, of any band we have.

The 50-Mc. band is in-between territory. It has the reliable coverage of higher v.h.f. bands and, like them, it is almost entirely free of serious interference problems. Yet it is low enough in frequency so that the ionosphere gets into the act now and then, opening the band up for DX that may be international or even world-wide in scope. Essentially, though, it is a local or extended-local band, for the DX is available only a small percentage of the total time each year. DX on 6, then, should be regarded as a spice, added occasionally to a satisfying daily fare, and not as an end in itself.

Even if we ignore DX entirely, the 50-Mc. band has much to interest the beginner. You don't need high power, or a tremendous antenna. You'll never have to peel the signals off in layers to get at the fellow you're trying to work. Equipment is simple to build, and easy to get going. Plenty of operators have enjoyed working on 6 with as little as 5 watts input, and the national average is probably well under 100 watts. Transmitters running more than 300 watts are a distinct rarity on 50 Mc. You may want to build a converter, to get the best possible reception, but a first-class job can be made with as few as two tubes. Circuitry and adjustment procedure are of elementary simplicity, as future articles of this series will show.

### Propagation at 50 Mc.

You'll have more fun and work more stuff on 6 if you acquire at least a nodding acquaintance with the ionospheric and atmospheric factors that affect your coverage. Knowing something of what to expect, and when, is at least half the battle.

One thing you'll notice right away is that signal strength from stations other than locals varies with the weather, and with the time of day. Stronger-than-normal signals, at 50 to

200 miles, and occasional reception up to 300 miles or more, result from bending of the transmitted wave as it passes through a boundary between air masses of differing temperature and humidity characteristics. If warm moist air overruns cold dry air we have the right condition for this kind of bending. It happens fairly often; daily, in fact, in warm weather, especially in areas adjacent to large bodies of water. Air-mass movement on a continental scale (the sort of thing you see recorded on the weather maps) can produce this sort of "inversion" over very large areas.

Good v.h.f. conditions lying along large-scale air-mass boundaries can develop at any season. This helps keep life interesting for the v.h.f. man during the winter months. A likely sign that favorable factors are present is the increasing high cloudiness that follows a period of fair calm weather. The barometer will be fairly high and steady preceding the good period, and it is probable that there will be a slow-moving "low" somewhere a few hundred miles to the west. Signals are usually strongest in the early daylight hours, and around sundown, though varying weather conditions may upset this schedule. Watch the weather maps presented daily on many television stations, or check those appearing in the newspapers, and you'll soon develop the knack of telling when things are going to be better than average on the v.h.f. bands.

Ionospheric DX is less predictable, at the present state of the art, but we know in a general way when it is most likely to show up. The most frequent form results from the reflection of the wave by scattered areas in the *E* region of the ionosphere, some 50 miles above the earth. It can happen any time, but it is most frequent in the early summer months. There is a less-pronounced period in late December and early January.

Sporadic-*E* skip, as it is most commonly known, is one of the 6-meter operator's real thrills. Signals appear suddenly, out of nowhere, and frequently rise to amazing strength. They may stay in for only a few minutes at a time, or the band may remain open for hours. Occasionally in June or July there may be DX signals around the clock. Signals are commonly heard over distances of 500 to 1200 miles, though dense ionization may bring the minimum skip distance down to 300 miles, or even less. Multiple reflections also extend the range to as much as 2500 miles, on occasion. It is thus possible for an alert 50-Mc. operator to work all states, and at least ten have qualified for the special certificate award that ARRL issues in recognition of this accomplishment.

Reflections from the auroral region offer another means of working beyond the normal range on 50 Mc. If you see "Northern Lights" on a clear night, aim your 6-meter array in that direction and you're likely to hear the weirdest-sounding signals you ever imagined. Voice or any other form of modulation is sure to be badly distorted, and may be completely unreadable,

making c.w. the only usable means of communication. Auroral conditions develop most often in the early evening, but they may show before sundown, so you have to watch radio conditions to catch all the opportunities. The distances over which auroral effects are noted extend from a few miles to as much as 800.

Around the peak of the sunspot cycle there is a chance of 50-Mc. DX of world-wide proportions. Between 1946 and 1950 many transatlantic and transpacific contacts were made, and North American stations worked several South American countries on 6. It may seem hard to believe, in these days when 28 Mc. is dead most of the time, and 21 Mc. only partially open, but working international DX was quite a sport on 50 Mc. in the spring and fall months of those years. Distances of 2500 to 5000 miles were common, and contacts were made with as little as 3 watts input! An almost unbeatable record of 10,500 miles was set in 1947.

So you see that just about all the factors that affect lower frequencies influence 50-Mc. communication at times, and in addition, it responds to weather variations. As propagation seldom remains stable for more than a few hours at a time, it is hard to say just what "normal" conditions really are. Perhaps it is better to talk in terms of minimum distances, rather than average, if we want to establish what the potential 6-meter operator may be able to work. Suppose you're going to run 50 to 100 watts input. You don't have room for a big tower, so you're planning to put up a 2- or 3-element rotary that won't stand out among the TV antennas. It will be no more than 50 feet above ground — perhaps less. What can you expect to do on 6?

Unless you're completely surrounded by nearby hills much higher than your antenna, you should be able to work at least 50 miles consistently, with stations similarly equipped. If you have a reasonably open location (not necessarily a high one), so that your antenna "sees" a horizon several miles away, your reliable operating radius should be at least 100 miles, and you should get in some contacts up to perhaps 200 miles when weather is favorable. If you have a hilltop site, and plenty of hams seem to manage it, you will find it possible to keep reliable schedules with well-equipped stations out to 200 miles or more, and 300-mile stuff will not be uncommon.

These very rough figures apply to tropospheric conditions only. Results in aurora or sporadic-*E* work are affected far less by the characteristics

of your location. In either department, the sharp operator in a "poor" v.h.f. location may do just about as well as his more fortunately-situated fellows.

### Equipment

The 50-Mc. transmitter need not be greatly different from gear used on lower bands. Most currently-used tubes work well on 50 Mc., and only a little attention to layout is needed to make an efficient r.f. section for 6. Any recent edition of *The Radio Amateur's Handbook* will give you practical ideas, or there are units you can duplicate, part for part, if you like.

Receiving may be more of a problem. As most hams buy, rather than build, when it comes to receivers, the lack of suitable ready-made gear has kept quite a few hams from enjoying 6 in recent years. Several commercial receivers have a "50-Mc. band" but few of them do a passable job. There are present indications of a change for the better, but you may have to build your own "front end" if you want to receive as far as you can transmit. If your receiver is the single-conversion variety, and nearly all more than two years old are, it probably won't "have it" for 50-Mc. work, without a converter. A few double-conversion jobs on the market show fair 50-Mc. performance, but all are in the higher-priced brackets. If your receiver is low- or medium-priced you're sure to need a converter, even though the receiver dial does indicate 50-Mc. coverage.

Fortunately, construction and adjustment of a 50-Mc. converter need frighten nobody. And if your receiver is in good working condition it doesn't make too much difference if it happens to be 15 years old, or one of the low-budget jobs. The *Handbook* can be your guide as to converter designs, and we have some new units in the works here in the ARRL lab. They will be tailored to the beginner's needs, and you'll be seeing them soon in *QST*.

The antenna is probably the most important part of the 50-Mc. station. Investment in the antenna system will yield greater returns than time and money spent elsewhere in the 6-meter station. You can work a radius of 25 miles or so with an indoor folded dipole, but you'll never know how much fun the band can be until you put up something better. In these days of inexpensive TV rotators and arrays on every roof, a 6-meter beam is within the reach of almost everyone. Whatever you put up for an antenna, make it rotatable. There is nothing more unsatisfactory, in most locations, than a fixed antenna. It will always be aimed in the wrong direction when your friends on 6 are working something good!

Even if you plan only a single element, arrange to be able to turn it. A dipole works surprisingly

well if it can be kept broadside to the desired incoming signal. But if you can put up a good dipole, with provision for rotation, you can add

at least one parasitic element. That first one really pays off, too, and even a 2-element beam will do a real job for you, if it is fed properly. Additional elements are worth the effort, too, if you can manage them. Make the antenna as big and as high as you can. Your *Handbook* gives you all the necessary design details.

### Problems — If Any

With our band at 50 to 54 Mc., and TV Channel 2 at 54 to 60 Mc., it is rough on the 6-meter man when his community gets a Channel 2 TV station. It may be rougher in a Channel 2 fringe area. TV receivers are just not capable of slicing it that thin. But there are many areas that do not have Channel 2 service, and for these the 50-Mc. band is relatively free of TVI problems. If moderate power is used and the rig is designed so as to prevent harmonic radiation<sup>1</sup> there is a very good chance of avoiding TVI entirely.

If some is encountered it is easy to cure. The writer has operated on 50 Mc. consistently since long before television, much of the time with high power, without running into any TVI problems that could not be solved readily. If you live in a 40-family apartment house you may not want to try it, but if you can manage 100 feet clearance from your neighbors' TV antennas, operating on 6 should pose no threat to neighborhood peace. You may have to put a 300-ohm stub on here and there, but unless you're blessed with Channel 2 you'll need nothing more pretentious in the way of TVI-preventive measures than a few scraps of Twin-Lead. Even in Channel 2 areas, the problem is by no means hopeless, as W21DZ showed recently in *QST*.<sup>2</sup>

Here, then, is the 50-Mc. picture, presented in the frankest possible terms. As one of the band's long-time regulars, the writer feels — with several hundred other die-hards — that anyone who has not given 6 a real try has missed one of the great experiences that ham radio has to offer. We hope that in years to come many newcomers will share this opinion. To help them along the way, we've been working for some time on several transmitters and receivers designed especially for the beginner. You'll be seeing them in forthcoming issues of *QST*.

<sup>1</sup> Tilton, "TVI Hints for the V.H.F. Man," April, 1953, *QST*. Also 1954 and 1955 editions of *The Radio Amateur's Handbook*, Chapter 23.

<sup>2</sup> Ladd, "50-Mc. TVI — Its Causes and Cures," June and July, 1954, *QST*.

The transmitter covers 160 through 10 meters, and uses standard chassis and bottom plates to provide complete shielding for TVI. The panel is 7 by 19 inches.

## Easy Shielding for Ninety Watts

*The 'Bandbox' and a 6146 Pi-Network Amplifier*

BY RICHARD L. BALDWIN,\* WIIKE

• This is a neat little package combining Don Mix's "Bandbox" frequency-multiplying unit with a 6146 amplifier using a continuously-variable inductor in a pi-network tank. The construction is such that the unit is self-shielding for TVI — with only one very simple metal piece requiring fabrication.

**T**HIS RIG has two virtues which should recommend it to those who like to build their own gear. First, it is completely and rapidly bandswitched from 160 through 10 meters, without plug-in coils; and second, it is of a mechanical design that allows a maximum of TVI reduction with a minimum of sheet-metal work.

\* R.F.D. 1, Cumberland Center, Maine.

<sup>1</sup> Mix, "The 'Bandbox' — A Single-Control Frequency Multiplier," *QST*, April, 1952. See also p. 52, *QST*, September, 1952.

### Circuit

An inspection of the circuit diagram, Fig. 1, will show you that there is nothing new and tricky here. The front end of the transmitter consists of Don Mix's "Bandbox," slightly modified electrically by the addition of another switch section so that if a VFO with 160-meter output is available, that VFO output can be applied to the grid of the final tube. It was also modified mechanically to fit this particular layout. The final tube is the popular 6146, with a variable inductor and pi network so that no coils have to be changed when shifting bands.

TVI has been reduced to a minimum by complete shielding, by the use of shielded wire for all d.c. leads, and by appropriate by-passing of all leads leaving the chassis. A coil shield covers the meter, and the only possible "hole" is the socket on the rear panel for the power plug. But all leads there are by-passed and no r.f. can be detected leaking out.

The amplifier is set in a "dish" (see Fig. 3) in a cut-out section of the two back-to-back chassis. This view is looking down into the transmitter with the top plate off. The tubes in the "Bandbox" exciter section are at the left.

## Layout

Looking at the transmitter from the front, the exciter portion occupies the left half of the chassis, while the final occupies the right half. The panel controls, reading from left to right, are the bandswitch controlling the exciter, exciter tuning, the meter switch, plate capacitor for the 6146, variable inductor for the 6146, and the switch for the loading capacitors. The meter is in the upper center, while a chart in the upper left attempts to balance the extra counter dial on the variable inductor.

Along the rear of the chassis are the coax connector for VFO input, the power socket, and the coax connector for r.f. output.

Looking at the top of the transmitter, we see the tubes for the exciter standing at attention at the left, with the shield can for the meter front and center. The final is set in a "dish," with the variable inductor right in the center, the tube left rear, variable capacitor left front, and loading capacitor switch at the right. In order to obtain better operation at 10 meters and in order to cover 160 meters at all, inductance  $L_6$  is broken up into three sections.  $L_{6A}$

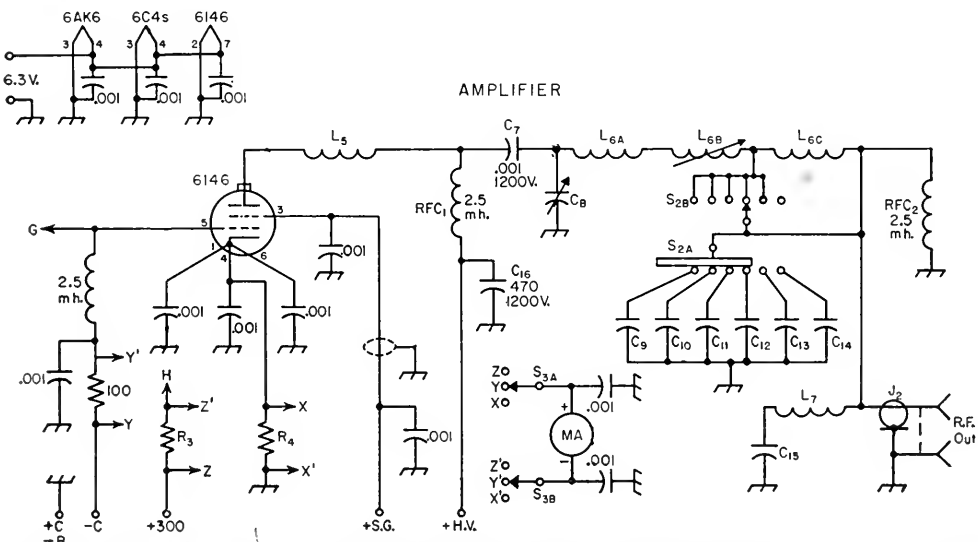

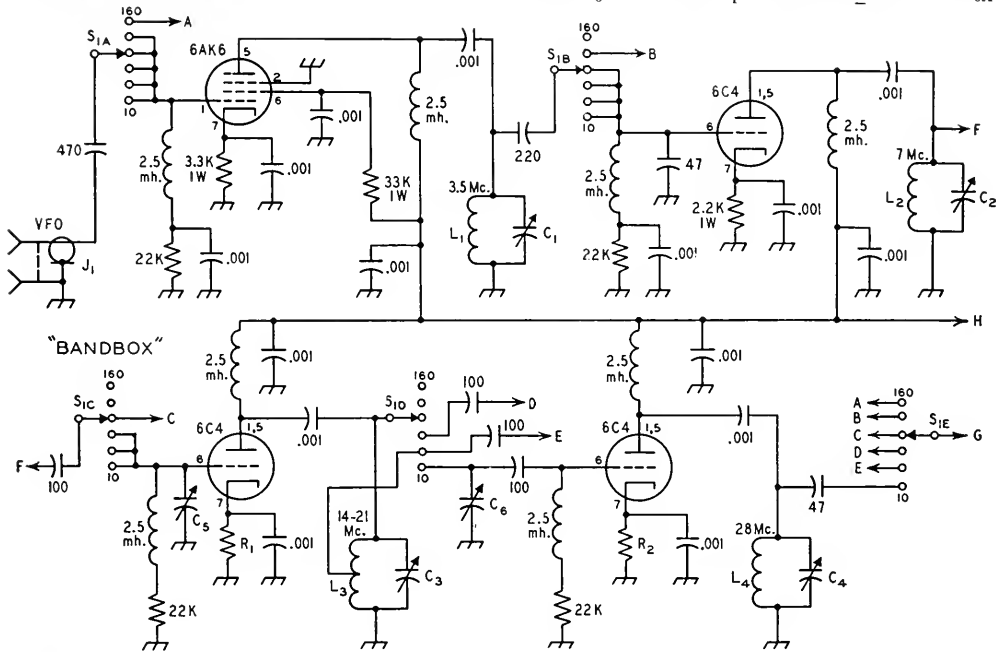

Fig. 1 — Wiring diagram of the transmitter. The section above the dashed line is the "Bandbox" frequency-multiplier unit. All resistors  $\frac{1}{2}$  watt unless otherwise specified. Capacitor values below 0.001  $\mu\text{f.}$  are in  $\mu\text{mf.}$  All 0.001- $\mu\text{f.}$  capacitors except  $C_7$  are 500-volt disk ceramic; others are mica.

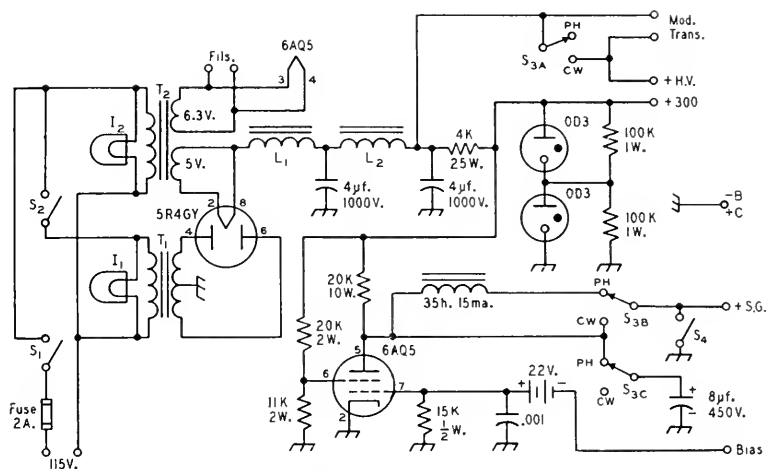

Fig. 2 — Power-supply and clamp-tube circuit.

$L_1$  — Swinging choke, 5-25 henrys, 20-200 ma. (Triad C-31A).  
 $L_2$  — Smoothing choke, 10 henrys, 200 ma. (Triad C-16A).  
 $S_3$  — 3-pole 2-position ceramic switch, nonshorting (Centralab 2507).

$I_1, I_2$  — 115-volt pilot lamp.  
 $T_1$  — Plate transformer; for 750 v. d.c., 225 ma. (Merit P-3159).  
 $T_2$  — Filament transformer: 5 v., 3 amp. and 6.3 v., 6 amp. (Stancor P-5009).

consists of four turns of B & W Miniductor No. 3009, and resonates in the 10-meter band when  $L_{6B}$  is shorted out by running the contactor all the way down to the end. Operation on 15 meters through 80 meters is accomplished with  $L_{6A}$  working in series with  $L_{6B}$ , with  $L_{6B}$  being adjusted for more and more inductance as we progress from 15 to 80 meters.  $L_{6C}$  consists of  $1\frac{3}{4}$  inches of B & W No. 3907, which, in conjunction with  $L_{6A}$  and  $L_{6B}$ , will resonate on 160 meters. It was removed for the photographs because it hid too many of the other components. It is customarily supported between the rear terminal on  $L_{6B}$  and the pillar insulator (National GS-3) located at the right rear of  $L_{6B}$ . On bands other than 160 meters it is shorted out by an extra wafer section ( $S_{2B}$ ) of the loading-capacitor switch.

The circuit of the power supply used in conjunction with the transmitter is shown in Fig. 2. A pair of 816s was used originally, but they generated a hash on 80 meters which would not clear up with any of the combinations of filter tried, and so they were replaced with the single 5R4GY. The clamp circuit is one that has been described several times in recent issues of *QST*.

The VFO that has been used with this rig has a couple of 6AG7s in a Clapp oscillator and buffer, and is keyed with a Millisec relay according to Goodman.<sup>2</sup>

### Construction

In order to obtain complete shielding, two  $3 \times 8 \times 17$ -inch chassis were bolted together back to back, or top to top, depending upon how you look at it. The Bandbox exciter is then built in the left-hand portion of the resulting

<sup>2</sup> "Improved Break-In Keying," *QST*, March 1948.

$C_1$  — 65- $\mu$ f. variable in parallel with 100  $\mu$ f. silver mica.  
 $C_2$  — 35- $\mu$ f. variable in parallel with 3-30- $\mu$ f. mica trimmer and 47- $\mu$ f. silver mica.  
 $C_3, C_4$  — 25- $\mu$ f. variable in parallel with 3-30- $\mu$ f. mica trimmer.  
 $C_5, C_6$  — 3-30- $\mu$ f. mica trimmer.  
 $C_7$  — Mica.  
 $C_8$  — 300- $\mu$ f. variable, 0.026" spacing (National TMS-300).  
 $C_9, C_{10}$  — 100- $\mu$ f. mica  
 $C_{11}, C_{12}, C_{13}$  — 200- $\mu$ f. mica  
 $C_{14}$  — 500- $\mu$ f. mica  
 $C_{15}$  — 100- $\mu$ f. mica (see text).  
 $C_{16}$  — Mica.  
 $R_1$  — Two 4700-ohm 1-watt resistors in parallel.  
 $R_2$  — 4700-ohm 1-watt in parallel with 3300-ohm 1-watt.  
 $R_3, R_4$  — Meter shunts; see text.  
 $L_1$  — 12  $\mu$ h.; 24 turns No. 22 d.c.e., 1-inch diam., close-wound.  
 $L_2$  — 4.2  $\mu$ h.; 17 turns,  $\frac{3}{4}$ -inch diam.,  $\frac{1}{32}$  inch long (B & W Miniductor No. 3012).

$L_3$  — 1.8  $\mu$ h.; 12 turns,  $\frac{3}{4}$ -inch diam.,  $\frac{3}{4}$  inch long tapped 6 $\frac{1}{2}$  turns from ground end (B & W Miniductor No. 3011).  
 $L_4$  — 0.4  $\mu$ h.; 7 turns,  $\frac{1}{2}$ -inch diam.,  $\frac{7}{16}$  inch long (B & W Miniductor No. 3003).  
 $L_5$  — 8 turns No. 18,  $\frac{1}{4}$ -inch diam.,  $\frac{5}{8}$  inch long.  
 $L_{6A}$  — 0.3  $\mu$ h.; 4 turns,  $\frac{3}{4}$ -inch diam., 1 inch long (B & W Miniductor No. 3009).  
 $L_{6B}$  — 10- $\mu$ h. variable (Johnson 229-201).  
 $L_{6C}$  — 11  $\mu$ h.; 18 turns No. 16, 2-inch diam.,  $1\frac{3}{4}$  inches long (B & W No. 3907).  
 $L_7$  — See text (forms TV harmonic trap with  $C_{15}$ ).  
 $J_1, J_2$  — Coax connectors  
 $S_1$  — Ceramic switch; 5 sections, 6 positions.  
 $S_2$  — Ceramic switch; 2 sections, 6 positions; Centralab P1S section (for  $C_9$ - $C_{14}$ , inc.) and type X section (for  $L_{6C}$ ).  
 $S_3$  — Bakelite wafer switch; 2 poles, 3 positions.  
Note:  $C_1, C_2, C_3$ , and  $C_4$  are ganged. See Reference 1 or *The Radio Amateur's Handbook*, 1953 or 1954 edition, for method of adjusting tuned circuits for proper tracking.

The exciter section extends along one end of the chassis, as shown in this bottom view. The bottom of the amplifier dish is at the left. The switch at lower center is the meter switch.

enclosure, exactly as previously described by Mix, except for the extra switch section and except for a mechanical rearrangement so that the dials would line up symmetrically along the panel. The cut-out for the final is 7 inches wide and 8 inches long, and a shelf to support the components for the final hangs down  $2\frac{3}{4}$  inches below the cut-out. Fig. 3 shows the

Fig. 3—The "dish" for the final amplifier. It is bent from aluminum sheet.

dimensions of this shelf, as its configuration is not clearly shown in the photos.

The 6146 is mounted on a small bracket at the left rear of the shelf. Capacitor  $C_8$  is in front of the tube, mounted on a couple of small aluminum spacers so that its dial will be in line with the others. Between  $C_8$  and the tube are  $RFC_1$  and  $C_7$ . Parasitic choke  $L_5$  is supported between the junction of  $C_7$ - $RFC_1$  and the tube plate cap.  $C_{16}$  is connected to the high-voltage lead at the power plug where the lead leaves the chassis. Coil  $L_{6A}$  shows up poorly in the photos, but is supported by a National GS-3 pillar insulator (mounted to the left and in front of the variable inductor) and the terminal of the variable inductor. It is at right angles to  $L_{6B}$ , the roller coil.

At the right rear edge of the variable inductor is the GS-3 insulator which normally supports  $L_{6C}$ , and directly behind that is the safety choke  $RFC_2$ . Switch  $S_2$  is at the far right; one section switches the loading capacitors which are clustered to the rear of the switch and the other

section shorts out  $L_{6C}$  on all bands other than 160 meters, as mentioned earlier. Just barely visible in the photograph is the coil portion of the harmonic trap  $L_7C_{14}$ .

Top and bottom plates are 8 by 17 inches, and are secured by  $\frac{1}{4}$ -inch 6-32 screws spaced every 2 inches around the edges of the chassis. The chassis material is rather light, but if care is used it may be drilled and tapped with good results. Just don't tighten up on the 6-32s too strenuously. The 7-inch panel is held to the chassis by the various tuning controls and panel bearings, and by the bolts which hold the meter and meter shield in place. The meter shield is an ICA No. 1540 coil shield, cut down so that it is only 2 inches high.

The only other piece of mechanical work that is at all unusual is the counter for the variable inductor. At the time this transmitter was conceived the only counters obtainable took up more room on the panel and behind it than was available, and so a homemade counter was contrived using Boston gears Nos. G142 and G148, some G29 pinion wire, two panel bearings, a couple of aluminum brackets, and a surplus dial. Fig. 4 shows the method of assembly. The

Fig. 4—Sketch of drive and indicator for the final-tank variable inductor. The gears are standard items.

Miscellaneous small parts in the power supply are mounted below chassis, as shown in this photograph.

counter dial on the panel was taken from a surplus tuning unit, and was mounted by drilling and tapping the shaft on which the G148 spur gear was mounted. Incidentally, the spur gears come with hubs which have to be drilled and tapped in order to allow fastening to the shafts.

Now for a few miscellaneous notes on the construction and wiring. You should do all necessary by-passing and other wiring at the 6146 tube socket before mounting it and its bracket in position. There is not enough room to get down between it and the edge of the shelf with any ordinary soldering iron. A series of  $\frac{1}{4}$ -inch holes is drilled below the tube in the shelf, in line again in the bottom plate and in the top plate, to provide ventilation for the 6146. The now-standard practice of using shielded wiring on the d.c. leads is followed in this rig, with plenty of bonds to the chassis at convenient points. The meter shunts were wound by trial and error, using a rheostat, battery, and full-range milliammeters to determine the shunts needed. The shunt for measuring exciter current extends the 10-ma. range of the meter to 100 ma., while the shunt for the 6146 plate current extends the range to 200 ma. No shunt is needed for the 6146 grid current. The panel markings are Tekni-Cals.

### Operation

Adjustment of the exciter has been fully covered by Mix, and so need not be detailed further. It might be mentioned, however, that the exciter worked right from the moment plate voltage was first applied, and the process of aligning it was very simple. Thus, if the speci-

fications in the original article are followed you will have no difficulty with that part of the circuit.

In the final the harmonic trap is adjusted by resonating the  $L_7$ - $C_{15}$  combination to your local TV channel. Do this by shorting the coax-connector terminals and coupling  $L_7$  to a grid-dip meter. In my case  $L_7$  consists of three turns of No. 18 wire wound to a  $\frac{1}{4}$ -inch diameter, while  $C_{15}$  is 100  $\mu\text{f}$ .  $L_7$  was then adjusted until the circuit hit Channel 6.

The values of the loading condensers were picked by going back to the early articles on the pi network. I had to make no further adjustment, and so in this case blind luck triumphed over science.

The 80-meter band is tuned with all of  $L_{6B}$  in the circuit, 40 is tuned with about 12 turns of  $L_{6B}$  in the circuit, 20 meters with about 7 turns, and 15 meters with about 5 turns. For 10 meters,  $L_{6B}$  is shorted out altogether by running the contactor all the way to the end of the coil. These adjustments could vary depending upon what kind of load your transmitter has to feed.

A word of caution about the 6146 is in order. It appears that this tube is particularly susceptible to overloads, and so you should exercise care not to allow it to operate off-resonance; otherwise, you will soon end up with a tube exhibiting grid emission.

This rig has been used by itself, with an antenna coupler, as a very nifty low-power transmitter. It was used with success during the 1953 and 1954 SS contests, and the TV receiver in the next room never knew it was on the air. It has also been used to drive a pair of triodes running a kilowatt input.

Major components of the power supply, which is built on an  $8 \times 17 \times 2$ -inch chassis. The voltage regulator tubes, clamp tube and bias battery are at the right-hand end in this view. The "plate switch" socket beside the 115-volt connector on the chassis lip is wired in parallel with the front-panel plate switch and is for remote control of the plate voltage.

# A One-Tube Receiver for the Beginner

## *The 6U8 in a Regenerative Receiver*

BY LEWIS G. MCCOY, W1ICP

• The easiest way to break into the receiver-construction game is to build a regenerative receiver. Here is a "one-tube" regenerative receiver that is easy to put together and has performance equal to any in its class. And, after all these years, it has an honest-to-goodness antenna coupling circuit.

JUDGING from the mail here at Headquarters, it would appear that one of the many questions facing the newcomer is whether to buy or build his first receiver and transmitter. The answer to that depends on whether one is interested in just operating or in learning about radio. If you want to understand radio, the only real way to acquire experience is by building your own equipment. At least at the beginning.

This article describes the construction of a simple one-tube regenerative receiver that will fulfill the basic requirements for communications work. The title of the article states that the receiver is a one-tube job. Actually, it uses two tubes in one envelope—envelope meaning the glass enclosure. The 6U8 is a triode-pentode, and in this receiver the pentode section is used as a regenerative detector and the triode portion as an audio amplifier.

With this receiver it is possible to hear amateur and commercial stations in the 2- to 20-Mc. range. This tuning range will enable the builder to listen to the two low-frequency Novice bands. Also, if one is interested in obtaining code practice, W1AW, the ARRL Hq. station, can be tuned in for its nightly code-practice sessions.

### *The Circuit*

The circuit used in this receiver differs in a few places from the usual regenerative-receiver circuit. For example, instead of the usual small antenna-coupling capacitor or inductor, provision

was included here for either a series- or parallel-tuned antenna circuit. This allows a wide range of coupling adjustments to be obtained, as is often necessary with regenerative receivers.

Referring to Fig. 1, the antenna coil,  $L_1$ , couples the signal to the detector tuned circuit  $L_2C_2C_3$ . The capacitor,  $C_2$ , is larger than  $C_3$  and is used as the "bandset" capacitor—once  $C_2$  is set for a particular frequency range,  $C_3$  is used as the "bandspread" tuning control. To facilitate using manufactured coils, the coil  $L_2$  is tapped to obtain a feed-back or "tickler" winding. Regeneration in the detector is controlled by changing the screen voltage obtained at the potentiometer  $R_1$ . An r.f. filter, using two capacitors and an r.f. choke, is placed in the plate circuit of the pentode detector to reduce r.f. appearing at the grid of the triode audio amplifier. Still further attenuation of r.f. at the grid is obtained through the use of a series resistor and a shunt capacitor right at the grid of the audio stage. To save a little money, the audio coupling choke,  $L_3$ , is made from an inter-stage audio transformer with the two windings connected in series. A high-inductance choke could be used here, but the series-connected transformer does a good job and is less expensive.

The headphones are connected directly in the plate circuit of the audio stage, and consequently the plate voltage appears at the terminals—you can get an electrical shock here if you aren't careful. Some receivers eliminate this hazard by feeding the plate through an audio choke and coupling to the headphones through a capacitor, but again in the interest of saving a few dollars this protective feature was not included. In any event, be sure to use "high-impedance" headphones with this receiver—the low-impedance headphones that have been available in surplus will not work well in this particular circuit.

### *Construction*

The receiver is built on a  $7 \times 7 \times 2$ -inch aluminum chassis, with the power supply mounted on

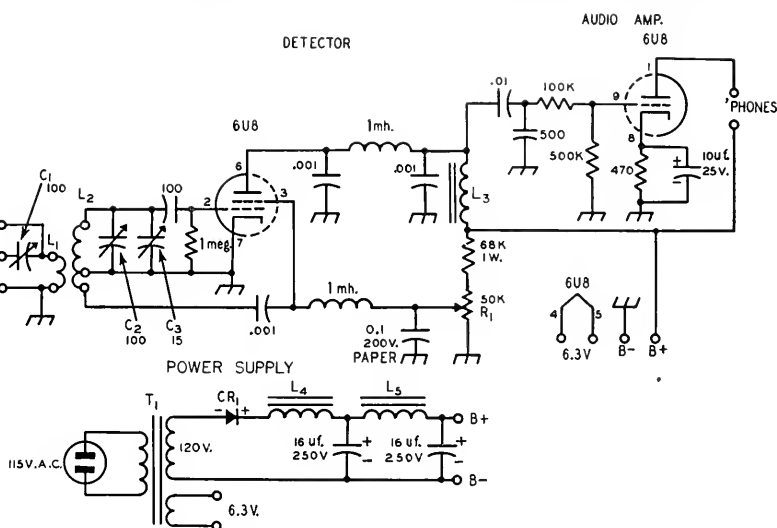

Front view of the receiver and power supply. The control at the upper left is the general-coverage tuning, center is bandspread, lower left the regeneration control, and the bottom center the antenna trimmer.

and the headphone tips are at the lower right. The knob at the upper left is for the general-coverage capacitor, and the one at the right the bandspread tuning. The dial shown in the photograph is the National type K. This has a rim drive and gives a desirable slow tuning rate.

The first step is to mount the coil and tube sockets. They are spaced 2 inches from the sides at the center of the chassis. Ground lugs should be mounted under the nuts that hold the tube socket and also under the rear nut holding the coil socket. Next, the panel holes are drilled.

Looking at the photograph showing the panel front, the knob at the lower left is the regeneration control, lower center is the antenna trimmer,

The two capacitors,  $C_2$  and  $C_3$ , should then be

*Fig. 1* — Circuit diagram of the one-tube regenerative receiver. See page 138 for parts list.

Bottom view of the two units. At the lower left in the receiver is the interstage transformer  $L_3$ . To the right of  $L_3$  is the antenna-trimmer capacitor mounted on a right-angle bracket. Immediately in front of the bracket is the insulated shaft coupler which connects the through-shaft bushing to the antenna trimmer.

The selenium rectifier in the power supply is visible between the two electrolytic capacitors.

ins. allied on the panel. If the Type K dial is used, a template is furnished with the dial assembly to give the correct placement points for the dial and rim drive. When the potentiometer  $R_1$  and the pin jacks are mounted in place, they will hold the panel to the chassis. Be sure to insulate the pin jacks from the panel and chassis with fiber washers. The through-shaft bushing is measured and cut to size, making allowance for the insulated coupler. The receiver is now ready for wiring.

### Wiring

If this is your first construction project, there are a few tips about wiring and soldering that will help you do a good job. First, be sure the end of the wire to be soldered is completely clean of insulation or enamel. Solder should not be depended on to hold the connection. Whenever possible, wrap the wire around the connection before applying solder. Hold the tip of the iron against the work until the work is hot enough to melt the solder. Where most beginners make a mistake is in holding the solder to the iron tip and not getting the connection hot enough for the solder to melt and hold. Don't use any more solder than necessary to make the connection. After a connection is soldered, dispose of the loose bits of solder and wire to avoid short circuits to other connections.

Although it is not shown in the diagram, it is important that a separate ground lead be connected to the rotors of  $C_2$  and  $C_3$  and the lead brought below the chassis to a common grounding point at the tube socket. This will help make the receiver stable and reduce hand capacity.

There are five leads coming from the interstage transformer: red, blue, black, and two green. The red lead and green lead that are directly opposite each other are connected together. After the leads are soldered and taped, the end of the black lead is also taped. These leads are then rolled up and tucked in the corner of the chassis. The remaining blue and green leads then become those used for wiring the series-

connected transformer into the circuit. One is connected to the junction of the 0.01- $\mu$ f. disk capacitor and the 1-millihenry r.f. choke and the other lead is connected to the B+ voltage terminal.

The Barker & Williamson coils are mounted on five-prong plugs, although only four of the contacts are used. The link mounted at one end of the coil is  $L_1$  and the coil proper is  $L_2$ . To make the tickler tap, a short piece of hook-up wire approximately 3 inches long is soldered to the fifth prong on the plug. The piece of wire is then run through the middle turns of the coil and soldered to the tap point. For the 80-meter coil, the tap is connected to the 8th turn in from the link end. To get the tap wire through the middle turns of the coil, it will be necessary to bend two or three turns of the coil in towards the center of the coil. This will provide sufficient clearance for the tap lead. It is also necessary to bend in the 8th turn to make the tap connection. Be sure that none of the bent turns touches adjacent turns.

For maximum bandwidth on 40 meters, it is necessary to remove nine turns from the 40-meter coil. The turns are taken from the end opposite the link end of the coil. The tickler tap is made on the 4th turn end from the link end.

To bandwidth the 20-meter coil, two turns are removed from the end opposite the link end. The tap is placed on the 4th turn from the link end. In all three coils, the tap lead should be insulated where it passes through the coil turns.

### Power Supply

The power-supply components can now be wired. There are two important points that beginners should keep in mind when wiring the supply. The first is that the electrolytic capacitors should be wired with the leads marked with a minus sign, or negative, connected to the chassis. The plus sign, or positive, connects to the choke leads. Likewise, the selenium rectifier is marked with a plus sign, and this lead is connected to the

# A Compact Two-Tone Test Generator

## Dual A.F. Phase-Shift Oscillators for Modulation Checking

BY ROBERT F. TSCHANNEN,\* W9LUO

• This unit provides two audio frequencies of your choice for checking the performance of a linear amplifier. In case you use any of the various two-tone techniques that require only one audio frequency, or want a low-distortion tone for a.m. testing, just use one-half of the circuit diagram.

THE true performance of a single-sideband exciter and linear amplifier is difficult to predict without a few pieces of test equipment. Probably the most important item of test equipment for this purpose is the oscillograph; however, a most useful and helpful companion unit is a low-distortion audio source — better still, a pair of audio sources.

The "Two-Tone Test Generator" described below is designed to provide two independent low-distortion audio test signals. The unit is small and compact and uses only two tubes. No special components are used in the construction of the unit. If the generator is carefully made and adjusted, the total harmonic distortion can be as low as 0.1 per cent.

### The Basic Circuit

The basic circuit of a phase-shift oscillator is shown in Fig. 1. Operation depends upon producing 180-degree phase shift in the RC network consisting of three capacitors and three resistors; sufficient gain must be produced by the oscillator tube to make up for the loss in the network. For

the circuit shown, a gain of 29 times is required to sustain oscillation (Reference 1, bibliography). The frequency of oscillation is determined by the equation

$$f = \frac{10^3}{2\pi\sqrt{6RC}} = \frac{10^{12}}{15.4RC}$$

where  $R$  is in ohms and  $C$  is in micromicrofarads. If the oscillator tube has a gain less than 29, oscillation will not begin; if excessive gain is obtained, appreciable distortion may be produced.

Fig. 1 — The basic phase-shift oscillator circuit.

The phase shift through the network at harmonic frequencies is always less than 180 degrees and in some cases approaches zero. This gives rise to negative feed-back which reduces the gain at harmonic frequencies; therefore, essentially a pure sine wave results. Maximum harmonic reduction occurs at the point where the system is just able to sustain oscillation.

### General Circuit Description

A single 6AN8 tube is used as oscillator and output section for each channel of the generator. The pentode section functions as the oscillator

The two-tone test generator is a compact and inexpensive unit and provides two audio signals of different frequencies and equal amplitudes for testing any type of s.s.b. generator. Distortion is extremely low if proper care is used in adjustment.

Arrangement of parts below chassis. The two oscillator-buffer circuits are identical in circuit but not in component values. The three electrolytic condensers in the power supply are contained in a single can-type unit (Mallory 311.9) thus conserving space underneath.

proper; the triode section operates as a cathode follower output. A half-wave selenium rectifier followed by considerable filtering provides good d.c. for the oscillators. The complete schematic is shown in Fig. 2.

The 1000-ohm controls in the cathode circuits of the pentode stages are used for controlling distortion. The controls permit adjustment of the oscillator tube gain to the point where oscillation will just be sustained. This also corresponds to the point where minimum distortion occurs. Two additional 1000-ohm controls in the cathodes of the triode cathode followers provide control of outputs from either channel.

The  $R$  and  $C$  component values for the networks shown in the schematic of Fig. 2 are approximately correct for the generation of 400- and 1000-cycle tones. Other values are given in Table I.

It is important that the linearity of the cathode follower be good since otherwise distortion may be added by this stage. The use of a low- $\mu$  triode tube such as the triode portion of the 6AN8 permits the handling of higher grid swings without distortion. Since the signal handled is small, the possibility of distortion becomes negligible. The effective output impedance of the cathode follower is approximately equal to

$$\frac{10^6}{g_m}$$

in shunt with the cathode resistance to ground (where  $g_m$  is the transconductance in micromhos). The output impedance is therefore of the order of only several hundred ohms. This is desirable since output signals may readily be coupled into a combining network without appreciable interaction. The tapped-down take-off point from the plate of each oscillator tube reduces external loading on the oscillator and

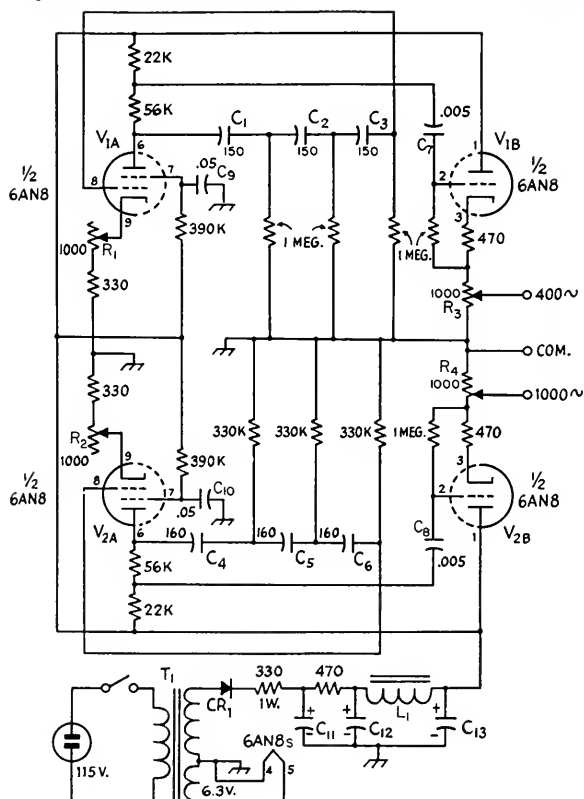

Fig. 2 — Circuit of the dual a.f. test oscillator. Resistors are  $\frac{1}{2}$  watt, 10 per cent tolerance, unless otherwise specified. Capacitance values below 0.001  $\mu$ f. are in  $\mu$ mf. Potentiometers are linear-taper 1-watt composition.

C<sub>1</sub>-C<sub>6</sub>, inc. — Silver mica, 5 per cent tolerance.

also reduces the output level to the point where the cathode-follower grid circuit can handle the signal without distortion.

When used for lowest distortion, the output of either channel is of the order of 1 to 1.5 volts r.m.s. Output levels of 8-10 volts r.m.s. are obtainable if a few per cent distortion is tolerable. The increased output capability is obtained by readjusting the oscillator cathode resistance.

The total "B" current drain of both oscillators and output stages is about 16 ma. Line-voltage variations do not greatly influence the

Fig. 3 — Improper operating conditions are shown by 'scope traces. A — Excessive oscillator tube gain. B — Excessive oscillator tube gain, but not as much as in A. C — Same as B except with change in 'scope sweep speed to facilitate estimating second-harmonic distortion by the degree of asymmetry ( $X$  greater than  $Y$ ). D — Optimum symmetry ( $X = Y$ ), minimum even-order harmonics, low distortion in output.

oscillator frequency; therefore voltage stabilization is not required. Larger screen by-pass and coupling capacitors do not add particularly to the performance of the unit since fixed-frequency operation is used.

Typical voltage readings taken with a d.c. v.t.v.m. are as follows:

- 1) B+ at output of filter = +120 to +130 volts.
- 2)  $E_{sg}$  = +30 to +40 volts.
- 3)  $E_p$  = +55 to +80 volts.
- 4)  $E_k$  (pentode) = 0.2 to 0.3 volt.
- 5)  $E_k$  (triode) = 6 to 7.5 volts.

### Construction

The chassis layout of the phase-shift oscillator is not critical. The entire unit is constructed on a  $5 \times 7 \times 1\frac{1}{2}$ -inch chassis. The grid leads of the oscillator tubes are preferably kept short and dressed away from a.c. supply and filament leads. One side of each filament of the 6AN8 tubes is grounded. The photographs of the chassis will assist the builder in making a suitable layout. The small power transformer is capable of supplying as many as four individual oscillators. If desired, a 6X4 rectifier may be substituted in

place of the selenium rectifier; in this case the 330-ohm 1-watt current-limiting resistor in series with the rectifier may be removed.

Miniature silver mica capacitors were used in the phase-shift networks for compactness; however, conventional micas may be used successfully if space is available. The coupling capacitors  $C_7$  and  $C_8$  may be Hi-K disk ceramic or paper types. Components for the phase-shift network are mounted on terminal strips or boards for rigidity and neatness. The capacitors  $C_1$  through  $C_6$  are not visible in the bottom view since they are beneath the terminal strips which are located on each side of the chassis. The controls  $R_1$  and  $R_2$  are located on each side of the electrolytic filter capacitor. The output controls, a.c. switch, and output tip jacks are on the front flange of the chassis. The layout shown will provide good accessibility to nearly all components.

### Adjustment & Checking

After the wiring has been completed and checked the unit may be turned on and each output observed on a 'scope. If no output appears, adjust the cathode resistor of the oscillator to just slightly beyond the point where oscillation starts.

With the values of cathode resistances shown on the schematic, it should normally be possible to stop oscillation near one end of the control and produce high (but slightly distorted) output near the other end of the control. At the point where the distortion becomes noticeable, the wave will usually have an appearance similar to that shown in Fig. 3A or 3B, which indicates even-harmonic distortion (principally second). If a distortion meter or wave analyzer is available it will be simple to adjust each cathode control to the point where lowest distortion is obtained. Since such equipment is seldom available to the ham or experimenter, a reasonable means of minimizing the distortion is to apply the signal under test to the vertical plates of a 'scope and adjust the horizontal sweep speed until a pattern similar to Fig. 3C is obtained. The distortion control can now be rotated until dimensions  $X$  and  $Y$  are as nearly equal as possible (see Fig. 3D). In other words, if  $X$  and  $Y$  are made equal, any asymmetry due to second harmonic distortion is negligible.

# The All-Electronic "Ultimatic" Keyer

## Part II — How It Works

BY JOHN KAYE,\* W6SRV

• Part I (QST, April, 1955) of this article described what the key does and how it can be built. Here is the explanation of the circuits and pertinent test data. Part I is required, since it carries the circuit diagram.

THE electronic Ultimatic is best considered as two separate units, a code generator and a selector-memory-sequencor (SMS). The generator is composed of a time base, two character-generating triggers, and a relay-control tube or an optional d.c.-output tube for direct control of vacuum-tube keyers. The SMS comprises a twin-lever key, two memories, two interlocked-sequencor circuits, two multiple-character holding circuits, and two sequence-seizure circuits. This SMS structure is completely symmetrical. One side only will be discussed. Each paragraph concerning it can also serve to describe the other side by substituting "dot" for "dash" and vice versa and considering the corresponding circuit components. Refer to Part I for the circuit diagram. To extend the stability range, grid-current loading is used in several places. For this reason, some of the voltages to be cited will differ from those calculated from straight voltage-divider action of resistor strings.

### Time Base

The multivibrator,  $V_1V_2$ , generates a sufficiently-square wave at its cathodes from which  $C_2R_4$  differentiates alternate positive and negative pulses for operation of the generator triggers. The "mark/space" ratio of this type of oscillator has been found to be substantially independent of plate voltage over a wide range, and consequently, no voltage regulation is required. The elevated grid return of  $V_1$  provides a mark/space ratio of 45/55 with  $R_3$  at ground, increasing to 90/10 before failure as the arm is moved toward the cathodes. A capacity of 0.05 $\mu$ f. at  $C_1$  gives a minimum speed below 5 w.p.m. and a maximum above 100. Heaven forbid anyone turning it loose on me!

### Relay Output

During spacing, the relay is energized because the grid of  $V_3$  is held at ground potential at the junction of  $R_{12}$  and  $R_{13}$ . The normal "back" contact is used to key the external circuit. On "mark" the junction of  $R_{12}$  and  $R_{13}$  drops to -15 volts, cutting off  $V_3$ . Relatively heavy spring tension on the relay minimizes armature travel

time. When the grid of  $V_3$  returns to ground potential for spacing, the current through  $V_3$  is sufficient to open the contact promptly. Slower armature travel at this time, caused by the stiff spring, is of no consequence. With 0.004-inch armature travel, this method of relay operation results in practically zero variation in the mark/space ratio to, fantastic as it may sound, well above 100 w.p.m.

### Idle Code Generator

$V_5V_6$  and  $V_7V_8$  are cathode-coupled triggers, with  $V_6$  and  $V_7$  conducting in the idle condition. Voltages of +15 and +12 stand on  $R_7$  and  $R_{15}$ , respectively. When the output is to remain spacing, both sequencors,  $V_{10}$  and  $V_{11}$ , are cut off, with cathodes held at +1.7 and +.9 by  $R_{22}$  and  $R_{23}$ , to compensate for the negative contact potentials in the control claspers  $D_1$ ,  $D_2$  and  $V_4$ . Positive pulses from  $C_2R_4$  are clamped at +.9 to the grid of  $V_8$  by  $D_2$  and  $R_{16}$ . The junction of  $R_{10}$  and  $R_{11}$  holds the grid of  $V_4$  at its cathode potential of +1.7, clamping positive pulses to the grid of  $V_5$  at +2.2 volts. These pulse amplitudes are too low to affect the triggers. Negative pulses are not affected by the dot control  $V_4R_6$ , but are grounded out by  $D_1R_{16}$ .

### Dot Generation

When the output is to be a dot,  $V_{10}$  is made conductive by SMS action, establishing +10 volts at  $R_{24}$ . This effectively cuts off  $V_4$ , whose grid does not rise above +8 volts at  $R_{10}R_{11}$ . The first succeeding positive pulse from  $C_2R_4$  rises to +10 volts at the grid of  $V_5$  to transfer conduction to that tube. The resultant drop across  $R_8$  transmits a 60-volt negative pulse toward the grid of  $V_7$  via  $C_4$  and  $R_9$ . This cuts off  $V_7$  and transfers conduction to  $V_8$ . The junction  $R_{12}R_{13}$  stabilizes at -15 volts to cut off  $V_3$ , releasing the relay for marking output.

The following negative pulse cuts off  $V_5$  and returns conduction to  $V_6$ . As  $V_5$  cuts off, a positive pulse is transmitted via  $C_4$  to the grid of  $V_7$ , to return conduction to that tube. The junction of  $R_{12}$  and  $R_{13}$  returns to ground potential, and  $V_3$  pulls up the relay for spacing output.

Even if the key is held closed, with a constant +10 volts standing on  $R_{24}$ , the output cannot again go to marking until the next positive timing pulse, ensuring a full half cycle of spacing output to complete the dot.

### Dash Generation

When the output is to be a dash,  $V_{11}$  is made conductive by SMS action, and +10 volts

\*2296 West Nicolet, Banning, Calif.

stands on  $R_{25}$ . The first positive pulse from  $C_2R_4$  rises to +10 volts at the grid of  $V_8$ , transferring conduction from  $V_7$  to  $V_8$  and the output to marking. The following negative pulse toward the grid of  $V_8$  is grounded by  $D_1$ , and  $V_8$  remains conductive.

Conduction in  $V_8$  reduces the potential at  $R_{15}$  to +2.2 volts. The voltage at the junction of  $R_{10}$  and  $R_{11}$  drops to -0.5 to cut off  $V_4$ , whose cathode now stands at +0.9 volts. (The cut-off voltage is low because the plate voltage is only about 10 volts.)  $C_5R_{14}$  delays this drop until well after the first positive pulse has decayed at the grid of  $V_5$ . The second positive pulse can now trip  $V_5V_6$  to  $V_5$  conduction.  $V_3$  continues to conduct, of course. The second negative pulse cuts off  $V_5$ , which returns conduction to  $V_7$  and the output to spacing. The output cannot again go to marking until the next positive pulse, ensuring the half cycle of spacing to complete the dash after  $1\frac{1}{2}$  cycles of marking output.

When conduction is first transferred from  $V_7$  to  $V_8$ , a 19-volt negative pulse is transmitted from the grid of  $V_7$  toward the plate of  $V_5$  via  $C_4$ , but  $R_9$  limits it to insufficient amplitude to upset stable conduction in  $V_6$ . If SMS action has transferred sequencor conduction to  $V_{11}$  by the time of the second positive pulse in the dash, the elevation of the cathode of  $V_4$  is only incidental, since the drop at  $R_{10}R_{11}$  has already cut off  $V_4$ .

### Automatic Spacing Characters

As in the relay model, interletter and interword spacing characters are obtained by allowing one or two positive pulses to go by. Closure of a key at any time following a passed-up positive pulse produces marking output beginning at the next positive pulse.

### Memory Actuation

The dot-memory trigger  $V_{13}V_{14}$  idles with  $V_{13}$  conducting. This is the opposite tube of the pair from that in the code generators, facilitating the use of readily-derived positive memory-clearance pulses and a simple sequencing structure. While idle,  $C_{12}$  discharges and  $C_{13}$  charges through  $R_{31}$ . Closure of the dot key lifts the grid of  $V_{14}$  on charging current to  $C_{12}$  to the +10-volt value standing at  $R_{37}R_{38}$ .  $C_{13}$  discharges immediately and ensures  $C_{12}$  action despite a possibly scratchy contact at the key. The comparatively slow (2 millisecond) charge rate of  $C_{13}$  through  $R_{31}$  prevents unwanted memory actuation from contact scratch as the key is released. The grid of  $V_{14}$  rises from -13 volts and stabilizes at +10 volts with  $V_{14}$  conducting. The key may be immediately opened and the dot selection will be stored in the actuated trigger until cleared by appearance of the dot at the output.

### Memory Clearance

The dot memory is cleared under control of  $D_3R_{34}$  by a positive pulse to the grid of  $V_{13}$ ,

generated by  $C_{11}R_{36}$  from the  $V_3$  plate swing as the output goes to marking. To prevent spurious memory retrip,  $D_7$  grounds the negative pulse generated as the output goes to spacing.

Only one sequencor tube can conduct at a time. If the output character following the time of dot storage is to be a previously-selected dash,  $V_{11}$  conducts and only +1.7 volts stands at  $R_{24}$ . The clearance pulse toward the dot memory is clamped to that amplitude by  $D_3R_{34}$ , insufficient to clear the memory. When  $V_{10}$  is conductive for dot output, the pulse is allowed to rise to +10 volts at the grid of  $V_{13}$  and return conduction to  $V_{13}$  to clear the memory. The dash memory  $V_{15}V_{16}$  behaves identically, with clearance under the control of  $V_{11}D_6R_{35}$ .

### Sequence Interlock

When the dot memory is idle and the dot key is open, the junction of  $R_{30}$  and  $R_{32}$  applies -13 volts to the grid of  $V_{10}$ , via  $R_{21}$  and  $R_{31}$ , to cut off the tube. Tripping of the dot memory applies +10 volts from  $R_{30}R_{32}$  toward the grid of  $V_{10}$ . If  $V_{11}$  is being held conductive by a positive selection potential from the dash memory or key, its plate current through  $R_{13}$  lowers the potential at  $R_{19}R_{20}$  to -7 volts. The positive potential directed toward the grid of  $V_{10}$  by a dot selected under this condition is clamped by  $D_3R_{21}$ , and the grid of  $V_{10}$  is held below cut-off. This guarantees prior transmission of an earlier selected dash.  $C_7$  stabilizes the negative interlock voltage against spurious releases by plate voltage fluctuations caused by line-voltage changes and distributed capacitive couplings. This is necessary at very low line voltages, where the interlock potential drops to around -3 volts.

With the dash memory clear and the dash key open,  $V_{11}$  is cut off by -13 volts at  $R_{33}R_{40}$ , and  $R_{19}R_{20}$  stands at +12 volts. This allows the +10-volt dot selection potential to reach the grid of  $V_{10}$  via  $R_{21}$ . The cathode of  $V_{10}$  rises to +10 volts to start a dot on the next positive time-base pulse, and permits the memory clearance pulse to reach the grid of  $V_{13}$ . Conduction through  $V_{10}$  and  $R_{27}$  lowers  $R_{28}R_{29}$  to -7 volts, to clamp at  $D_4R_{26}$  any subsequently selected dash until after the dot starts. Additionally, by thus locking out  $V_{11}$  and holding  $R_{25}$  and the cathode of  $D_6$  at +0.9 volts, clearance of the dash memory (when actuated after dot storage but before that dot starts) is prevented.

For a series of dots, the key is held closed and +10 volts from  $R_{37}R_{38}$  holds  $V_{10}$  conductive via  $R_{21}$  (and  $V_{11}$  locked-out) after the dot memory clears at the start of the first dot, until the key is released or the sequencor is "seized" by subsequent actuation of the dash memory. The similar structure of the dash sequencor behaves identically under interlock control of the dot sequencor, to provide single or multiple dashes.

### Sequence Transfer

Assume a dot and a dash, selected in that order before any output starts, and the keys

## The Sonar CD-2 Transmitter-Receiver

As its name implies, the Sonar CD-2 was designed especially for civil defense radio service. As one of the few v.h.f. amateur-band pieces of gear presently approved by the Federal Civil Defense Administration for matching funds, it is of more than ordinary interest. To qualify for FCDA approval, v.h.f. equipment must comply with fairly stiff specifications as to frequency stability and selectivity.

Achieving the required stability in the transmitter was probably no great problem; crystal control and reasonable care in mechanical and electrical design take care of that. But adequate selectivity in a 2-meter receiver runs to some appreciable complication, and when selectivity is achieved, oscillator instability is likely to be something of a headache. A glance at the block diagram, Fig. 1, will show how these matters are handled in the CD-2.

The receiver uses ten tubes. The front end has a 6BK7 series caseode, for low noise figure, followed by a 6AK5 pentode. Self-tuned coupled circuits are used between the second half of the caseode and the 6AK5 grid, and between the 6AK5 plate and the first mixer. Coupling between these circuits is adjusted to give the desired flat response across the band, and the series of circuits gives reasonably high attenuation of signals outside that band. Oscillator stability is assured through the use of a voltage-regulated oscillator-doubler arrangement, with a self-tuned circuit in the doubler plate lead, and very light coupling between the oscillator and doubler.

Output from the first mixer is at 10.7 Mc., and there is one stage of i.f. amplification at this frequency. Then follows a 6U8 mixer-oscillator,

The Sonar CD-2 transmitter-receiver case is designed especially for civil defense station needs. The drop front has a plywood insert to make a writing surface. Space for log, message blanks, microphone cables and other accessories is provided, and the cover and front lock together to prevent unauthorized use.

the latter crystal-controlled, converting to 455 kc. Two stages of i.f. at 455 kc. work into a conventional diode-triode combination that performs the functions of detection, a.v.c., noise limiting and audio amplification. The receiver ends up in a 6AQ5 power audio stage, where a choice of speaker, 'phones-with-speaker, or 'phones alone is afforded.

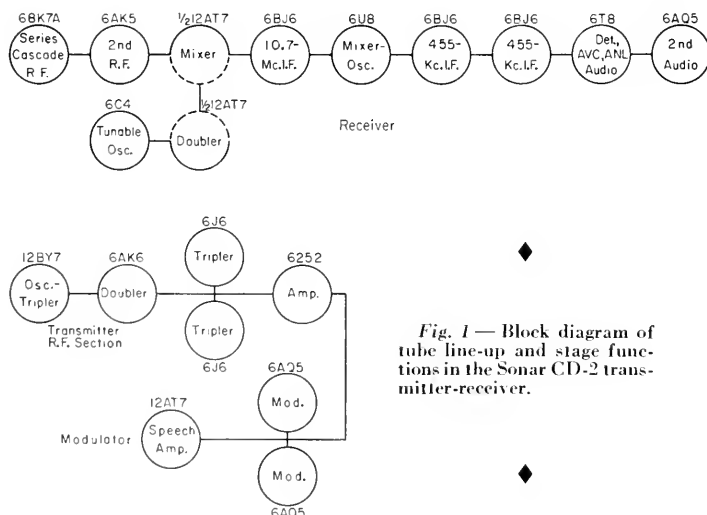

Fig. 1 — Block diagram of tube line-up and stage functions in the Sonar CD-2 transmitter-receiver.

The transmitter line-up consists of a 12BY7 crystal oscillator-tripler, using 8-Mc. crystals, a 6AK6 doubler, a pair of 6J6s in push-pull-parallel tripling, and a 6252 as a straight-through amplifier on 144 Mc. Inductively-coupled double-tuned circuits are used in the last three stages to provide essentially flat response across the band and good attenuation of unwanted oscillator-multiplier frequencies. The rated

Interior of the CD-2. Transmitter components are at the left; receiver and power supply on the right.

output of 17 watts seems quite conservative and is readily developed.

Modulation is supplied by a pair of 6AQ5s, driven by a 12AT7. A Type F1 carbon button microphone is used, and there is provision for either push-to-talk or toggle-switch control of the send-receive operation. A small amount of r.f. output is coupled off at the antenna connection to an r.f. voltmeter to provide for tuning up. Indication of transmitter tuning is shown on a meter, which doubles as a tuning meter for reception, and in addition there is a red jewel light that indicates both output and modulation. The circuit used for these purposes is reproduced in Fig. 2.

### *Tuning & Adjustment*

In keeping with its intended service, the CD-2 is designed so that a minimum of adjustment is required in normal operation. Alignment adjustments of both transmitter and receiver are preset, and should not require adjustment except in case of parts failure or other damage. In the case of the receiver,

the operator merely turns the calibrated dial, and adjusts the audio level to suit conditions. Maximum downward swing of the meter indicates proper tuning of a signal.

The transmitter has provision for eight crystal-controlled channels, selection being made with a single front-panel switch. The only tuning adjustments are the final plate tank and the antenna series-tuning capacitors. A front-panel "calibrate" switch applies screen voltage to the crystal oscillator, when the station is in the

Bottom view of the Sonar transmitter-receiver. Receiver and power supply occupy the large section.

"receive" position, to permit checking the operating frequencies and the receiver calibration against each other. The harmonic from the crystal oscillator in the 144-Mc. band is strong enough to make an appreciable dip show on the tuning meter as the receiver is tuned across the operating frequency.

The CD-2 housing and accessories are designed for its rôle as a civil defense control station.

Fig. 2 — Tuning indicator circuit used for checking transmitter adjustments in the CD-2. In the complete circuit, the meter is also switched to indicate strength of the received signal.

The drop front and hinged top lock together with a cut key, so that unauthorized use can be prevented. The bottom portion of the case has ample space for log, message blanks, spare cables and other small accessories. The front cover has a large plywood insert, to provide a writing surface for field use. The cover can also be removed readily, to save space in a permanent installation. Carrying handles are provided on the sides of the case. The shelf on which the

chassis rests is copper plated, to provide good contact with the chassis, and it is made of expanded metal for full ventilation. The front panel has a shaded desk light that can be turned on or off by a toggle switch.

The power supply works on either 6-volt d.c. or 115-volt a.c. input, separate cables being plugged into a single receptacle on the rear wall of the chassis. The socket is reached through a hinged door in the back of the cabinet. Selenium rectifiers are used, this being the first instance we've seen where they have been applied to amateur gear of this power rating. The result should be superior regulation, and an appreciable saving in drain when the rig is run from a 6-volt source. An operating check of the unit showed the total drain from a 6-volt storage battery to be 20 amperes on receiving and 33 on transmitting. Extended use with storage-battery power should not be attempted unless a satisfactory means of charging is at hand, as output drops rapidly after the first 5 minutes of use from a fully-charged battery.

The manufacturer supplies the CD-series gear for any 4.5-megacycle segment of the spectrum from 50 to 180 Mc., so a CD-6 is also available for use in the amateur 50-Mc. band. Both amateur band units may be expected to find considerable acceptance in areas where c.d. planning is well organized, and supported by local or state-wide governmental agencies. — E. P. T.

## The Gonset 6-Meter Communicator

**I**F lack of suitable ready-made gear has been a factor in the present rather low state of activity on the 6-meter band, here's a complete package that should go a long way toward injecting new life into what could be one of our most interesting slices of the r.f. spectrum. Certainly the 2-Meter Communicator has become one of the most familiar features of the v.h.f. scene. This has come about because it combines in one small convenient unit many features that make for pleasant and effective 2-meter work.

The new 6-meter model is physically an almost

exact duplicate of the popular 2-meter job. It is built, insofar as possible, around the same components and subassemblies that are used in the 2-meter rig, and it has the same useful gadgets. These include a tuning eye that works on both transmitter and receiver; a crystal spotter, for checking transmitter frequency and receiver calibration; an adjustable squelch, for quieting the receiver during stand-by periods; universal power supply, for both mobile and home-station use; the option of either carbon or crystal microphone input; provision for use of the audio system

The double-conversion receiver unit, left, and combined transmitter and audio system, right, are little more than good-sized handfuls.

The 6-Meter Communicator by Gonset is physically an exact duplicate of its 2-meter counterpart. Individual adjustment of all transmitter stages is made through holes in upper left side of the front panel, proper setting being indicated by closure of the tuning eye. Receiver has squelch-level, volume and noise-limiter controls, lower left.

for public-address work; and many other features.

In addition, there are innovations that help the 6-Meter Communicator cope with conditions different in several respects from those encountered in 2-meter operation. The receiver is a double-conversion job, providing considerably better selectivity than the single-conversion 6-Mc. i.f. in the 2-meter receiver. The tuning range is extended one megacycle below the edge of the band, permitting monitoring of the mobile services in the 49-Mc. region for signs of band openings. Enough use of these frequencies is made in most parts of the country so that something will be heard almost any time that sporadic-*E* or *F*<sub>2</sub>-layer skip is present. There is a built-in low-pass filter, connected permanently in the antenna lead, to reduce harmonics from the transmitter and spurious responses in the receiver.

For obvious manufacturing reasons, the transmitter has the same tube line-up as the 2-meter one, but there is one less multiplier stage. A 6CL6 crystal oscillator-multiplier, with either 8- or 12-Mc. crystals, drives a 12AV7 parallel doubler to 50 Mc. The final stage is a 2E26, delivering an output of about 6 watts. (We measured better than 6 watts with a Micromatch into a matched load.) The modulator has a 12AX7 amplifier working into a 6V6GT. This also serves as the receiver audio system.

The receiver front end has a 6BQ7A cascode r.f. amplifier and a 12AT7 mixer-oscillator, with 11-Mc. output. The receiver oscillator is on the high side, so there is no problem with 28-Mc. images. Mixer output is 11 Mc., and there is one stage of i.f. amplification, a 6BH6, at this frequency. Then follows a 6BE6 converter to 1500 kc., and a 6BJ6 i.f. amplifier. The functions of detector, noise limiter, a.v.c. rectifier and first audio amplifier are combined in a 6TS, which feeds the audio system. A subminiature 6BG7 dual triode handles the squelch. Our noise generator shows that the noise figure of the 6-Meter Communicator is better than is required for good weak-signal reception.

The power supply is identical to the 2-meter unit, having two 6X4 rectifiers, and provision for either 6-volt d.c. or 115-volt a.c. input. Connections for these two types of operation are made by separate cables supplied with the unit.

A variation from the 2-Meter Communicator is seen in the antenna furnished. The 19-inch whip is replaced by a polyethylene-insulated half-wave Zepp that can be rolled up and carried in a pocket. The quarter-wave whip idea is less effective with the 6-meter rig, as there is insufficient metallic mass in the cabinet to serve as a ground-plane at this lower frequency. The manufacturer also offers 6-Meter yagi antennas that can be used individually or in stacked pairs.

Cabinet appearance, power supply and audio system are identical to the 2-Meter Communicator. The 6-meter model is supplied for either 6- or 12-volt operation. — E. P. T.

Bottom views of the receiver and transmitter used in the 6-Meter Communicator. Outboard unit on back of receiver is cascode r.f. amplifier. Receiver and transmitter use common audio system.

# Happenings of the Month

## BOARD MEETING

In May the Board of Directors of the American Radio Relay League will meet to examine the record for 1954, and to come to decisions charting a continuing course for the future. The director of your division is *your* voice in League affairs. Communicate to him your views on matters of the day so that he may be informed, as is required of him in the By-Laws, "as to conditions and activities in his territorial division and as to the needs and desires of the members therein in order that he may faithfully and intelligently represent the true interests of such members."

## TECHNICIANS GET 50 MC.

In mid-March FCC released its decision in Docket No. 11157, dealing with Technician Class privileges: the 50-54 Mc. band is opened to that class of license effective April 12th; FCC dismissed its proposal to open also the 144-Mc. band to Technicians. The text of the order follows:

1. As a result of its consideration of petitions for rule making filed by James M. Price and Tom A. Walker, the Commission adopted the Notice of Proposed Rule Making in this proceeding, and it was published in the Federal Register on September 11, 1954, 19 FR 5917. The Notice proposed amendment of Section 12.23(d) to permit operation by Technician Class amateur operators in all amateur frequency bands above 50 Mc. which would have the effect of adding the 50-54 Mc. and the 144-148 Mc. bands to the privileges presently available to the Technician Class licensee. The petitions of Messrs. Price and Walker proposed addition only of the 50-54 Mc. band to the existing privileges for the Technician Class operator.

2. Comment on the proposed amendment was submitted by some 18 amateur organizations and over 125 amateurs individually. In regard to the 50-Mc. band, there appears to be substantial expression of approval of provision for Technician Class operator privileges therein.

3. As evidenced by the comment received, there appears to be considerable controversy as to whether technicians

should be allowed to operate in the 144 Mc. band. Because of the opposition expressed by the American Radio Relay League, and because it does not find the arguments expressed in the comments otherwise decisive, the Commission is hereby dismissing that portion of the proposed amendment having to do with technician privileges in the 144 Mc. amateur frequency band.

4. This amendment is issued pursuant to authority contained in Sections 4(i) and 303(f), (g), and (r) of the Communications Act of 1934, as amended. IT IS ORDERED, That effective 3:00 a.m., EST, April 12, 1955, Section 12.23(d) of Part 12, Rules Governing Amateur Radio Service, IS AMENDED as set forth in the attached Appendix.

FEDERAL COMMUNICATIONS COMMISSION  
*Mary Jane Morris*  
Secretary

Adopted: March 9, 1955

Released: March 10, 1955

## APPENDIX

SECTION 12.23(d) OF PART 12, RULES GOVERNING AMATEUR RADIO SERVICE, IS AMENDED AS FOLLOWS:

(d) Technician Class. All authorized amateur privileges in the amateur frequency band 50-to-54 Mc. and in the amateur frequency bands above 220 Mc.

## QST ARTICLE AWARDS

The Executive Committee has announced its selection of three outstanding articles which appeared in *QST* during 1954, and awarded the authors cash prizes of \$300, \$200 and \$100. Single-sideband, as might be expected from its rapid development in 1954, was the subject for the No. 1 spot — the judges were unanimous in making the first award to Warren B. Bruene, W0TTK, for his November article, "Distortion in Single-Sideband Linear Amplifiers." A special, and hitherto untreated, phase of TVI ran a close second — the next award was to F. E. Ladd, W2IDZ, for his two-part article in June and July,

On March 19th, 200 VEs representing all of Canada met in Montreal to honor Canadian Director Alex Reid, VE2BE, who on December 31, 1954, became the first director to complete 25 years of continuous service on the ARRL Board of Directors. Amateurs from all parts of Canada joined to present Alex with a single-sideband exciter unit and accessory gear, as a token of appreciation. Here (*l. to r.*) are: ARRL General Manager Budlong, WIBUD; Mrs. Gordon Lynn; Director Reid; Mrs. Reid; ARRL President Dosland, W0TSN.

"50 Mc. TVI — Its Causes and Cures." Antennas, as last year, provided the third subject — the award going to William B. Wrigley, W4UCW, for his February article "Impedance Characteristics of Harmonic Antennas."

### CHAMBERS' 25TH

On March 6th, C. Vernon Chambers, *QST* Technical Assistant, became the seventh member of the present ARRL Hq. staff to reach the 25-year mark.

"Vern" came to Hq. as an office boy, but the inevitable happened — the bug bit, and he shortly became W1JEQ. His interest and development ability made him a logical candidate for

W1JEQ

lab work, and he turned out a number of pieces of gear for *QST*, with special attention to low-power equipment for the beginner. He was associated with Ross Hull in the development of u.h.f. gear for the *Handbook* and carried that work to completion after Hull's untimely death. Vern then took over the ARRL Technical Information Service until World War II interrupted with both Army and civilian service in the field of guided missiles.

Chambers' postwar projects for both *QST* and the *Handbook* have included a goodly number of items at beginner level, but have ranged into many other fields as well — mobile gear, development of high-power r.f. chokes, and all sorts of general transmitting designs. His bandswitching rig in January 1954 *QST* brought more response from amateurs than perhaps any other article postwar.

When we use on Vern the old saw, "The second 25 years are the hardest," it isn't really funny: he has that much longer to go before reaching retirement age!

### OPERATION IN GREENLAND

For some months negotiations have been in process for the authorization of amateur operation in Greenland by U. S. citizens. Permission has now been granted, under an agreement with the Danish government, and the U. S. military

is to issue detailed rules and regulations as well as issue call signs from the block KG1AA through KG1LZ.

### NOVICE TALKING BOOK

The Division for the Blind, Library of Congress, through the facilities of the American Foundation for the Blind, has produced a new Talking Book, "The Radio Amateur's Novice Examination, Questions and Answers." Excised from ARRL publications, and with code practice material especially written and taped by Hq., the package consists of eight 12-inch record sides. It is available to qualified blind readers through the 28 regional libraries in the usual manner (see list page 30, January 1953 *QST*). Thomas B. Hedges, W3QQS, assistant chief of the Division, contemplates expanding the Talking Book program to higher grades of amateur license if interest warrants.

### A.R.R.L. QSL BUREAU

The function of the ARRL QSL Bureau system is to facilitate delivery to amateurs in the United States, its possessions, and Canada of those QSL cards which arrive from amateur stations in other parts of the world. All you have to do is send your QSL manager (see list below) a stamped self-addressed envelope about 4 1/4 by 9 1/2 inches in size, with your name and address in the usual place on the front of the envelope and your call printed in capital letters in the upper left-hand corner. (Bold-face type indicates change since last *QST* listing.)

- W1, K1 — J. R. Baker, jr., W1JOJ, Box 232, Ipswich, Mass.
- W2, K2 — H. W. Yahnel, W2SN, Lake Ave., Helmetta, N. J.
- W3, K3 — Jesse Bieberman, W3KT, Box 34, Philadelphia 5, Penna.
- W4, K4 — Thomas M. Moss, W4HYW, Box 644, Municipal Airport Branch, Atlanta, Ga.
- W5, K5 — Oren B. Gambill, W5WI, 2514 N. Garrison, Tulsa 6, Okla.
- W6, K6 — Horace R. Greer, W6TI, 414 Fairmount St., Oakland, Calif.
- W7, K7 — Mary Ann Tatro, W7FWR, 513 N. Central, Olympia, Wash.
- W8, K8 — Walter E. Musgrave, W8NGW, 1294 E. 188th St., Cleveland 10, Ohio.
- W9, K9 — John F. Schneider, W9CFT, 311 W. Ross Ave., Wausau, Wisc.
- W0, K0 — Alva A. Smith, W0DMA, 238 East Main St., Caledonia, Minn.
- VE1 — L. J. Fader, VE1FQ, 125 Henry St., Halifax, N. S.
- VE2 — Harry J. Mabson, VE2APH, 122 Regent Ave., Beaconsfield West, Que.
- VE3 — W. Bert Knowles, VE3QB, Lanark, Ont.
- VE4 — Len Cuff, VE4LC, 286 Rutland St., St. James, Man.
- VE5 — Fred Ward, VE5OP, 899 Connaught Ave., Moose Jaw, Sask.
- VE6 — W. R. Savage, VE6EO, 329 15th St., North Lethbridge, Alta.
- VE7 — H. R. Hough, VE7HR, 2316 Trent St., Victoria, B. C.
- VE8 — W. L. Geary, VE8AW, Box 534, Whitehorse, Y. T.
- VO — Ernest Ash, VO1A, P. O. Box 8, St. John's, Newfoundland.
- KP4 — E. W. Mayer, KP4KD, Box 1061, San Juan, P. R.
- K1H6 — Andy H. Fuchikami, K1H6BA, 2543 Namaau Dr., Honolulu, T. H.
- KL7 — Box 73, Douglas, Alaska.
- KZ5 — Gilbert C. Foster, KZ5GF, Box 407, Balboa, C. Z.

# 21st ARRL Sweepstakes Results

## Part I—C.W.

BY PHIL SIMMONS, W1ZDP

SAYS W5VNW: "Thanks for 40 hours of solid enjoyment. As the operator of a fixed, low-power station, the Sweepstakes is my choice of all the contests." Says W1UTA: "I like the SS because it offers good practice in operating procedure, the thrill of raising new sections, an opportunity to learn how the rig really performs, but best of all, the chance to study the personality of a good cross-section of Hamdom. I have observed with a grin the leisurely fellow whose clock is five minutes slow, the hurry-hurry boy who doesn't wait for a 'roger,' and the operator who CQs 15 times before you find you've already worked him." Says W0BUR: "I like the absence of the cut-throat dog-eat-dog competition that marks some other contests." Says W4CVM: "Conditions were about as near perfect as I can remember them. There seemed to be more of the 'old ham spirit' this year, and all of the regulars were on hand: W3BES, W4HA, W9IOP, W1FTX, W4KFC, W4CIU and many others." Says W8APC: "Judging from the serial numbers

Jack Bryant, W5TFB, was stricken by SS-itis at an early age. Now 17, Jack already has stacked three consecutive North Texas wins, was tenth high nationally and top W5 in the '54 doings.

being sent the second week end, the entire population of the state of Connecticut will be needed to check the logs!"

The foregoing colorful contestimonials show why 1796 entrants (1394 c.w.) enjoyed themselves immensely (and why contest-checker W1CUT, ex-W5TQD, almost went back to Texas). They indicate, too, why the 1954 SS

moves into the record books as the biggest ever held, dwarfing previous highs registered in 1939 and 1953. Gripping about contest rules and poor conditions was all but nonexistent as scores rocketed to adding-machine proportions and 84 hard-working section and Novice winners earned certificates for brasspounding.

We're pleased to revive a popular prewar SS feature which listed, among other items, the equipment and bands of the section leaders. Aided by some fast slip-stick fumbling, one finds that there is real thought-food here; e.g.:

1) About 85 per cent of the 72 section winners utilized the trusted 20–40–80-meter band combination (although five of them scooped up extra credits on 15 meters).

2) Seventy-seven per cent fell in the 100-watts-or-less category, while the rest ran high power.

3) The *average* winner racked up 590 contacts in 66.6 sections for 97,450 points, was active 35 hours with 175 watts input.

4) Low-power champ was 25-watt Oklahoman W5WZV.

5) One-band champ was South Texan W5WQN with 704 QSOs on 7 Mc.

The set-ups in the tabulation typify the "new look" in SS circles, as compared with the May, 1940 *QST* version, which recorded such bottles as

◆  
Md.-Del.-D.C. leader W3JTK settled for 180,540 points, ranked fifth amongst the 1394 c.w. entrants with a 100 per cent home-brew rig. The gadget at the upper right, a photoelectric-keyed CQ SS wheel, gave a good account of itself, Jack reports.

**QST for**

860s, T-40s, HK-254s and 211s in vogue in those days. (And you just can't hardly get them no more!) Rifle through your old-time *QST*s and see for yourself what the previous generation of SS enthusiasts worked with.

Now here's a foursome that knows the business

by heart! Each sends code reminiscent of a W1AW Qualifying Run and sports a clean, ether-wrenching signal. Each salted away over 1100 contacts and attained, for the first time in SS annals, a final score in excess of 200,000 points. Congratulations are in order, then, to W4KVX

for his all-time record-smashing 209,353-point tally, and to W9IOP, W4KFC and W7KVU for their totals of 208,506, 203,850 and 202,210, respectively.

And for their savvy and downright stick-to-it-iveness, plaudits and salaams to these others who broke 125,000: W3JTK 180,540, W7KEV 168,448, W3EIS 165,638, W9ERU 157,230, W9YFV 154,030, W5TFB 152,479, W3GHM 147,502, W8LQA 146,213, W3FRY<sup>1</sup> 145,726, W8BTI 144,540, W9RQM 143,080, W6EPZ 142,076, W5KC 141,468, W3AEL 140,875, W0YCR 139,650, W3JBC 134,502, K6BLI<sup>1</sup> 133,590, W2SSC 133,175, W0TKX 133,043, W3CTJ 132,313, W0NWX 131,850, W9NPC 131,823, W3BES 130,488, W3GRF 130,315, K6CEF 130,123, W4PNK 129,634, W9PNE 129,330, W3JTC 128,845, W6HOC 127,294, W5QNZ 126,936, W7NLI 126,114, W8EV 125,925.

Section-hunting remains the favorite pastime of a goodly share of the gang, and it's quite an art. Here is the sharp-eared crew that bagged all 73 ARRL sections in '54: W1s EOB JTD ZDP, W2FEB, K2BZT, W3s ADZ ALB BES CTJ FRY JBC JNQ JTC KT, W4s KVN YFA, W5TFB, W6s BIP EPZ HOC MUR PYH ULS UTV YK, K6s BLL CEF, W7s GEB KEV KVV PQE, W8s DUS EV, W9s IOP RQM YFV, W0TKX. Note that all U. S. licensing areas made the grade. Saskatchewan, Yukon/N.W.T. and Idaho would seem to be the toughest; 17 of the 37 experts named one of the three as the last section snagged. But K2BZT, who made the "clean sweep" in just 257 contacts, and ex-W1AW op WIJTD, who did it in 310, are the two who worked the *mostest* with the *leastest*. Choosy W0QDF likewise merits honorable mention for getting 72 out of a mere 74 QSOs.

Heartening indeed are the many friendly new faces that crop up yearly in the special Novice competition which the Sweepstakes affords. When three or more KN/WN people enter logs from a given section, the leader nabs an appropriately-endorsed Novice certificate. The following yearlings earn a burst of applause, and the certificate as well, for graduating *magna cum laude* from their first venture into contest capers: W1s BLD CDD, KN2HXR, WN3ZKH, WN5HIS, KN6EVR, W1s SRK TGB, W1s GBC HAH IGV, WN0SQE. See you in the '55 SS *minus* the "N," fellows!

<sup>1</sup> Multioperator station.

## Sidelights

Lavish antenna systems were brought into play by the 200-grand quartet. W4KVX relied on 280- and 405-foot zepps, a 7-Mc. ground plane, and a 14-Mc. beam; all four were suspended from or mounted on telephone poles. W9IOP found an end-fed 136-foot wire, a 40-meter ground plane, and a 20-meter rotary to his liking; and so did W4KFC, who utilized an identical bunch of skyhooks. Out west, W7KVU made that huge signal even huger with such paraphernalia as (1) for 80 meters, a wire 12 wavelengths long and a half-wave zepp; (2) a 7-Mc. ground plane and zepp; (3) 3-element wide-spaced rotaries for 15 and 20. . . . Lament from multips W3s WIE WIF at close of festivities: "Brother, are we tired." (Boys, you weren't alone!) . . . W8CUP says his FL8A filter saved the day. . . . W2BRC got 43,935 and W2CJM 13,069 points with attic antennas. . . . W2MUM pounded bases for the Order of BO (Boiled Owls). . . . Overheard on 20 the last Sunday: WIJYH

Budding contester Dick Brandt, KN2HXR, E. N. Y. Novice winner, got the most markers registered by a KN/WN in SS competition — over 10,000. For further news of Dick's operating sojourns, see the Novice Round-up results on page 50.

explaining the rules to W1KGH/VE8. After Rog had paved the way, the mob descended. . . . K2ENO broke in a new SX-24 and got 7 additional states. . . . Anchor man for Ohio Valley Amateur Radio Association was 2-watt W8BAE. . . . Those who swapped messages with Iowan W0NWX unwittingly nailed F08AJ/W0. Bob was using the transmitter-inhaler combo of the famous Clipperton DXpedition (July, 1954, QST). . . . W0FVD is positive his code speed improved as a result of struggling with weak sigs in the QRM. . . . In '53 WN1YMA made 34 QSOs, in '54 W1YMA got 741! How's that for improvement! . . . W4LVV found conditions good except for one weird 90-minute spell on 20 meters when it was impossible to raise anyone although incoming signals were strong. . . . W6OAY is confident QSLs will come through from several new states worked. . . . W3BQU/5 landed 23,490 points with a 24-watt transformerless rig. A voltage doubler juiced the p.p. 117L7s in the crystal oscillator circuit. Dimensions: a pocket-sized 4-by-4 inches. . . . KV4BK, ex-7CO (1912), 6RX (1920), and W5RX (1947), enjoyed the "other side of the fence" despite fierce QRM. QRT for 20 years, Charles

## NOVICE C.W. WINNERS, 21st A.R.R.L. SWEEPSTAKES CONTEST

Section	Call	Score	Transmitter	Watts Input	Receiver	Bands Used
Mid.-Del.-D. C.	WN3ZKH	5003	Viking II	75	HR05	80, 40, 15
Illinois	WN9GBC	3250	807s p.a.	70	SX42	80
Indiana	WN9IGV	6695	6AG7-6L6-807	60	NC125	80
Wisconsin	WN9HAH	2640	AT1	35	S76	40
Michigan	WN8SRK	468	AT1	15	SX71	80
Ohio	WN8TGB	3313	AT1	30	NC98	80, 40
E. N. Y.	KN2HXR	10,036	AT1	35	S40B	80
Iowa	WN0SQE	3413	Ranger	65	S7C	80, 40
Connecticut	WN1CDD	3503	Globe Scout	50	S40B	80, 40, 15
E. Mass.	WN1BLD	5740	TB850	50	HQ129X	80
Los Angeles	KN6EVR	8229	Viking II	75	NC173	80, 40
No. Texas	WN5HIS	2719	Lysco 600	50	SX28A	80, 40, 15

returned to top c.w. form rapidly in the SS. . . . Alaskan pace-setter KL7EVR apologizes for his difficult-to-read log transcribed at 16,000 feet during a KL7-to-W7 flight. . . . A 2-tube regen job performed the receiving chores for W6FAR. . . . W4KFC's 1183 stations worked in '53 is still tops. . . . With the same 30-watter he had last year as a Novice, W9YOS was tickled to multiply his score by 3. . . . W4KVX employed a card logging system complete with automatic time stamp and numbering machine to assist in avoiding or nullifying repeat QSOs as they occurred. . . . W8OTK thanks the boys for QRsing for him his first time out. . . . W7PQE got ten KL7s but had to cajole VE5 and K116 non-SSers into swapping preambles. . . . Complete break-in system (March, 1954, QST) — using tubes for antenna-switching and receiver-quieting — worked great at W7GEB. . . . We can thank WIRWP for increased Vermont activity. Stan has been carrying on a feverish one-man campaign to get better representation from that elusive section. . . . W4KMF/7 avows the competition in Arizona is considerably less rugged than it was in Virginia. . . . W5WZV captured his first SS scalp since 'way back in '36 and '37 when he earned Philippine honors as KAIUS. . . . W1WAI snared his 48th state, learned much about when to work which bands. . . . W1IAP used a receiver-controlled VFO on 7 Mc. . . . W9RQM's XYL presented him with a new junior op during the SS. . . . The last 25-cycle power areas were being converted to 60 cycles near VE3ACB and intermittent power leaks held down his score. . . . W4KFC tells a little tale about a newly-recruited Potomac Valley member, W1NQML Sparkie was calling a Vermont when his key actually fell apart, whereupon he scooped up a screwdriver, finished the call with the blade, and landed the Vermont station! . . . "My first SS in 19 years. The last time I entered, as W2BMX, I won for E.N.Y. with two crystals, 152 contacts. Needless to say, I was feeling my way in this one. Just wait 'til next year!" — W4CXA. . . . "What a wonderful time! The SS seems to get better every year. Conditions were the best that I can remember, and operating proficiency and signal quality were better than ever before. Chirps, yoops and clicks were at a low ebb, making operating a distinct pleasure. . . . Some sort of award should be given to the XYLs who are the backbone of a good score. Where would we be without the hot coffee, special meals at off-hours, and plentiful supply of sharp pencils and log sheets. Yes, they deserve a big hand for their help!" — W7KTV. . . . "Surprised to end up with the same number of contacts (199) in 21st as in 20th SS. Also was lucky enough to have Vermont and VE8 reply to my CQ machine." — W6BIP. . . . "Wonderful contest! Found 21 Mc. wide open but nobody there; 14 Mc. best band out here." — W7GEB. . . . "The 20-watt transmitter that gets RST 599 1000 miles away on 3.5-Mc. SS eve, when the customary handful of stations are tuning up for the event, is fairly ineffective in the melee starting at 1800 EST the next day, but 75 to 100 watts does the job FB. You can get the contacts with lower power but you have to work hard and be discouragingly patient. Every year, though, I'm back with more determination than ever." — W8DM. . . . "First contest and it was a barrel of fun." — W8IRO. . . . "My object each year has been to work all sections. Thought I had it this time when a VE8 answered but discovered too late that I had missed Sacramento Valley. Oh well, maybe next year!" — W8ZJM. . . . "Wow, what a battle! Heard the W6s working W1QMM (Vt.) on 20 but couldn't find him. My family is beginning to speak to me again!" — W3LMM. . . . "Gained valuable operating experience and learned how to tune up the rig in a hurry." — W0TLD. . . . "Conditions excellent the first session and almost as good the second. Sections I usually have trouble logging were in abundance, but there seemed to be a dearth of KZ5, VE5 and VE8 participants. This was my twelfth SS." — W0YCR. . . . "Bettered

previous scores made as W3UVB and W8YJE and finally went over 100,000 points. No repeat contacts thanks to my first use of ARRL Operating Aid No. 6." — W4CYV. . . . "My second SS and pleased to better last year's score considerably. A foolproof break-in system is a must!" — VE2CB.

Next month — be the good Lord willing! — we'll bring you a symposium of club and 'phone highlights, including an A3 equipment tabulation and such photographs as we can muster. Di-dah-di-di-di!

## C. W. SCORES

### Twenty-First Sweepstakes Contest

Scores are grouped by Divisions and Sections. . . . The operator of the station first-listed in each Section is award winner for that Section unless otherwise indicated. . . . Likewise the "power factor" used in computing points in each score is indicated by the letter A or B. . . . A indicates power up to and including 100 watts (multiplier of 1.25, c.w.), B over 100 watts (multiplier of D). . . . The total operating time to the nearest hour, when given for each station, is the last figure following the score. . . . Example of listings: W3G1HM 147,502-831-71-A-39, or, final score 117,502, number of stations 831, number of sections 71, power factor of 1.25, total operating time 39 hours. . . . An asterisk denotes Novice certificate winners in sections where at least 3 Novice logs were submitted. . . . Multioperator stations are grouped in order of score following single-operator station listings in each section tabulation, with calls of participants in parentheses.

With this spiffy layout, John Ryan, W7KVU, brought home a blistering 202,210 points and the Montana wallpaper. When he feels like creating additional db. for DX chasing, John uses the B & W 5100 to excite p.p. 4-400As at one kw.

# Results—1955 Novice Round-up

BY ELLEN WHITE, W1YYM

**M**ORE PARTICIPANTS, more operating savvy, and more fun for all personified the Novice Round-up, '55 style. With over 200 WN/KN competing Novices available to QSO, high tallies proved the rule, not the exception. After all, "... There is certainly no lack of operating ability on the part of the WNs. In most cases, excellent technique and a knowledge of operating procedure equal to that of the higher classes were exhibited." — W5VNV

After a quick look-see at how you placed in your section, you may wish to compare your score with the following call-area leaders. In this summary, only contact and section totals are given; full details may be found in the complete tabulation.

WN1CKA 180-45	KN6EVR 110-13
KN2HXR 219-42	WN7YAO 126-50
WN3ZKH 245-47	WN8SYZ 140-40
WN4FRO 139-47	WN9GWS 185-44
WN5FJN 173-61	WN0VKI 295-55

Two of the tougher states to acquire while working for WAS are Utah and Rhode Island. Not so in the NR! On our left, representing Rhode Island, WN1BIS supplied a multiplier for 134, while WN7WSS from the Beehive State (Utah) was a choice one for 115. In the words of KN6HAN, "The contest brought out a lot of the rarer ones!"

## Sidelights

From down Virginia way, W4YZC reports some of the best signals emanating from WN1ACD, KN2HXR, WN3ZKN, KN4ASU/4, WN8SWB, WN9GWS and WN9GBC. From the West Coast, San Joaquin Valley leader KN6HFA reports outstanding signals from W1MX, WN0VKI, KN4ANW, WN5FJN, W4VRT and W1WPO.

Giving testimony to sharp ears for faraway sections, the following licensees racked up 45 or more of those juicy multipliers. In descending order are eight star performers: WN5FJN, WN0VKI, WN7YAO, WN9GBC, WN7WSS, WN3ZKH, WN4FRO and WN1CKA. Not only

<sup>1</sup> W1QIS, W1WPR, W1YYM ops. <sup>2</sup> W1YFM, W4YHD, W5ZID ops. <sup>3</sup> W0IIAW, opr.

that, but "during the contest I worked my first ZL and an XE" reports WN1CKA.

"After having taken part in two SS contests, I believe that the NR is about four times as difficult a test of operating ability." — W1SSZ. Yet, in spite of QRM, QRP, QSB and homework, twelve of the boys came through with 150 or more QSOs. Well-earned plaudits to WN1CKA, KN2HXR, KN2ICU, KN2JKC, WN3AML, WN3ZKH, WN4GFT, WN5FJN, WN9GWS, WN9HFB, WN9ICE and WN0VKI.

## Round-up Remarks

"My copying has improved; the NR helped me recognize numbers at faster speeds." — KN2JGU. . . . "Between the kitchen, the store, the 'phone and the neighbors I managed to get in 35 hours of operating time. Had good technical

"I'D LIKE TO CATCH UP WITH THE GUY THAT GAVE ME THE FLU ON THE NEXT TO THE LAST NIGHT OF THE CONTEST."

advice from OM W7HMQ. Bring on the Field Day." — WN7WHV. . . . "My ears are still red after being broken in by a brand-new set of headphones." — WN9ILE. . . . "Found some snappy operators for future FD and SS contests." — W5OMK. . . . "That WN1AND — what a beautiful fist!" — W1VNX. . . . "FB 60% QSL percentage." — W1AW. . . . Our nominee for the neatest log keeper (indicating 35-v.p.m. certification): KN4ASU/4.

## Non-Novice High Scorers

Again this year, many non-Novice stations supplied a helping hand. Calls shown in bold-face are those of last year's participating WN/KN operators, returning in '55 to help the new licensees. The following scores are shown in alphabetical order. W1AW 3321,<sup>1</sup> W1BDI 720, W1CDD 1218, W1GKJ 900, W1JYH 3132,

Equipment of aid to WN7WHV (Puyallup, Wash.) in acquiring 162 QSOs in 41 sections consists of a Lyco 600 for 21 Mc. topped by a Communicator for monitoring the Pierce County c.d. frequency, a Ranger for 40 and 80 (beneath the RME 23 preselector), and an HRO-50 with Selectoject. Alice collects elephants too!

(Continued on page 140)

During the first week of the contest, WN0VKI paused to rebuild his 5763-4D32 rig. Result? Seventy-five watts and fine operating ability (plus an HRO-60) garnered 295 QSOs for Dick! This contest leader from Omaha worked 47 of the 48 states in his first 4 months on the air. Vermont is still the elusive 48th.

May 1955

## HAMFEST CALENDAR

**ALABAMA** — The Birmingham Amateur Radio Club will hold its annual Hamfest at the State Fair Grounds, Birmingham, Sunday, May 15th. For further information and tickets write P. O. Box 603, Birmingham, Ala.

**GEORGIA** — The Atlanta Radio Club hamfest will be held May 28th-29th. The place for the Saturday night Dutch supper is Joe's Steak House on the four-lane highway near Marietta. Guests will be accommodated at the Marietta Motel and other motels nearby. The Sunday hamfest will be at Robertson's Tropical Gardens on West Paces Ferry Road at the *Chattahoochee River*. Barbecue chicken will be served, and refreshments will be available. Tickets are \$3.00. Tickets and motel accommodations may be handled through Jack Farr, W4TJS, 572 Wells Ave., Hapeville, Ga., or Tom Moss, W411YW, 1009 Connally Drive, East Point, Ga.

**INDIANA** — Clifty Falls picnic, sponsored by the Madison Amateur Radio Club, will be held at Poplar Grove, Clifty Falls State Park, Madison, on Sunday, May 15th, 10 A.M. to 4 P.M. No registration fee; the only cost is a 10 cent charge for admission to the state park. This is a family affair, so load up the lunch basket, XYL and the kids for a big time. Only a short drive from Cincinnati, Louisville or Indianapolis. Plenty of shelter, so come rain or shine. For further information contact W9QOT, R.F.D. No. 6, Madison, Ind.

**ILLINOIS** — Sunday, May 22nd, Fourth Annual Mississippi Valley Hamfest at Rock Island County Conservation Grounds on Big Island, Milan. There is a new road along the Canal fellows so the going will be smooth. There will be plenty of good food and fun for all. Advance registration tickets are \$1.25 or \$1.75 at the gate. For advance registrations write Harry Studer, W9RYU, R.R. No. 1, Milan, Ill.

**ILLINOIS** — Starved Rock Radio Club Hamfest, June 5th, at a beautiful new and larger site, overlooking the *Illinois River* at the South edge of Ottawa, Ill. Follow Rt. 23 south through Ottawa, cross *Illinois River* bridge, go up hill, and turn left at Center Street eight blocks to CIO picnic area. Site features large dining hall and kitchen, new auditorium, meeting rooms and space for display of equipment. For the ladies and children, special attractions, all modern facilities, lots of picnic tables, playground equipment, swimming pool, etc. The usual good program and features of previous hamfests. Registration \$1.00 if postmarked before May 28th, \$1.50 at hamfest. Listen on 3940, 3920 and 3515 kc. for late news or write W9MKS, Utica, Ill. for details and advance registrations.

**KANSAS** — The Hi Plains Amateur Radio Club sixth annual Hamfest will be held at Plains, May 22nd. Registration will be \$1.00. A covered-dish luncheon will be served at noon, and everyone is invited to attend. Please bring a covered dish and service for your own group.

**KANSAS** — The Central Kansas Radio Club, Salina, 7th annual Hamfest will be held June 5th. Starting at 10 o'clock till (?); all inquiries should be addressed to Howard Baker, 404 Woodlawn, Salina, Kans.

**MISSOURI** — The Greater St. Louis Radio Amateur's annual Hamfest will take place May 22nd. Games, entertainment for adults and children. Refreshments obtainable on grounds. Admission, adults \$1.00, children free. Creve Coeur Farmer's Club.

**NEW MEXICO** — The Amateur Radio Caravan Club of New Mexico, Albuquerque chapter, will sponsor the 5th annual New Mexico State Hamfest on Saturday and Sunday, June 4th and 5th, in Albuquerque. Stations will be on 29.6 Mc. and 3838 kc. to direct mobiles into Albuquerque. Registration will begin Saturday, June 4th; \$2.50 in advance and \$3.00 at the gate. All amateurs and their families, both in and out of the State of New Mexico, are invited to attend. For further information contact the club at 107 Washington St., S.E., Albuquerque, N. M.

**NEW YORK** — The Rochester Amateur Radio Association will hold its annual Western New York Hamfest Saturday May 21st in the Doud American Legion Post at 898 Buffalo Road (Rt. 33) near the western city limits of Rochester. The tops in speakers and honored guests as usual. Whether your special interest is mobile, DX, traffic, v.h.f., u.h.f., c.d., hi-fi, or renewing old acquaintances, don't miss this one! Registration from 1 P.M. to 5 P.M.

Banquet at 7 P.M., \$3.75 per person as always. For advance registration write to RARA, P. O. Box 1388, Rochester 3, N. Y.

**NEW YORK** — The New York Radio Club is holding its third annual Picnic and Transmitter Hunt at Bethpage State Park, Long Island, N. Y., on Sunday, May 22nd, starting at 11 A.M. Women and children free; all OMs \$1.00. All hams are welcome and a good time is assured.

**OKLAHOMA** — The North Fork Amateur Radio Club of Western Oklahoma will hold its Third Annual Hamfest and Picnic at the Quartz Mountain State Park and Lugert Lake on May 21st and 22nd. Registration fees will be \$2.50. For further information contact Jay Thompson, W5ZZP, Sayre, Okla.

**PENNSYLVANIA** — The Breeseshooter's Tri-State Hamfest will be held on Sunday, May 22nd, at the Lodge, North Park, Pittsburgh, Penna. Registration free. Come one, come all!

**RHODE ISLAND** — The Providence Radio Association will again hold the largest Rhode Island gathering of amateurs, its annual Dinner Dance at Johnson's Hummocks on May 14th at 8 P.M. Entertainment for all.

**TEXAS** — The South Texas Emergency Network will have its tenth annual Convention in Kerrville on May 27th-29th. There will be a barbecue, two dances, two water carnivals, three transmitter hunts, a swap session, and the usual banquet and business sessions. There will be many entertainment and educational features.

## FEED-BACK

In Hadlock, "Improved Audio Circuit for the 50-Mc. C.D. Unit," page 36 of the March issue, Fig. 2 should show a 0.1-megohm screen dropping resistor for the left-hand section of the 6U8.

In Fig. 2 of Thomason, "Mobile S.S.B. Receiver for 80 and 40," in March *QST*, a connection should have been shown between the cathode of the 6BSQ7 and junction of the 0.15-megohm and 2700-ohm resistors and 15- $\mu$ f. capacitor.

A not-too-serious error got past us in "A 5-Band Antenna Coupler," by McCoy, in April *QST*. In Fig. 2, a jumper should be shown between Pins 2 and 4 in "D." If the jumper isn't used, only half of the total capacitance is available.

## Strays

At the request of the local government, VP2DL, Windward Islands, B.W.I., broadcast a debate put on by native officials. The program was transmitted on a non-ham frequency and met with much enthusiasm. *L. to r.:* His Honor, Mr. Josse, Asst. Administrator; Government Secy, Hugh Grell, VP2DL; Missionary Merritt Hoath, VP2DL; and Mr. William Surbrook, VP2DA.

# Hints and Kinks

## For the Experimenter

### LUCITE REPLACEMENT FOR WINDOW GLASS

A SHEET of  $\frac{1}{8}$ -inch lucite, cut to size and used as the replacement for a cellar windowpane, provides an easily worked surface for mounting feed-line feed-through insulators, etc. Mount the lucite in place with regular glazier's tacks and putty. Save the window glass for the day when it becomes desirable to return it to the frame.

— E. M. Fry, K2CW

### FULL RANGE SPEED CONTROL FOR SEMIAUTOMATIC KEYS

A HIGHLY successful method of controlling the speed of a bug or semiautomatic key is shown in Fig. 1. With this system, it is possible to slow down the dot frequency instantaneously to any desired rate.

The drawing is more or less self-explanatory. The only parts added to the original key are a hairpin-shaped piece of iron wire and one or more small cylindrical Alnico magnets such as those used in speaker manufacture. The hairpin is held in place under the thumbscrew which normally holds the sliding weight in position and the magnet or magnets hold themselves in the cradle formed by the hairpin.

The hairpin can be made from a section removed from an iron coat hanger. Before mounting the hairpin, move the regular weight up to

Fig. 1—Detail drawing of the speed-control for bugs or semiautomatic keys.

the maximum speed position. When the cradle is locked in position, orientate it with the open end facing toward the rear of the key. Thus, by merely removing the magnet or magnets, top speed is available without need for loosening any screws. To come down to a slower speed, put a magnet or two on the cradle (preferable sizes are those having a diameter measuring between  $\frac{3}{4}$  and  $1\frac{1}{4}$  inches) and slide same to the most effective position. Even with the heaviest combination of weights on my bug, and while keying at the rate of less than six dots per second, I can

get over 50 cleanly formed dots before the bug comes to rest.

For a few weeks after this idea was first put to work, I had the extra magnets lying around on the desk where they were easily misplaced. When I finally remembered the basic properties of magnets, I simply placed them against the front panel of my receiver where they stay put until wanted.

— Cyrus T. Read, W9AA

### PROTECTION OF TETRODE SCREEN GRIDS

ONE of the disadvantages of using a fixed screen supply is the excessive screen dissipation that occurs when plate voltage is unintentionally removed from the tube. This drawback of the fixed-supply system can be overcome by feeding the screen through the contacts of a normally open s.p.s.t. relay as shown in Fig. 2. Voltage for the relay is obtained from the

Fig. 2—Protective circuit for fixed screen-supply operation.

high-voltage plate supply through the dropping resistor,  $R_1$ . The value of resistance and the wattage rating of  $R_1$  will be determined, using Ohm's Law, by the resistance of the relay winding and by the output voltage of the h.v. supply.

The most desirable feature of the system is that it is automatic. If the plate voltage is removed from the tube because of a blown fuse, defective component or the unintentional opening of a control switch, the relay opens and breaks the screen voltage lead.

— Don Priebe, W8MQQ

[EDITOR'S NOTE: This circuit is quite similar to the one described by W0NCV in *QST* for December, 1952. However, in the event of an opening in the relay winding, W8MQQ's arrangement does not affect operation of the power-supply bleeder as would be the case with the previously-described installation.]

### HOMEMADE RUBBER STAMPS

IN "Hints and Kinks," *QST*, November, 1954, there appeared a brief article on homemade QSL cards printed with a rubber stamp. This prompts me to call attention to an article entitled, "You Can Make Your Own Rubber Stamps," presented in the September, 1954, issue of *Popular Science*.

— Herbert Sinofsky, W2GKS

## PIRATE G

44 Hawkhurst Road  
Coldean, Brighton  
Sussex, England

Editor, *QST*:

I am being inundated with QSL cards, mostly from W hams, purporting to be confirmation of 3.5-Mc. contacts (c.w.) over the past few months and nearly all during the hours 0100-0400 GMT. All report high signal strength — which gives me an impression that the station making these contacts may be on the American continent. At any rate, they are all "pirate" contacts as I do not work 3.5 Mc. and *never* work during the "little hours"! . . .

. . . Their cards sent to me reporting the "contacts" with my station are being held for evidence for the G.P.O. here! Incidentally, my name is Cyril and nearly all the cards sent address me as Carl so I guess my "pirate" is using that name on the air.

— C. T. Fairchild, G3YY

## THIRD-PARTY TRAFFIC

MARS/Amateur Station K3WBJ  
Walter Reed Army Med. Center  
Washington 12, D. C.

Editor, *QST*:

If one listens on 20 meters he is certain to hear Stateside stations handling traffic with the DL4s, Gs, C8s, Fs and others. Most Stateside amateurs do not realize that FCC prohibits third-party traffic with foreign countries, excepting Liberia, Cuba, Canada, Chile, Peru, Ecuador, and those stations operating beyond the continental U. S. A., such as KZ, KP, KG, KL, KA, etc., who are licensed by FCC.

The only way traffic can be passed to the U. S. A. from Germany is on MARS frequencies where the German station becomes a U. S. military station using military calls issued by chief Army or Air Force MARS, Pentagon, Washington, D. C.

It is possible that the Stateside amateur does not know this or is too kind-hearted to reply "Sorry OM, but we are not supposed to handle traffic with DL4 stations."

To those who are accepting 'phone-patch traffic and written messages from DL4 amateurs, I say let's do our duty and follow the rules of FCC — no traffic from Germany on the amateur bands.

— Pfc. Merle W. Wynn, W1DLO

[EDITOR'S NOTE — Message traffic for U. S. military personnel overseas is permitted only with amateur stations identified by properly authorized call signs having a one- or two-letter prefix beginning with W or K.]

## NOT THIS WAY

1595 N. Virginia St.  
St. Paul 3, Minn.

Editor, *QST*:

. . . In tuning across 14 Mc. I hear a weak ET3 in Ethiopia. When he finishes his CQ I call him, but he comes back to a W1. After giving the W1 his report and expressing delight in working the W1 again, he turns it back to the W1. This W1 immediately opens the formalities with the words "Say, I worked you two months ago and I still haven't got your QSL — how come? Also, if you run across that ET2 in Eritrea, tell him I haven't got his, either."

If I had been the ET3, I would have thereupon turned off the rig and slunk away, but the ET3 gamely comes back and says, "Say, OM, mail delivery in this country is really very poor compared to the U. S. A. We consider if we get a letter from your country in two months that that would be

normal delivery time. I also been off the air since last working you as my 837 oscillator failed and I just managed to bum a substitute from a passing camel caravan." He then turns it back to Soft-hearted John, the W1 station, whose first words of sorrow, condolence, and understanding go like this:

"Well, if mail delivery in your country is so lousy as to take 2 months, you'll probably be getting my card any day so how's about mailing me your card airmail today?" I never did hear the ET3 come back to that bit of genius so maybe even he forgot he was a gentleman.

To my mind a suitable cartoon to illustrate how bad this QSL mania has become would be one like "Gil" made up years ago of a big bandit with a blackjack in his hand hovering over a small cringing citizen and overheard the words "Gimme your handle"; but in this case substitute the words "Gimme your QSL."

. . . I wonder how many U. S. hams understand the value to a foreign ham of postage. Eight cents is plenty but even to me 25 cents for airmail is pretty strong between paydays. I looked up the ET3 and he was listed as an Air Force man so I would presume even he ate off crockery and not gold plate. (Ethiopian Air Force man, that is.)

Every time a DX station calls CQ, hordes of U. S. stations call him and flood him with QSLs. He no doubt already has hundreds of U. S. cards, but being a gentleman, he is obliged to mail his in return and postage can become an important item. Include return postage coupons to defray the return postage and to help remind him to QSL. If he happens to be wealthy, he can turn the postage money over to his favorite charity.

Don't lose your head if a foreign ham doesn't QSL. Who knows — maybe he is having labor trouble with the fellows that turn his tread-mill-powered generator like the OQ5 in the Belgian Congo I read of years ago. After all, it's not quite as bad as having a doctor tell you that you have cancer.

— Cliff Proetz, W0PDN

## 'PHONE-BAND C.W.

133 Cherry Ridge Rd.  
Peoria, Ill.

Editor, *QST*:

I read the letters sent in by W5UWQ and W4UWA (March 1955, p. 46) and I agree with both of them, to a certain extent.

Contrary to what most 'phone addicts seem to think, c.w. is not "a thing of the past"; it plays just as large a rôle in ham radio as 'phone does. I will admit, however, that some c.w. operators are inconsiderate enough to work in the 'phone bands, and I agree that these bands should be set aside for 'phone only.

As for s.s.b., the letter from W8HKE (right below the other two letters) hits the nail on the head. I hope most of the anti-s.s.b. men read it carefully.

Let's face it; all three are here to stay. Instead of arguing about which one to eliminate we should try to get 'phone and c.w. separated, and convince those d.s.b. guys that s.s.b. is doing more good than harm.

— Bill Wildfong, W9IWC

58 Throop Ave.  
Auburn, New York

Editor, *QST*:

In reply to W5UWQ's letter griping about c.w. on the 'phone bands — I agree with him completely. However, I feel that something should be done about the overlapping of the VE 'phone band and the American Novice band on 80

(Continued on page 144)

# YL NEWS and VIEWS

BY ELEANOR WILSON,\* W1QON

## Additional YL Clubs

The following augments information on YL clubs given in this department last month:

**Canal Zone QRMarys** — YLRL unit; organized 1952; seven members (all of the Canal Zone YLs); meets bimonthly at members' homes; no dues; president KZ5DG, Grace Dunlap, Box 28, Balboa Heights, C. Z.; issues the Canal Zone QRMary-Go-Round Certificate.

**San Diego Young Ladies Radio League** — YLRL unit; organized 1947; seven members; meets second Friday of the month at the American Red Cross Building, 3650 5th Ave., San Diego, Calif.; no dues; president, W6OLP, Alice McCleary, 1524 Missouri St., San Diego 9.

**NYL Club** — Composed of wives and feminine relatives (licensed and nonlicensed) of members of the Black Hills ARC, Rapid City, S. Dak.; organized 1948; meets monthly in members' homes; dues \$1.25 a year; purpose is to assist the Black Hills ARC with its annual hobby show and to aid in its recreational program.

## Sentiments on C.W.

What is c.w. to me? It is a magic key that opens many mysterious doors — an ethereal bridge forged of countless dits and dahs, borne aloft on the wings of light, space, and divine mystery . . . a sparkling want that spans great distances or hops backyard fences to afford its disciples a brief glimpse into the lives of others. . . . It is a lilting language which commands either detached respect or frank and warm love, depending upon whose mind it touches. . . . C.w. is a subtle bonding agent that delicately welds two strangers into an intimate oneness for a fleeting moment . . . a delightful, tantalizing and yet thoroughly satisfying mistress to all her lovers.

These thoughtful words were copied by OM W6KMJ, Dan Peterson, of Long Beach, during a recent 40-meter QSO with W6OQY, Betty Entner, of Coronado. Dan, impressed by Betty's "beautiful bug fist" and devotion to c.w., shares her sentiments with us with the hope that they may strike a spark in the hearts of many struggling YL Novices and inspire them toward the mastery of the necessary 13 w.p.m. for their General Class license.

\*YL Editor, QST. Please send all contributions to W1QON's home address: 318 Fisher St., Walpole, Mass.

## COMING YL GET-TOGETHERS

May 20th-22nd — LARK Convention,  
W9 YLs, Alorton Hotel, Chicago.  
Write W9MYC.

June 24th-27th — First YLRL International Convention, Hotel Miramar,  
Santa Monica, Calif. W6UHA, general  
chairman.

## YLs You May Have Worked

Lenore Kingston Conn, W6NAZ, has been a familiar face and voice to countless amateurs and to the general public as well for some 15 years. Licensed in 1939 (as W9CHD, later W2NAZ), she has combined her multiple radio activities with years of free-lancing as a radio actress and a commercial announcer for radio and TV.

Considered "a sort of 'pioneer'" in TV, she started work in that medium in 1941. Lenore is a member of the Los Angeles YLRL and a charter member of the YLRL (Vice-Pres., 1947). She is currently editing a second edition of the YLRL Directory, which will contain information on more than 500 YLRL members. She also edited the first edition in 1948. Married to W6MSC, technical director for NBC-TV, Lenore divides her hobby time at her Sherman Oaks QTH between c.w. and 'phone, primarily on twenty. Lenore's friends testify that she is a conscientious worker and deserves the success she has enjoyed in her vocation and avocation.

## Keeping Up with the Girls

The annual luncheon and installation of officers of the N.Y.C. YLRL took place Feb. 19th at a downtown restaurant. YLs who attended were new officers W2IQP, Pres.; W2IGA, V.P.; W2MYV, Secy.; Helen Zuparn, Treas.; and members JF2s EEO, EUL, JZX, OWL, PZA, QGK, QWL, TBU, K2AFR, and KN2DPN. . . . Three KZ YLs plan Stateside vacations this summer: KZ5KA, Kay (W9RIH), KZ5PL, Pat; and KZ5DG, Grace (W6DLU). KZ5DG worked all but six of her 240 contacts in the YL-OM contest on 15 'phone. . . . WSHWX, Lillian, hasn't missed a session of the 40-meter YLRL net since its inception in 1953. . . . W4YYJ, Lois Anne, has her 25w.p.m. Code Proficiency Certificate. . . . VE3DEA, Denny, attended a ham gathering in Scotland and enjoyed meeting 150 OMs, some of whom she has QSO'd on 20 'phone since returning home to Toronto. . . . During the Mothers' March of Dimes for polio, W4UDI and W4UDQ relayed to mobiles who picked up money at various collection points in Memphis, Tenn. Lenette and D. B. also assisted with relays in a welcome-home reception for the National March of Dimes poster child. . . . W1ZOL, Leta, of Bangor, Me., has assembled a Johnson Ranger and is enjoying 40 meters. . . . W1LYR continues to handle considerable traffic for Presque Isle and vicinity. Along with W1UZR, Rita, and W1YTE, Isabel, Hazel checks into the Sea Gull Net daily. . . . W1YYM, Ellen, of Hq., reports that about 6 per cent of participating Novices in the 1955 Novice Round-up were YLs — by call: WN1COL, KN2s INQ, KER, WN3YTM, WN4HYV, KN6s EIG, HTC, HWH, WN7WHV, WNSUAP, JN0s UZM, VGE, VVY. . . . W4RLG, Frances, YLRL chairman of the Fourth District, is home after almost a year in a hospital. . . . Two new harmonics announcements: a boy in February to W3RXV, Peg, editor of YLRL Harmonics, and OM W3RXW; a girl in January to W4HHI, Joanne.

(Continued on page 148)

# Armed Forces Day Program—May 21st

**T**he Army, Navy and Air Force invite all U. S. amateur radio operators to participate in the Armed Forces Day Program for 1955. The amateur activities are jointly sponsored by the Army Signal Corps, Air Force Directorate of Communication, and the Naval Communications Division.

A receiving contest will be open to anyone who can copy International Morse Code at 25 w.p.m. Listeners who submit a perfect copy of the transmission will receive a Certificate of Merit, attesting to their code-copying proficiency, from the Secretary of Defense.

A military-to-amateur transmitting and receiving test will be conducted for all holders of valid U. S. amateur radio licenses. Headquarters stations of the Army, Navy and Air Force will establish radio contact with amateur stations and will acknowledge these contacts with special QSL cards. Each service headquarters station will QSL separately so amateurs will have an opportunity to qualify for three different QSLs.

In addition, a radioteletype transmission will be sent from MARS Headquarters and from official Navy stations. Any amateur station capable of receiving radioteletype transmissions is invited to copy the special message. A special letter of acknowledgment will be awarded to each amateur who participates.

MARS directors and Naval Reserve organizations are being urged to feature radio activities at their military installations as part of this year's plan for inviting the public to visit the Armed Forces "at home" in 1955.

## C.W. Receiving Competition

The c.w. receiving competition will feature a message from the Secretary of Defense. All individuals, amateur operators and others, are eligible to participate. A Certificate of Merit will be issued to each participant who makes perfect copy.

Transmissions will be at 25 w.p.m. on the following schedules:

May 21st	Station	Frequencies (Kc.)
1900 (EST)	WAR	14,405; 20,994
1900 (EST)	NSS	121.95; 4390; 9425; 12,804; 17,050.4; 22,491
1900 (EST)	AIR	3347; 6997.5; 143,460
0600 (GCT) (0100 EST May 22, 2200 PST May 21)	WAR	14,405; 20,994
2200 (PST)	NPG (Navy Radio, San Francisco)	114.95; 6428.5; 9277.5; 12,966; 17,055.2
0100 (EST) (May 22)	AIR	3347; 6997.5; 143,460
1100 (GCT) (2000 Item May 21)	NDT (Navy Radio, Yokosuka)	2287.5; 4545; 9427.5; 13,471.5; 16,445; 23,010

Each transmission will commence with a five-minute CQ call. It is not necessary to copy more than one station, and no extra credit will be given for doing so. Transmissions should be submitted

"as received"; do not correct possible transmission errors. Punctuation will be spelled out and should be copied as sent. Copies should be mailed to Armed Forces Day Contest, Room BE-1000, The Pentagon, Washington 25, D. C. Time, frequency, and call letters of the station copied should also be included.

## Military-to-Amateur Test

Military stations WAR, NSS and AIR will be on the air between 1800 and 2400 EST on 21 May 1955, to contact and test with amateur radio stations. The military stations will operate on spot frequencies outside the amateur bands as follows:

	Frequencies (Kc.)
WAR (Army Radio Washington)	4025 (A-3) 6997.5 (A-1)
NSS (Navy Radio Washington)	4010 (A-1) 7375 (A-1) 14,385 (A-1)
AIR (Air Force Radio Washington)	3347 (A-1) 7635 (A-3) 14,405 (A-3)

Contacts will consist of a brief exchange of location and signal report. The military station will not be permitted to handle traffic nor exchange messages.

## Radioteletypewriter Receiving Competition

The radioteletypewriter receiving competition will feature a special joint message from the Chief Signal Officer, USA; the Director, Naval Communications, USN; and the Air Force Director of Communications. A letter of acknowledgment will be sent to each amateur participant who submits a copy made from the radioteletype transmission of this message. Transmission will be at 60 w.p.m. on the following schedules:

May 21st	Station	Frequency (Kc.)
1300 (EST)	NDC (Norfolk, Va.) AIR (Washington, D. C.)	7375 7915
1300 (CST)	NDS (Great Lakes, Ill.) A4USA (Atlanta, Ga.)	7375 5760
1300 (MST)	NDF (New Orleans, La.) or NDW2 (Salt Lake City, Utah)	7375
1300 (PST)	A5USA (Fort Sam Houston, Texas) NDW (Treasure Island, Calif.) AF6AIR (Hamilton AFB, Calif.)	14,405 7375 14,405

Each transmission will commence with a period of ten minutes of test and station identification to permit amateurs to adjust their equipment. At the end of the test period, the message will be transmitted. Copy should be submitted "as received" to Armed Forces Day Contest, Room BE-1000, The Pentagon, Washington 25, D. C. Time and call of station copied and name and call of amateur receiving the transmission should be included.

CONDUCTED BY EDWARD P. TILTON, WHDQ

THE best 50-Mc. season in years could be about to begin. Interest in the band, lagging for some time, shows every sign of coming back strong. How well it comes back will depend on how well we respond to the opportunity that is inherent in the opening of the band to Technician Licensees, effective April 12th. Conditions are almost sure to be better than for several years, and for the first time we have a real incentive that will attract new hams. Now it's up to 50-Mc. enthusiasts the country over to make the most of this chance to sell the band, and keep it sold.

Why has 50-Mc. interest lagged? We have to go back to the resumption of activity following World War II for all the factors. One certainly was war-surplus gear, or the lack of it. Right at the most opportune time for the good of the 2-meter band, just as we were changing over from 112 to 144 Mc., thousands of SCR-522s and other surplus gear for the new band were dumped on the market. You could get on 2 for next to nothing, and v.h.f. men by the thousands snapped up the chance.

But the 6-meter band enjoyed no such bonanza. During the first months on the air, we had to make the shift from 56 to 50 Mc., at a time when there was no gear, surplus or new, for the new frequency. What we had we made ourselves, and it is a credit to amateur radio that we managed to show several hundred active stations on 50 Mc. almost at once. The 6-meter band was intriguing territory, and it attracted quite a few operators who were interested in more than just routine QSOs, though it was good for that kind of hamming, too.

Then came TVI. First in the New York area, then elsewhere as new TV stations appeared on Channel 2, 50-Mc. men found the going too rough for many of them. Since the lifting of the TV allocations "freeze" and the resultant open-

ing of many new Channel 2 stations around the country, the number of active 50-Mc. stations has dropped off from its already none-too-healthy level.

TVI in Channel 2, from 50-Mc. transmitters, is undoubtedly one of the more difficult problems hams have had to face, but there are redeeming factors, even here. Not the least of these is the less avid interest in TV on the part of the general public. Televiewing is more general than ever, of course, but with more than one channel available in nearly all localities, interference in one of them is not the life-and-death matter it once was. Remember, too, that it is usually a receiver fault; if your rig is "clean" you can stay on the air. And we are learning that the Channel 2 problem is not insurmountable. W2IDZ showed the way in a two part article in June and July, 1954, *QST*; an effort that won him second place in the "Outstanding *QST* Article of the Year" contest for 1954, incidentally.

How bad is the problem, anyway? It's rough, if you live in a weak-signal Channel 2 area, with a forest of TV antennas around you, but there are several tricks that can be employed advantageously, in addition to the filters described by W2IDZ. It's a local problem, mainly, so you can help things a lot by using a high antenna, to keep the main radiation pattern from warming up neighboring TV arrays. Low power works

This antenna system could be the means of achieving the long-sought goal of 144-Mc. DX up the Pacific Coast. A 30-foot parabola mounted on a dolly, so that it can be rolled around on the flat roof, it is erected on a 1200-foot elevation directly above Hollywood. The lights of the Los Angeles area stretch out for 20 miles toward Long Beach in this night shot by KN6GLG. K6EGP is seated at the left, W6COH climbs the framework on the rear of the reflector, and K6BNW is at the right. W6MJ, who sent the picture in, says that a kilowatt rig will be feeding the array this spring.

wonders, and fortunately, operating on 6 with no more than a few watts can be real fun.

If you don't have Channel 2 to worry about, 6 is likely to be one of the most TVI-free bands we have. What interference you do encounter is easily cured, in almost all cases except where Channel 2 is involved. In many areas, the extensive shielding and filtering, now so commonly practiced in low-frequency circles, may be wholly unnecessary. Thousands of U. S. hams could operate around the clock on 50 Mc. without the slightest worry about TVI. The main thing is to get them to try it!

A series of *QST* articles for the 50-Mc. newcomer begins in this issue. Technician licensees in all parts of the country will be building 6-meter gear in the coming months. One of them may be your neighbor, or a member of your radio club. Like any other beginner, he may need help. When he gets ready to go on the air he'll need someone to talk to. It's some time since we've had an opportunity to develop new activity on 6. Let's not mull this one!

### Here and There on the V.H.F. Bands

The best West Coast 2-meter DX in several years is reported this month by K6CAL, San Diego. Her 146.5-Mc. signals were heard by W6SKX/mm at a distance of more than 600 miles out in the Pacific, at 2037 PST, Jan. 28th. The report was delayed until the completion of a round trip by the *Hawaiian Rancher*, the ship on which W6SKX makes the run to K116-land regularly. Cliff has also heard the Bay Area repeater station, K6GWE, at distances of more than 300 miles.

Such reports point up the fact that conditions along the Pacific Coast may be very favorable for long-distance v.h.f. propagation. The K6GWE antenna is a simple nondirectional affair, and the 16-element beam at K6CAL/W6IBS was aimed at Los Angeles during the 600-mile reception, so the signal was heard off its side. How long will it be before home stations in San Diego or Los Angeles work into the Bay Area, or farther? We feel that such an event still awaits only the use of high power, big antennas, c.w. techniques, and selective low-noise receivers on regular schedules.

A likely prospect for such DX is the set-up shown in the adjoining photograph. This 30-foot parabola should provide the antenna gain (though we feel that the dipole is in the wrong position!) and the members of the Two Meter and Down Club who are in back of project say that there will be a high-powered rig feeding the big array this spring. This would seem to have what it takes to work K6GWE, W6AJF, or any of the other good set-ups in the Bay area, and it shouldn't stop there. With W6JIP, W7OKV and others around Portland using high power, and W7LHL reported to be nearly ready to go with a kilowatt rig in Seattle, why stop at the Bay area?

It's less than 1000 miles from Los Angeles to Seattle. Portland is about 850 miles. San Diego to San Francisco is less than 500 miles. Are these impossible distances on 144 Mc. in 1955? Having had a good look at the terrain along these paths last fall, we still feel that the best possible equipment and techniques will turn the trick within a month of the first time they're tried. We hope that there is provision in that Hollywood array for going to horizontal polarization, and that there will be a keying jack in that high-powered rig!

An attractive prospect for 2-meter DX off the Atlantic Coast is Bermuda. W3YJH sends word that VP9BM is to be on 2 regularly with 100 watts, a low-noise converter and a rhombic centered on Philadelphia. Address: M/Sgt. J. W. Wenglar, 1934 AACs Sqdn, APO 856, Postmaster, N. Y.

Another buddy of W3YJH (when they were DL4CK and DL4XS on 144 Mc.) is getting set to make a name for himself on 144 Mc. in North Africa. Jo visited us during the winter, full of plans for high power, rhombics, hot converters and other 2-meter DX necessities. Then he was about to hop off for Casablanca, and we're standing by to hear from him

any day that he is ready to take on all comers for a shot at the 2-meter DX record.

In the spring, the young man's fancy lightly turns to thoughts of expeditions to choice v.h.f. locations. Here are two trips that are well along in the planning stages. W8JWV and W8GUZ have been dreaming this one up all winter. They will operate W8JWV/4 from the summit of Mt. Mitchell, in North Carolina, the night before and during the June V.H.F. Party, the 7th, 8th and 9th. A 16-element array will be used on a 75-watt 2-meter rig with an 829B final. Operation will start around 1900 EST, June 7th. Mimeographed notices have already been sent out to a considerable mailing list, and final details will be sent just prior to the Party.

And here's one to delight the hearts of searchers after 50-Mc. WAS. W2QCY has decided that something has to be done about the lack of 6-meter stations in certain Western States. Roy is planning to load his panel truck with 6-meter gear and take off for Nevada, Utah and possibly other states that are keeping scores of 50-Mc. men from achieving WAS. This expedition will be well equipped as to gear, antennas

and emergency power, and operation is scheduled for the height of the DX season, in the latter part of June and early July. There should be a batch of new candidates for the coveted 50-Mc. WAS award before W2QCY/7 finishes his rounds. Right now, Roy is looking for two stalwart and experienced 6-meter DX men to accompany him. Any takers?

If you prefer picnics to expeditions, here are a couple of talk-eat parties scheduled for the same date, July 31st. The Annual Turkey Run V.I.F. Picnic, a fixture in Midwestern v.h.f. circles, will be held, as always at the State Park of that name, just north of Terre Haute, Ind. W9ZHL, Terre Haute, is the man to see for more information. And W8NOH, Grand Rapids, Mich., tells us that the v.h.f. fraternity of Western Michigan will congregate for the same purposes at Allegan County Park on the shores of Lake Michigan, also on July 31st.

W8NOH also writes of an interesting comparison of 2 and 75 in checks made with W9RXS, Milwaukee, Wis. This path of about 120 miles across Lake Michigan shows very satisfactory signals with 100 watts on 144 Mc. On 3.9 Mc., a 400-watt rig has rough going, what with skip effects and heavy QRM.

A 175-mile sked has been kept reliably on 144 Mc. by W9ZHL and W9YRX, near St. Louis, since last October. On only three occasions since that time has communication been difficult on voice, and many other stations in the St. Louis area and Western Illinois have called in also.

Last month we mentioned the appearance of W1DEO, Cape Elizabeth, Maine, on 144 Mc. Herb has been on regularly since, working W1OOP, Needham, Mass., nightly. He is also on 50 Mc., and is working down into Connecticut on that band also, though signals are stronger on the higher band, when conditions are above normal. W1DEO is presently working on 144.12 and 50.7 Mc.

If you were waiting for a shot at Florida, following our recent report that W5VWU was moving there, don't wait any longer. W5AJG writes that he worked W5VWU/mobile, en route back to New Mexico. Leroy reports that the tropospheric season began early this year, in the Gulf States, with W4UUF, Pensacola, Fla., working into Texas on the night of March 11th. The following morning signals were excellent from W5RCI, Marks, and W5JTI, Jackson, Miss., so W5RCI and W5AJG went to 220, for their first contact on that band. The distance is about 370 miles. W5AJG has been running daily skeds on 144 Mc. with W5UXK, Watonga, Okla., 230 miles, for the past three weeks without a miss.

The 220-Mc. band is very much alive in Swarthmore, Ridley Park, Springfield and other towns west of Philadelphia, according to W3TEE. Several stations are on nightly between 2100 and 2200, some having been at it for several years. W3UGA holds the local record with more than 1000 QSOs on 220, and W3KPK is not far behind. All sorts of equipment is in use, including simple modulated oscillators and dipole antennas. Anyone needing help in getting started may get in touch with any of the gang, the more active members being W3s A1IL KPK RWH QMQ QZT TEE UGA UKG YQS.

The Philadelphia area is good round-table territory. A 6-meter group has held forth each Monday night for years, and they frequently join in a similar session held in the Washington area on Sunday mornings. The over-the-air friendships thus formed were brought to a more personal status on March 20th, when a delegation consisting of W2ORA and W3s CGV CUB MXW RQT GGR and WSNRM/3 visited the Washington stations in a body. First stop was W3OJU, District Hts., Md., where W3s YH1 JES UJG WOD and W4CUMF joined the party. Next they converged on W3OTC, Silver Spring, where Bob played them some recordings to show how their signals sound at the southern end of the circuit. The final shack stop was W3KMY, Chevy Chase, where a main attraction was a 5-over-5 array for 50 Mc., soon to be described in QST. The party wound up with dinner at O'Donnell's Restaurant. A return visit to the City of Brotherly Love is now planned.

More Philadelphia area v.h.f. activity: The York Road Radio Club has about 40 crystals on 146.25 Mc. An informal net is conducted each Sunday at 0930 on this frequency, with the club station, W3RDM, as control. A club project recently completed the construction of 14 tunable converters, with 6BQ7 front ends. A companion transmitter is next on the program. Chief engineer for this project is W3NKD. The club is pushing for polarization standardization, to end

the confusion now prevalent within a 100-mile radius, and they want ARRL to assist in this.

For a long time we've been pushing as hard as we know how for horizontal polarization. Conversion to horizontal is well along throughout New England, New York, and Northern New Jersey. In view of the improvement in working range that has resulted, and the excellent results in working the vertically-polarized mobile stations that have shown cross polarization to be no problem in that connection, we feel that there is little reason to continue vertical polarization at any home station. The way to get standardization on horizontal is simply to change over. If any appreciable number do it, the rest will follow.

## OES Notes

*K2BAH, Richmond Hill, N. Y.* — Would like to hear from near-by operators interested in 220 Mc.

*K2DYC, Phelps, N. Y.* — Made several crossband contacts 220-144 Mc. with W2QS, but no activity heard on 220 as yet.

*W3UQJ, York, Penna.* — New 50-Mc. rig with 4D32 in final, and 3-element array nearing completion. New 220-Mc. station, W3AJD. Nightly skeds kept with W3LZD on 220.05 Mc. at 2200, and Sundays at 0900 and 1230.

*W4HHK, Collierville, Tenn.* — Joint 50-Mc. receiver project with W4BAQ. Has crystal-controlled front end that can be switched to either communications receiver tuning 7 to 11 Mc., or to fixed-tuned i.f. for reception of local CD net frequencies. Meteor skeds on 144 Mc. continue with W2UK and W1H1Q, as do scatter skeds with W4PCT and W9WOK. Statewide Tennessee net on 50.5 Mc. in prospect.

*W4UW, Miami, Fla.* — New 6-meter converter completed. Made duplex crossband contacts, 2 to 6, with W4KQG, and with W4ZDR on 11 and 6.

*W5FPB, Albuquerque, N. Mex.* — Reception of unidentified DX signals from the west on 144 and 432 Mc., Feb. 18th, reported by W5DNK and W5FAG.

*W7JRG, Billings, Mont.* — New 6-meter rig and beam ready for the spring DX season.

*W8WKN, Columbus, Ohio* — Work well along on 432-Mc. tripler-amplifier using 6324 tubes. Converter for 432 Mc. modified to tune 8 to 12 Mc., replacing the former tripler-conversion arrangement to 50 Mc. Lots of local activity observed on 144 Mc.

*W8MON, Lawrence, Kansas* — 2-Meter band checked daily on hour and half hour, 0630 to 0800, and evenings beginning at 1930 CST. New 125-watt rig for 50 and 144 Mc. completed. W8KEC and W8ZDB working on 420 Mc.

## W7VMP 144-Mc. May-June Schedule

Experience has shown again and again that 144-Mc. signals can be heard over paths of up to 500 miles consistently, if optimum equipment and techniques are employed at both ends. What lies in between, in the way of mountains, may have very little to do with it, except that when the mountains are at the right point along the path the signal is better than would be the case over flat terrain.

Most of our inability to work over mountains on the v.h.f. bands in the past has been the result of insufficient power, ineffective antennas or poor receivers. With these factors taken care of, v.h.f. men in many locations that once seemed "impossible" are finding that 2-meter DX can be worked. The only real problem, when equipment is taken care of, is the lack of stations to work.

We would have once considered it ridiculous to try 144 Mc. between Phoenix, Ariz., and Los Angeles, for instance, but W7VMP has done it often. Results have also been obtained on schedules with Albuquerque, a mountainous path of about the same length in the opposite direction.

After a rebuilding operation on the exciter, in the interest of improved e.w. stability, The Three Fenwicks are ready for more 144-Mc. DX schedules. Here is what W7VMP will be up to in May and June. All times are in MST. Transmissions will be on c.w., with 1 kilowatt input. Frequency: 144.0165 Mc. Antenna: 32 element horizontal array, 72 feet up. 2000 — transmit east. 2005 — listen east. 2010 — transmit northeast. 2015 — listen northeast. 2020 — transmit north. 2025 — listen north. Other skeds will be made, and kept, upon request.

# TI9MHB

## Or Why a DXer Leaves Home

BY JOHN R. BECK, \* W6MHB

OFF the west coast of Costa Rica lies fabulous Cocos Island, subject of many legends concerning hidden pirate treasure. While eavesdropping on a QSO between KV4AA and W6VBY, I learned that an expedition had been organized to journey to that tiny dot in hope of finding legendary pirate loot. Moreover, the adventurers needed someone to keep them in touch with their families via amateur radio. Being a DX-minded ham, this was a wonderful opportunity to set up as a rare DX station and be part of what promised to be a highly exciting adventure.

Arrangements were made for me to become a member of the expedition and it looked as though I was all set. My XYL, Margaret, said that I would kick myself for the rest of my life if I didn't go, and my employers — the Navy Department — in effect said the same thing.

On January 8th our party sailed from Los Angeles for Costa Rica on the *Isle of Capri*. Operating as W6MHB/mm on 21 Mc., preliminary traffic handling was commenced along with a few conventional QSOs. Many contacts were made despite an S9 noise level from numerous generators, fans, blowers and the like. During our voyage, the ocean was generally smooth except for two storms that lasted five days out of the thirteen we were at sea. Nevertheless, I was unable to operate for only one day; it was just too rough to sit on my camp stool in the radio shack. Also, I had wheel watches from twelve to four — both morning and afternoon — causing operation to be limited to the morning hours during which 21 Mc. was open.

On the second day out of Los Angeles, we received news that Costa Rica was in a state of revolution. Naturally, there was much worry over this, both among the expedition members and stations worked. Roy Colwell, W6LW, undertook to relay news concerning the rebellion. Broadcast reception was anything but dependable.

We arrived at the Costa Rican port of Pun-

taenas on the 21st of January — a very hot and steamy spot. Upon clearance with the Port Captain, we took a jeep to San José, capital of Costa Rica, to have our contract to hunt treasure signed and seek permission for amateur operation while on Cocos. The fact that our treasure-hunting contract with the Costa Rican government clearly stated that there was to be no radio communication, except with government stations on the mainland, definitely complicated matters. Conferences with Tommy Gabbert, TI2TG/K6INI, brought out information that the Radio Club of Costa Rica was greatly interested in having Cocos represented on the DX bands. He said that David L. Maduro, TI2DLM, the guiding light of that organization, would be the man to see for assistance in securing government approval. David was contacted and he and I made trips to see the radio inspector. It was agreed that if no mention was made of the purpose of the expedition, it might be possible to operate as TI9MHB. With the signing of the expedition contracts to hunt treasure on the island, permission was granted.

I was really in high spirits!

We departed for Cocos with a full crew and all of our equipment. The voyage again was smooth, and at four on the morning of February 7th, we dropped anchor in Chatham Bay. There was work aplenty to be done. Rafts had to be constructed and camping gear and food had to be moved ashore, not to mention setting up ham radio gear. Landings were difficult in the surf and could only be made at low tide as places to beach the small boats often became non-existent. Furthermore, many jagged rocks protrude from the water, making the shore boat-work dangerous as well as difficult.

By sundown on February 9th all of the radio equipment had been unloaded and set up. The generators were serviced and tested and all was ready with the exception of an antenna system. A clear spot extending across the sandy beach looked like an ideal place for installing a long-wire. Don Wallace, W6AM, had previously presented me with

♦

Operating as TI9MHB from Cocos Island, John R. Beck, W6MHB, spent many hours at his operating position to provide a large number of stations with a rare DX contact. Working 15 to 160 meters, 204 contacts were logged at his remote location.

♦

QST for

a good-sized spool of wire which was strung 900 feet to a tree trunk on the far side of the beach. Height: about *ten feet* above high tide!

The transmitter was tuned to 7003 kc. and seemed to perk. Two receivers were in operation, one to monitor my own transmissions and the other to listen to the frequency specified for stations calling.

To test the long ears of the DX fraternity, first transmissions consisted of "DE TI9-MHB," sent once and at intervals. Nothing happened for several minutes. The boys were supposed to be waiting on pins and needles and for a time it was thought that the super long-wire was not so super after all. Finally W1DDF answered; then he of the calloused ears, KV4AA. While a five-minute QSO with Dick was in progress, the boys caught on and the pile-ups were beginning to form.

Our camp's location was excellent for working the United States and Europe. Since most of the island terrain is very steep, the only direction in the clear extended from approximately the Rocky Mountains eastward to North Africa. The effect of the hills was borne out by the fact that all Pacific island signals were quite weak. EL2X was worked, but his fine signal was all but inaudible most of the time.

The reports received while using the long-wire were not too favorable. To correct the situation, a ground plane for 40 meters was put up on the beach area when the tide was low. Rocks weighing up to one hundred pounds were piled to a height of six feet around the base of the supporting poles. The ground wires were tied to some of the larger rocks surrounding it, but the first time the waves roared in they were scattered over the surrounding area. However, the antenna remained erect and it was left that way for the entire period of operation. Later an antenna of the same type was put up for 14 Mc. When the tide was in, water came to within eight inches of the bottom of the radiator and the ground planes were submerged.

Fifteen meters was good while it was "in." Calling stations apparently did not hear each other too well as there was quite a bit of calling out of turn. For 'phone operation, it proved to be the best band because of the lack of commercial QRM and the amount of space available.

Twenty, of course, was the stand-by in the daytime. Usual conditions prevailed except that W6s required openings for loud signals. These occurred in the early morning and just before the band closed for Ws in the late afternoon. During the openings, W6 signals were tremendous

and equaled those from other districts. Normally, most stations heard from W7-land eastward were S9 during the entire daylight period.

Operation on 14 Mc. 'phone was slow because of the large number of strong stations calling simultaneously. Nevertheless, many contacts were made in spite of the QRM.

For the first few evenings Forty was very good but when the pile-ups got down to the weaker stations commercial interference became troublesome.

Eighty provided a big surprise. It seemed to be the best band for all-around contacts and many stations reported our signals strongest on that band. It was found that the long-wire did not function too well on Eighty. Something better had to be erected. Two trees, one in our camp, were found situated about 150 feet apart. A bow and arrow, used by one of the expedition members for hunting, was used to get a piece of light twine over one of the trees. The twine was fastened to an insulator at one end of a 3.5-Mc. doublet and then raised. One of the Costa Rican boys climbed, "Tarzan style," up the vines that hung from the other tree and secured the far end. This new antenna was forty feet high and seemed to perform very effectively.

◆  
The *Isle of Capri* being made ready for the voyage to Cocos Island.  
◆

Many European contacts were made on all bands and I was greatly surprised at the solid signals that were booming in from that part of the world. Many U.S.S.R. stations were heard working each other. In fact, several times during our schedules with W6LW, these stations were much louder than Roy.

A few contacts were also made on 75 'phone, but broadcast harmonics from the Mainland proved troublesome on that band.

I had promised several of the 160-meter gang that I would make an attempt to operate on the "top." So the old long-wire was loaded up and several CQs were sent. Just about the time it was thought that 160 was for the birds, W0NWX, "ye olde Clippertonian," heard my peanut whistle and the first 160-meter QSO with Cocos was in the books. Twenty-one contacts on that band followed. Subsequent reports from England indicated that TI9MHB was heard in Europe by at least one listener. The morning after the 160-meter operation, seaweed was hanging from the long-wire. How the thing worked is beyond me!

An attempt was made to improve the contact format used by previous expedition and contest ops. One gimmick was to end a transmission with the call of the station being worked, the idea

being that everyone calling should know the characteristics of my signal. Also, if there was interference during the first part of my transmission, it might be gone before the end. The fact that very few repeats were requested indicated that the practice paid off.

Another scheme, although not new, was to specify the calling frequency. I had my VFO running at all times so I was unable to listen in on my own frequency. Calls were always requested to be from ten to twenty kc. higher.

On twenty 'phone, especially, the calling frequency system was abandoned because the resulting heterodynes were so fierce that it was impossible to read anyone. The practice of not specifying a listening frequency and continuously tuning over the entire 'phone band was the only logical solution. This jammed up the band fairly effectively for everyone but seemed to be the only way that stations could be copied. Some of the *sharper* (?) operators would make nice long calls after every transmission from me. Naturally, this did nothing to alleviate QRM.

Several hundred messages were handled and the expedition crew and their families were quite pleased with TI9MHB's efforts to maintain efficient communications between them. The DX gang stood by in a most commendable manner during the traffic-handling periods. All traffic for the expedition was handled by W6DFY, W6LW, W0CO and W0ELA.

Who provided the best signals? W4KFC was one of the better from the East Coast; even on 160 he peaked to S9. The Midwest provided the most consistently strong signals. W8DUS was always thundering. From the West Coast, W6YMD stood head and shoulders above all others.

Finally, on February 22nd, the expedition had completed its task. The equipment was loaded aboard the *Isle of Capri* and we sailed for Puntarenas on the evening of the same day. Upon my return to San José, Ted Westlake, TI2BX, and his wife, Virginia, invited me to their beautiful country home. It was there that the process of returning flesh to my bones began (I had lost some fifty pounds during the expedition).

Later, W6LW, W6TT and TI2RU arranged for me to fly home. Arriving at the Oakland airport, I was greeted by W6DIP, W6LW, and Margaret, my ever-faithful wife.

In conclusion, thanks to all who helped make TI9MHB a reality: The Northern California DX Club; the Radio Club of Costa Rica; W6TT and W6DUB of Elmar Electronics who supplied a good portion of the equipment; W6DIP who loaned me a receiver and a generator; and W6KEK who supplied another generator.

The TI hams are certainly a wonderful group and their hospitality and generosity are not easily exceeded. They treated our group royally and we are more than grateful for their help and consideration.

And so now — the end of a wonderful journey. Did I hear someone say, "Where next?" ?

The shore at Chatham Bay is littered with rocks. The larger ones are carved with the names of ships and seafarers who have visited Cocos. Some inscriptions date back over 100 years; almost to the time pirates were active in the area. The expedition also left its share of autographs.

Chief inhabitants of Cocos are hermit crabs, wild pigs, deer, and small lizards; there are also many tropical birds. Fishing is excellent but sharks up to six feet in length infest the waters surrounding the island.

Rising above the rocks on the shore of Chatham Bay stands the ground plane antenna used by TI9MHB for 40-meter operation. The antenna remained erect despite merciless pounding by waves.

# How's DX?

CONDUCTED BY ROD NEWKIRK,\* W9BRD

## How:

When the hounds of spring are on winter's traces . . . goes the first stanza of the Wouff Hong Song, the hallowed club anthem of our beloved DXHPDS (DX Hoggery and Poetry Depreciation Society). We swiped that from Swinburne because we know he referred to DX hounds in particular and because we, too, congregate annually around this time. Yes, indeed, a goodly crowd was there!

It was put up to Great Circles Root to get the show on the road after the first round of Old Haywire began radiating. This he did with a lilt-ing lament to the late QSL file of one bright boy who didn't believe in DXCC's "DX insurance":

"Two-fifty confirmed," claimed O'Squire  
Who dared them to call him a liar,  
"Send in, men? What for?  
I'll wait till I've more!"  
You guessed it: O'Squire had a fire.

Slickrig Toppenbottom followed Circles to the rostrum with a blast directed at schizophrenic DX stations who advocate operating procedures they themselves negate:

This rare one bleats out in great heat:  
"Spread out! Spread out or I'll squeet!"  
So we move for the jerk  
And who does he work?  
The lid who remains zero-beat.

Then Owlbait Ostrowski limned in rhyme the impressive ingenuity of 100,000 McScrees, a bird who tallies his DX score in terms of kilocountries:

"The rules are all wrong!" cried McScrees  
Whose Slobovian card was n.g.,  
So he made his own list  
And there's nothing he missed —  
All stations are countries, you see.

The next ration of ridicule, delivered by Feeders N. Twining, was dedicated to that small pack of watt-mad megacyclic megalomaniacs who erroneously visualize themselves as ham-band Voices of America:

When Two-Gallon Mossbrain dropped dead  
We found nary a tear being shed.  
For Hamdom, no loss —  
Such input made Moss  
Just a bootleg commercial, instead.

W6MUR, the sole out-of-towner to brave the vicissitudes of this year's DXHPDS powwow, then rose to the occasion with a tongue-in-cheek salute to all purveyors of scuttlebutt DXpeditionary sensationalisms:

One rare catch popped up "in Albania,"  
And another "in West Transylvania";  
The grapevine went mad  
But the outcome was sad . . .

\* New Mailing Address: Effective immediately, please mail all reports of DX activity to DX Editor Newkirk's new address: 4128 North Tripp Ave., Chicago 41, Illinois.

You'll have to finish that last one yourselves, gang, for Bill's punch line was drowned out by commotion in the rear of the hall. A flying squad of our sworn adversaries from the Euphemistic Order of DXpurgators barged in and broke up our gathering with tear gas, cherry bombs, and a shower of leaflets labeled, "It's Only a Hobby, Fellows."

## What:

And what a hobby! (They laughed and laughed when little Elmer said he was going up into his attic to chat with the U. S. Undersecretary of State and the King of Nepal. They didn't know that Elmer was a ham.) But that is neither here nor there. Before we tackle our monthly "How's" Bandwagon we should remind you that

In the text to follow, frequencies (given in number of kc, above the lower band-limit) appear in parentheses, times without. E.g., (9) = 14,009 kc. If the paragraph deals with 20-meter work, times are GMT, using the nearest whole-hour figure such as 7 for 0720 or 0650, 0 for 0015 or 2349. As a rule each DX call is mentioned but once per band.

20 c.w. gets us off to a flying start. The swing from winter to summer conditions gives 14 Mc, a capricious turn but W9HIZ swapped salutations with CRs 5JB (45), 7CN (68) 14, EA 91F (88) 21, 0AB (65) 22, FB8BR (68) 18-19, FG7NB (78) 17-18, KT1UX (40) 22, Jan Mayen's LB1LF (21) 14, LZ1KSA (1) 15, a VQ8 and 3VBAB (46) 21 . . . . An FB8, KM6AX and VQ5EK (67) 19 worked W8Y1N. . . . W4AUL met up with ET3GB (8) 20-21, FASCR (10) 19, FY7YE (48-67) 18-20, HK0AI (55-112) 8) 20-21, SV1SP (19) 18-20 and a Rio de Oro EA9. Some time back John retired from the DX racket after reaching 107 confirmed but, "By chance one day I happened to tune over 20 and, brother, that did it — I'm gone, but gone, again!" . . . . W4TFB made away with CR6CJ 20, EA6AF (52) 13-18 of the Balearics, an FY7, GD3UB 12, HA5KBA (75) 16-19, an SV1, 4X4BX (90) 17, 934AB 18 and W4DGW ZD4 22 in Takoradi harbor . . . . K2BZT caught ET3S (62-75) 14-22, F1QV FC (50) 15, GD3s HPN 1BQ (50) 19-20, HA 5KBB (62) 18, 7KLD (70) 18, HE9LAA (62) 19, I1BLF, Trieste (49) 13, JA 3AB 3AF 4BB 6HK, KA 2USA 7DM, SP 3KAU

(30) 15, 5AA (10) 17, 8KAF (62) 16, 9KAS (68) 16, ST2AR, TA3US (50) 13-21, VQ2HR, YO3RF, 4X4BT (82) 19 and 9S4AX (1) 17. Nice haul! . . . . . CR5AF, F08AB (64), MP4QAL (65) 15, OY7ML (5), PJ2BA of Bonaire Isle, PZ1QM (20) 23-0, ZDs 6BX (80) 14 and 8AA (3-60) 18-23 of Ascension chatted with W4QCW of KC4AB fame . . . . . W5UUK put his hooks into CE0AD (20) 2-3 of Easter Isle, CR7AD, an EA0, EA8BF (42) 0, an ET3, HH5SS (25) 0, SPs 3AN 9KAD (60) 14, a VK1 and ZB2A (15-31) 12-20. . . . . CS3AC (55), GC2FZC (35), LZ1KAB (80) and VQ2JN (50) came back to W9IHN . . . . . W3UXX cornered FP8AP (74) 18, FM7WP, EA6AU, EL5B, ILYCG/Trieste, IT1TAI, KG4AO, SP5AA, VP3VN, 5A2TZ and one 3A2AF (10-30) 12-15 who is reported by many other contributors . . . . . ET3LF (38) 20, MP4QAH 17, VSs 6CU 12 and 9GV 17 contacted DL4ZC . . . . . A rundown of results at random shacks, W2GYZ: ZDS, long-path KC6HX (40) of Mays Island, Carolines, W20LU: ZB1JRK (35) 20, W2QBB: CR7AN (26) 21, K2EUN: many Europeans, an EA9 and FP8AP with a 15-watt 6L6 c.c.o. W3AXT: ET3, FP8AQ, FG7, LU6SA of rare La Rioja, W3TFV: FASRJ, TF3NA, YV5s BJ DE, W4PVD: CR71Z 13, OY2Z 9, VQ6LQ 14, W6OWD/L: IIBNU/Trieste, SP6WF, TF3KG (70) 20, YU5 1GC (70) 16, 1GH (10) 18, W6UED: DU7SV (89) 1, JA1CR, KA20J, VPSBD of Grahamland, W8KAK: EA9AP (2-52) 18-19, FY7, KR6LJ for 1st Asian, W0VFM: OX3PW 17, VQ4FM 21, St. Martin's PJ2MA, KL7BBY: CE7ZJ near his antipode, a DU, ship SM8CW in mid-Pacific . . . . . ZD3A (6) 21-22 is a new Gambian reported at W5ASG down Arkansas way . . . . . So, Calif. DX Club's *Bulletin* specifies c.w. 14-megacyclers CE7AA (50) 3, FE8AE, FL8AI (150) 16-17, FR7ZA (19) 16-17, HI8EW (65), MP4QAJ (60) 15, SV0WL (53) 15, one VQ1RY (20) 0, YA2AA (17), YS1O (30) 14-15 and many others . . . . . West Gulf DX Club's *DX Bulletin* fills us in on CE7s BS (35) 1, ZT (82) 40, CN2AD (55) 20, CRs 4AL (20) 11, 6AI (62) 20, 6AR (30) 20, 6BP (110) 22, 6CZ (38) 20, CT3AB (10) 18, EA0AC (8) 5, EL2L (69) 17, F9YP/FC (40) 17, FD8AA (10) 15-18, FF8s AJ (100) 21, AP (50) 13, BB (60) 18, MM (81) 18, FQ8s AK (59-95) 22, AU (89) 20, HB1MX/HE (70) 0-1, HH3DL (13) 22, one HV1ZZ (167) 14, HZ1HZ (15) 16, KR6s KS (8) 1, LF (90) 14, LUs IZV (78) 1, 5ZF (20) 2-3, MB9BJ (30-50) 13-19, MP4BBS (30) 15, OD5LX, SV0WT (30) 13, TF3s AB (17) 0, MB (45) 22, UA3KP (73) 12, UR2KAA (86) 13, VK9OK, VQs 2GW (25) 20, 3FN (89) 21, VR3A (75) 21-0, VS9AS (7) 20, VU2CP (52) 13, ZBs 1LU (34) 18, 2I (12) 21, ZDs 2DCP (30) 20, 4BM (63) 19, 6EF (90) 19-21, ZE3JL (14) 19, ZP3AY (100) 23, ZS3P (64) 18-19, 5As 3TR (57) 15, 4TK (12) 15, 4TO (67) 15 and Netherlands New Guinea's JZ0AG (70) 14-15.

**20** 'phone brooks booming business of late, W4QCW is quite satisfied with the likes of F9YP/FC, GD3IBQ, HI6EC (175), HK0AI (130) 22, KS4AW (180) 22, KT1UX,

PJ2MA, SV0WO, VPs 1OJS 5AE (148) 9, ZB1AJX, ZD3BFC (138) 15 and 3V8BP . . . . . CR6BX (99-113) 23, EL2X (112) 22, GD3ENK (190), ZD4BR (115), ZE2KR (105-120) 0 and 5A1TA (185) set well with W9HUZ . . . . . OD5AB and VP8AO got away from W2GBC but CR6CK, CT2AG, CT3AE, EAs 8AI 8AX 9AR (140), FP8AP, HC8GI (110) 18-19, HH2LR, KA3RR, KT1s LU WX, M1B (100) 0, OE13USA, PJ2AF, TG9MB, VPs 1AB (157) 0, 2DA 2DN 2KM 7NX, VQs 2DT (130) 22-23, 4FQ, YN4CB (120) 14-15, YS1MS, YU1GM, ZBs 1S 2A (105-130) and 5A2CL didn't. . . . . W4CBQ puts his hard-to-remember school French to good use in running down French Colonial 43ers, ET2XX (182), FQ8AD, an FP8, OD5 and SV0 boost Bob to Rung No. 112. . . . . Radio-telephone doings here and there, at K2BZT: VQ4RF (120) 20-21, W3AXT: FG7XB, W5UUK: FM7WN (129), HK0, VQ2, W6UED: HC1ER, TG9 . . . . . CS3AC (190) 14, EAs 8BA (130), 9DF (116) 17, FD8AA (172) 18, FM7s WF (120) 23, WQ (110-150) 23, FQ8AB (290) 12, FY7YE (115) 13, GC6FQ (128) 20, HB1MX/HE (103) 13, HR1CB (150) 14, KC6s AI (202), CG (245), LB1LF (21) of Jan Mayen Isle, VP8AQ (106) 1, VQs 4FK (125) 20, 5EK (150), VR3A (122) 14, VS1FS (142) 14, XZ2ST 14, Y12AM (163) 15, YO3RF (135) 16, ZDs 1DK (135) 20, 4BF (120) 23, 6AH (130) 16, 3V8BL (150-172) 21 and 4X4XD (290) 18 are stalked by WGDXC sleuths . . . . . SCDXC headhunters are after KP6AK (218) 2, OK1MB (185), VK9s RH (143), RM (145), VPs 2DA (130), 2GW (156) 23, VQs 5BVF (183) 22, 8CB (113) 21, VR6AC (352) 1, ZC3AC (293) 0, ZP5CF (130) 16, Marion Island's ZS2MI (105) and 9S4BS (110) . . . . . Newark News Radio Club monitors picked up 14-Mc. radiotelephones CN2AD, CN8s EM IE MM TY 17, CRs 5AC 21, 5NC 6AT 6CB 6CJ, CTs 2AF 3AB, EAs 8BQ 9BC, EL9A, ET2US, FAs 3GZ SCC (195), FB8XX, FF8BB, FL8BC, FQ8s AC AK 22, HKs 3PC 4BD (165), IIBNU/Trieste (215), JA4BB, KAs 2NA 3RR 7BG 7GM 8RK, KC6AB, KGs 4AO 4AP 6FAA, KR6AZ, KV4BB, LX1BU, OQs 5EI 22, 5FM (157) 20, 5GH 6DZ, OH9OC of Lapland, PJ2s CE CH (140), ST2s GB 20, NW, SV8s WK 20, WS, TA3US, TF3MB, TG9AI, VPs 1GG 2VA 7NG 7NN, VQs 2FU 3EZ 4AA 4AQ 21, SAR 20, VSs 4HK 9GV, YAI2T 20, Y12DIQ, YNs 1LB (135), 4DP (135), YU1AD, ZC4AA, ZD2FHW, ZEs 3JY 5J1, ZM6AT 0, ZSs 3E 8I, 3V8AS, 4X4BR, 5As 2TS 2TZ and 3TE (195) 20.

**40** c.w. now is more selective because of roving thunderstorms. For instance, a patch of QRN over New York City may be a big break for Connecticut and southern New Jersey DXers—less competition. Anyway, here's W4TFB's 7-Mc. bag: CR7s CI (5) 5, CN (8) 5, EL2X 7, FAs 8DA 6, 8RJ 7, 9RW 7, KC6CG (10) 11, LU9ZE 8, OQ5RU (12) 5 and YU2HG 6—it's 118/89 for Don and DXCC won't be long now. . . . . EA9AP (25), Biak's JZ0DN (34), LU4ZI (10), OX3AY (3) and a VR1 fattened the swag at W9HUZ . . . . . CE3DZ, DU7SV, HK4s BD (25) 7, DP (45) 0, JAs 1CR 1VE 1VX 4BB 6BO, a JZ0

CN8ML emits a fat Casablanca signal on 14- and 21-Mc. 'phone with Panda and Bendix gear, uses a Collins receiver and a pair of rotary beams. Operator Richard Keel comes from a DX family; a brother and cousin are HB9s PU and P, respectively. When you've worked all three stations you are eligible for the WAK certificate issued by CN8ML—Worked All Keels.

SM5RM of Stockholm can give linguistically-inclined DXers workouts in fluent English, German, French, Spanish, Italian and three Scandinavian languages. Olif runs 150 watts on several DX bands, is building a 500-watt final amplifier, owns a printing business and has been hamming for 30 years. (Photo via W9TRD)

VK9RM recently moved from Lae to Wau, New Guinea, and here he is getting acquainted with his new neighbors. Gainsaying last month's Jeeves episode, Peter reports these local dandies as quite hail fellows well met.

and KC6 contacted W6UED. . . . W5UUK does okay on 40: CR6AI (8) 4, EAs 8BF 9DF (15) 6, FR7ZA, OQ5s CP (6) 4, GU (5) 6, a TI9 and ZS3K were worked. . . . CR7CO, CX6AD, LU9UH of Province Eva Peron (a rare one for RCA's awards) and ZS1HX (22) 5 grace W3AXT's ledger. . . . CN8EB, GC3KAV, HH3DL (48) 6, KG4s AO and AV made the grade with W3WPG who finds 40 hottest between 4 and 6 on the GMT chronometer. . . . W1ORP picked off ZC4XP (37) 22, ZE5JA, 3V8AB and 4X4BR without much difficulty. . . . An EA9, KG4AJ, KV4AA and YU2AE swapped c.w. with WIAPA who finds 7-Mc. c.w. a cinch compared with his usual 40-'phone DX pastime. . . . W4CAY captured JAs 1KM 7BO 9CQ (not two), a JZ0, KC6 and long-haul VK6SA. . . . Now, samples of 40-meter code luck around the circuit, at W2GVZ: HK9AI (39) 4, W2QBB: TF3MB (8) 0, YVIAD (32) 0, K2BZT: IIBNU/Trieste. K2EUN: with 15 watts, KH6IJ, CO8AQ, FAS, OKIAEH, YU1FC 22 answered K2GZN. K2JKA: HC4MK, H113, W3TYW: IIBLF/Trieste, VP4BN, W4QCF: OX3, TI9, ST2AR (10) 2, W5ZAK: OX3BE, K6EBH: DU7, JAGAD, K6EYI: JAs 1CP 3FJ, W7UWS: JA3AB, KL7s AWW FAK, W3YJB: OX3AY, TF3NM, W6VFM: Zss, VPs 6AM 7NM 10, DL4ZC: HK3DM. . . . 40-c.w. candidates DU18S (21) 13-14, EAs 6AF (30) 3, 9AP (50) 6, FM7WD (23) 5, FY8AA (0) 5, HA5KBA (5) 7, JA0WH (12) 13, KD6AT (17) 12, KR6OY (18) 12, KT1UX (40) 2, LU8ZC (10) 5, PJ2s AA (13) 3, AN (6) 3, UA0KKB (21) 13-14, VP8s AU (40) 5, B11 (8) 2, VQs 4AQ (4) 5, 5EL (2) 3-4, 8CB (20) 13, VR2CG (27) 7, YSIO (17) 12-13, YV1EV (5) 3 and YU3CB (7) 3 are specified by WGDNC. . . . SCDXC adds CN8MIG (12), FG7XB (10) 3-4, FF8JK (18) and VQ2HR (15) to this prefix pudding. . . . Novice doings on the 40-meter DX tangent are unheralded but not uncommon. WN3ZKH hooked CO2GU, VP6KL, W4FHI V06 and WP4AAQ, plus 45 states. KN2JKC knocked off CM7JA, CO2BL and DL1FF on 7188 kc. WSRGF 2 heard ZL3GQ calling WN5FQR and other unsuspecting WNs around 7178 kc, at 0830 GMT. Other DX stations appear to get a bang from thrilling the WN/JN 7-Mc. gang so you Novices had better pass up no weak signals!

**40** 'phone DX work attracts but a hardy few. WIAPA has what it takes, and it takes plenty. Gil collected CM2ZZ (193) 13, COs 2NT (186) 12, SLS (210) 14, HH2s JL (194) 12, RM (120) 11, KG4s AG (255) 12, AJ (208) 6, AV (207) 2, KH6s AGB (215) 11, AUB (210) 11, KV4BK (210) 11, PJ2AF (223) 11, PY2AGR (265) 3, TI2GC (194-250) 12-13, TG9VS (206) 11, VPs 10JF (300) 4, 2GW (200), 2LN (120) 12, 4TI (193) 12, 6JR (220) 11, 6KL (192) 12, 9BO (120) 12, 9BL (175) 12 and VK3ATN (100) 12. . . . NNRC ears switched over 7-Mc. voices CTs 1CL 3AE, DU7SV, EAs 8AX 8BQ 9AS, EL2X (65), HH2s 1A PL, H16EC, HK9AI, HP3s FL OJ, HR1JB, JA2CT, KG6GX, KL7BBK, LU's a-plenty, PYs likewise, KJ6FAA, TG9BG (190), VPs 2DN 6FO 6WR 9L, Tasmanian VK7WA, YN4CB (70), ZLs galore and ZSI PM.

**80** c.w. has forty's atmospherics-selectivity in no-trump and times ten. Stronghearts hold fast on 3.5 Mc., however, and doubtless there will be considerable DX worked by the W/K gang right through the hot months. DU7SV (20) 13, EL2X (12) 5-6, GD3UB (6) 0-1, HA5KBA (12) 1, HB1MX/HE (2) 5 and ZD2DCP (6) 6-7 contacted W9HUZ. . . . EA0AE and H18EW (9) carried W4BRB to the 80-meter 117-country mark. . . . W5UUK gassed with an EL2, HK4DP, KL7PI, KM6AX, TI2s BX and PZ. . . . W3AXT concentrated on CTs 1UX 2BO 2, 3AB (18), EA8BP 2, FA9s RW RZ (10) 7, FP8AP, LU2GB, LZ1KAA, OE5JK, PY6FI, VP7NG and ZS2A. . . . Eighty good DX fortune at this shack and that, at W21VS: VP7NX (5) 5, ZB1BF, W2LPV: FA9, KV4AA, OK2DG, K2BZT: FPs, KT1UX, OE2JG, K2HZR: HZ1HZ,

SP9KAD, YU1AD, 9S4AX, W4TFB: FASDA, W6NJU: KR6LJ, XE2OK, H8YTA: KM6 VP7 ZS 984, W9UDK: XE1OE, ZLs 1BY 3GQ, W0VFM: KH4 KH6 KV4, DL4ZC: Ws 21HF 4CDC. . . . WGDNC and SCDXC list 3.5-Mc. radiotelegraphers FF8AR (13), GD3IBQ 0, HK1BD (17) 7, HA5KK 4, JAs 1CJ (5), SAH (18), LASRB 8, LZ1KDP 6, OE3SE 4, PJ2AA 4, PY5EK 3, UA9DH, UB5CF, VK7KM 12, VP8BD 2, YU2AEF and ZB2A 4.

**15** 'phone is the preferred playground of numerous DX chasers these days and W6ZZ confirms the reason why: CE3 3H 6AB, HC1s FK FS, HP3FL, KA's 2KC SRK, KG4AR, KL7s AN BFW BGG CC, KM6AX, KV4BD, VP5AE of Turks, VQ2s DT FC, YV3FL, ZL1s BY 1MQ, ZS6s CV ZO and ZP5IB. Miles also collected ten more MMs on 21-Mc. A3. . . . HK3DP and PJ2AR were new 15-meter countries for W6NJU. . . . W4DOC now has 80 countries on 21 Mc. thanks to CT3AE, FA3OA, H16EC, OQ5RU, YS1RA and others. . . . Still searching for an Asian, W4UWC reached the 72-country mark on fifteen by way of TG9CR, VP3YG, a VQ2, VP8AQ of the So. Orkneys and ZB1AJ; six weeks on 21-Mc. 'phone furnished 67 countries for 10-meter specialist W4NQM. . . . Fifteen-A3 desiderata here and there, at W1HDD: VP1GG, W3TYW: HC1PL, KH6s, W6UED: HC1, KG6GX, OA5G, W6XJU: DU7SV, KA2KC, VKs, ZLs and VR2CG. . . . 21-Mc. 'phones reported by NNRC: CN8CS, CP5EP (220), EA0AC, EL2X, GDs 3ENK 61A, KV4BI, OA5E, OQ5VP 20, PJ2AO, VP8AZ, VQ4AR, YV5BV, ZE2KR 21, sundry ZLs, 3V8BP and 4X4DK.

**15** c.w. got a play, too, and even the Novice gang bestirred their DX bones. WN3ZKH scored with FAs DA RJ, Gs 210 3DCU, GM3GJB and KZ5DM while WN7WS provided Utah for TI9MHB's Novice-band WAS effort. . . . EA6AF (75), IIBLF Trieste (67), KT1UX (10), ZB2A (15) and ZS3K (100) waggled keys with W9HUZ. . . . W3TYW assembled a pile of Europeans while W7VWS consorted with several KH6s, KL7CGA, XE2OK and ZL1BY. . . . ZEs 3JP and 5JJ came back to W5UUK. . . . DL4ZC worked OA4ED, HZ1HZ and a ZS5 without fuss or bother. . . . WGDNC got the fifteen-A1 goods on AP2K, CE3AG (1) 18, CR6AI (33) 18, FAs SCR (20) 16, 9RW (20) 17, FF8AJ (30) 16, FR7ZA (180), FY7YC (75) 20, HK4DP (2) 18, VP7NX (40) 17, VQ2GW (30) 16, ZDs 6BX (50) 17, 9AC, ZS3K (100) 19, 3V8s AP AX BL and BP.

**10** 'phone and c.w. received narcotic shots in their ionospheric arms or else the ARRL DX Test deserves the credit. Anyhow, a few mailbag missives have favorable comments concerning the 28-Mc. range. W6NJU worked A3 with LUs 7BQ 7QB 8FAO, KH6AFS and TI2BX. . . . ZS3E was a welcomed 10-meter customer at WSYIN around 28,320 kc. . . . W1WXC recommends present-day 10-meter work for DXers who like to dig for 'em and reports W1s HJB LSZ ONK QNC UQW and YWU enjoying this strenuous sport. W1WXC ran down CR6BX, CXs 3AA 7BA, HC1MB, KZ5s, KV4BI, LUs 4AAR 4DZI 8AM, TI3LA, VPs 1GG and 2KM on voice.

**160** c.w. activities may be in the post-mortem stage for most participants in the past season's doings but you'd better keep an ear on this band. It's a tricky one!

The North American path fizzled out somewhat to make European pickings slim but several South American folk turned up to enliven recent 1.8-Mc. soires. YV5s DE FH and HK4DP worked a flock of W/K brethren; W1s BB and ZL, in that order, were among the first to nab the Colombian. YV5FH's performance was topped with a smooth W0NWX 'phone QSO. . . . W1BB understands that W2SKE was the only North American to put a consistent

The pile-ups inspired by Burma's XZ2OM are all out of proportion to the mere 25 watts Mike runs to a 3-stage 807 rig on 7-, 14- and 21-Mc. 'phone and c.w. Dipoles radiate on 40 and 20, a ground-plane on 15, and an AR-88 receives. XZ2OM was in there pitching during this year's ARRL DX Test although his reception was hampered by unusually severe KA, KR6 and KG6 interference.

signal into Europe on 160 during the ARRL Test, A3 section. . . . W6KIP/6, strongly abetted by W8GDQ, continues his efforts to work VS6CQ on one-sixty and results to date feature a W6KIP/6-VS6CQ crossband contact on 160-40 meters. The perseverance of W6KIP/6 deserves plaudits inasmuch as he persists in the face of East Coast success with European and African DX, listening to people working stuff he can't quite pull through out his way. It certainly would be some form of poetic justice if W6KIP/6 succeeded in making the grade with VS6CQ. This will be a very fancy 160-meter QSO! . . . . T19MHB's 1.8-Mc. activity boosted the top-band countries totals of Ws 3E1S 9F1M 9PNE and many others. KH61J and KL7TM appeared on the band; KG4AB and XE2OK showed up during the Test to swell the list of near-but-rare 160-meter countries available. . . . We close the Bandwagon on a sad note this month with word of the passing of outstanding 160-meter DX specialist VE1EA. Clarry, along with G5BY and W1BB, pioneered the annual Transatlantic Tests in the years before WW-II. VE1EA, you will recall, scored the first recorded North America-Asia QSO (with HZ1KE) in January of 1951.

## Where:

XZ2OM confirms that all XZ2-bound QSLs can be sent via Box 611 or Box 367, Rangoon, Burma. Mike adds, "I will do my best to [help] any station needing an XZ2 QSL. Full QSO information is required, together with IRCs, and cards will arrive direct." . . . . W2GT emphasizes that FG7XB does not receive QSLs via Box 11, Pointe-a-Pitre. Use this address only: 44 Chemin des Petites Abymes, same town. Antoine, who started out QSLing upon QSO, rapidly is becoming disillusioned with that approach; we have on hand his list of prominent DXers who as yet haven't bothered to answer his cards. . . . As previously noted, a new slate of VK1s is active from Australian outposts on Macquarie and at Mawson Base, Antarctica. In lieu of other addresses they can be QSL'd via W1A. W1OJR reports fast response from VK4FJ on behalf of VK1EG if IRCs are sent. Along this same line, when you seek to do business with other good Samaritans helping out rare DX stations with

QSL problems, by all means cooperate fully by sending self-addressed envelopes plus postage or IRCs where necessary. It's more than enough that such agents contribute time and effort without incurring monetary expense as well. . . . U. S. QSLs for QSOs (over 300) with PJ2MA (PJ2AA) on St. Martin Island can be shipped via W1PST, but all non-U. S. amateurs should QSL direct to PJ2AA. . . . Don't look now but scattered U.S.S.R. QSLs are sliding through QSL bureaus once more. . . . Periodically we caution newcomer DXers to QSL DX stations via foreign radio-society bureaus only when instructed to do so by stations worked, or when so noted in this column. Unlike your ARRL QSL Bureau, which handles cards for ARRL members and nonmembers alike, many overseas societies make their bureau facilities available for members only. QSLs they receive for nonmembers may be returned, pigeonholed or destroyed. So, when you work a flock of stations in Outer Baldonia don't just drop your QSLs into an envelope and ship the lot to the Outer Baldonian Radio Society QSL Bureau. That could be an excellent way to guarantee yourself a rockbottom QSL-returns percentage! Another thing: Unless exception is noted in this column, do not mail foreign-bound QSLs to the ARRL QSL Bureau. Your League bureau is chartered only for the distribution of QSLs incoming from overseas and foreign sources. . . . The accuracy of the individual items to follow is by no means guaranteed, nor are they in any case necessarily "official." Garnered mainly from third-party sources, they are published here in the hope that they may assist someone to a fast QSL or two. W1s APA RDV UED WPO, W2s BBK GT OLU, K2JCS, W4s AUL CBQ QCW TFB, W5UUK, W6ZZ, W8s KAK Y1N, W9s CFT UE TRD, W0VFM, F7ER, EDR, OVSF, NNRC, NCDXC, SCDXC, WGDXC and W1A deserve your gratitude for these:

Bellringer, G3JYF, 14 Green Lane, Redruth, Cornwall, England ..... ex-**ZS1RG** (QSL to G6UT) ..... **3V8BL**, Box 747, Tunis, Tunisia ..... **457YL** (QSL via W5EFC).

## Whence:

**Asia** — From the pen of Asian airman XZ2OM: "Regarding W DX, W6s frequently are heard, but very few W1s and W0s. VE/VOs are so rare I wonder if they are on the air!" Mike lists XZ2s EM KN ST and SY as other currently active Burnese amateurs ..... **HZ1AB** reports a surprising lack of W5 W6 and W7 signals during the ARRL DX Test but other U. S. call areas were breaking through consistently. Ron has trouble loading some of the various antennae he rigs up, for the **HZ1AB** stock of antenna-coupler components is quite limited ..... Japan's International DX League lost its headquarters by fire but pluckily plugs on. **IDXL** issues several DX certificate awards that may be of interest to wallpaper hunters. For information on same write the organization at Box 56, Central P. O., Kyoto ..... An intriguing tidbit from the pages of *Zero-Beat*, organ of the Hampden County (Conn.) Radio Association: "W1YCG hopes to operate from Afghanistan if permission can be obtained. Will be using a Viking Adventurer for both c.w. and 'phone. Start listening around July 1st." ..... **WGDXC** Asiatic gleanings: **G3FQX** heads for a ZC4 session. . . . **V89XZ** has been operated by ex-**SU5XZ**. . . . **MP4BBS** (G8RP) does shipboard hamming off Bahrain island with a BC-610.

**Africa** — After six months at the key of **ZS1RG**, **G6UT** finds 100-plus ARRL DXCC List countries in his log. **OT** St. Johnston now is back in the U. K. picking up where he left off on the **G6UT** DX trail ..... **W7PCZ** was **EL2X**'s 48th state after a year of WAS effort. **EL2X** now has a DX tally close to the 200-country mark ..... **EL5B** (ex-**DL3WH**) finds the fishin' easier with his present call sign, although he did all right in Germany, too ..... There are gratifying signs that Egypt is taking a more tolerant view toward amateur radio. Several official licenses now appear to exist ..... **CNSML**, a Swiss in Morocco, especially likes to rag-chew with W4s because he spent considerable time in Floridian environments ..... Club African comments, *SCDAC*: One **ZD3ES** soon should be available. . . . **FL8AI** often is heard by **EL2X** but no answers result. *WGDXC*: **F8SAE**'s inactivity is the result of illness but **Marcel** still had hopes of doing 100-watt business on several DX bands before leaving the Roons.

**Oceania** — No U. S. amateur yet has collected the **NZART** (New Zealand) **WAZL** award. **G6BS** turned the trick, though, so it is possible. **W0TUB** stands ready to provide information on **WAZL** and all interested North American DXers are invited to apply ..... The scarcity of VK2s in the 1955 ARRL DX Test was caused by serious New South Wales flood conditions, the worst in recent years. Most VK2s on the air at that time were **QRL** pushing emergency traffic on **W1A**'s emergency nets. **VK2W1** was **NCS** on 3525 and 7050 kc. Favorable newspaper publicity resulted from a communications task well done ..... **Pago Pago**'s **KS6AB** is being coaxed back to 20 from his 80-meter hideout by **WGDXC** cohorts.

**Europe** — Yank-in-Yugoslavia **YU1GM** reports bagging his 100th country. "Am not faring so well in the conformation department but have caught up on my own QSLing now and am keeping it current. Those who have not received cards will eventually get them as most went through bureaus. I have worked nearly 2000 W stations and shall be switching to 15 and 10 meters as conditions improve." The **YU1GM** address appearing in this month's "Where" promises faster results than **Bob**'s old via-APO listing ..... **ZB1JRK**, slated to remain in Malta until August, punches out a big 25-watt signal by virtue of a 650-foot long-wire, as noted by **W2OLU**. **ZB1DM** closed station for return to New England. . . . Albanian and Vatican State continue to be the object of *Dxpeditary* intentions by several well-known DXers, but so far not so good ..... Another trophy for diploma-hunters: **W4YUR** (Worked All Yugoslav Republics). **W1UED**, who spotted it, suggests those interested write the sponsoring organization, Savez Radiomatera Jugoslavije, Trg. Republike 3/IV, Belgrade, Yugoslavia ..... **W4CBQ** has it that **SV0WU** shortly will be heard from Rhodes ..... European club diggings,

**NCDXC**: Never lose heart — **W6TT** just received a **QSL** for a 1930 QSO with **SM6SB**. **TT** was **CAZ** in those days. *WGDXC*: Over 1500 **QSLs**, 1000 from W/Ks, have been received by Monaco authorities as a result of phoney 3A2 activity. . . . Write **UBA** (Belgium), Post Box 634, Brussels, for information on their new **WABP** (Worked All Belgian Provinces) DX award. . . . **ZB2s** I M and O are current Gibraltar actives.

**South America** — When you burn up your only plate transformer in British Guiana you go off the air for a while until you (1) get it rewound, or (2) scrounge another. **W0VFM** reports such a revolting development at **VP3VN** who normally runs 40 watts to an 807 on several bands, receiving with an **HQ-120**. No surplus counters or supply houses down Georgetown way ..... **FY7YE** closed in on the 3000-Ws milestone and has developed quite a **QSL** backlog. But thanks to **W4ML** and others, Mario's pasteboard problem rapidly nears solution ..... *WGDXC* sources find that **HC8GI** of the Galapagos, a retired Chicagoan, settled in the islands with an 18-watt Harvey-Wells exhaler, a couple of dipoles and an **XYL**.

**Hereabouts** — **VP1GG**, due for **QRT** shortly, hopes to appear next from **VR2** environs. **W1HDQ** hears he'll be taking a ham-band vacation until around November ..... **VP2VA**, host to **W2BBK**'s recent **FPSAK/VP2** **DNeursion**, is a retired British engineer down British Virgin Islands way. Ivan knows no c.w. but gets great kicks from 20- and 75-meter 'phone operation. **VP2VA**'s home is powered by a battery Windcharger set-up while his ham gear runs off a 1.5-kw. 110-volt generator. . . . **W0BAF** contributes a brilliant color shot of his 100 hard-earned **DXCC** **QSLs** which causes Jeeves to wonder: What is more colorfully impressive than a large display of DX pasteboards? ..... **ADXC** (Alaskan DX Certificate) is a new one issued by the Anchorage Amateur Radio Club, P. O. Box

"Hungarian headquarters station" **HA5KBA** has logged about 3000 **QSOs** since activating in October of last year. Its staff of several operators is hunting for the last few states needed for **WAS** and has worked well over 100 ARRL **DXCC** Countries List items. Chief op "Bandi," **HA5BM**, put this home-built equipment through fast paces during the 21st ARRL DX Competition recently concluded. **QSLs** for **HA5KBA** go via **W3ANT** who provided this photograph.

211, Anchorage, Alaska. Ten **KL7** confirmations, including at least one from each of the following Alaska areas, will do the job: southeastern Alaska (the area bounded by British Columbia), northern Alaska (the area north of the Arctic Circle), Aleutian Alaska (the Islands plus Kodiak), and central Alaska (what's left). Write **AARC** for complete rules ..... **OT** DXer **W4MIR** felt the nip of the DX Bug once more and reports similar awakenings in the shacks of local W4s **AIT** **CS** and **ZH**. **McSwindle** and **W2GVZ** were right! ..... **W1APA** observes that **KG4AG** is operated

LILLIAN M. SALTER, WIZJE, Administrative Aide

**Full Addresses and Proper Check Required on Originations.** Ever find yourself on the delivery end and unable to do the job? All amateurs (and MARS originators too) are asked not to permit amateur traffic to start on its way by radio *unless* it can carry an adequate address to insure delivery. Each handling station should have an understanding about the check or word count before receipting (QSL) for the message! The *newcomer* is urged to study all the concise information in the League's booklet *Operating an Amateur Radio Station* relating to checking, servicing and handling messages. It's part of the tradition of amateurs that they actually can communicate, and in a responsible manner. Both old and new timers may benefit by rereading W3ECP's "Net Know-How" in March *QST*.

But let's hear from Cy Read, W9AA, who takes up this matter with Hq.: "I am still running a full head of steam about the way messages are coming through. Some addresses are 'strictly from hunger.' In this case there was no one nearer, and the NCS asked me to mail it. In due time it came back marked 'unknown' whereupon I sent out a SVC. . . . It appeared that many of the traffic stations located in small towns or at great distances don't seem to realize that any message going into a big city must have a *complete and accurate address*, if it is to get through. Get the boys to understand and insist on a proper address on every message originated, and our service will be improved. Note the check on the original message doesn't agree with the text count. . . ."

The example Cy attached was a MARS origination (Hawaii). The principle of needing more address applies to many a U. S. A. amateur radiogram. Refile procedure is given in detail, page 130, June '53 *QST*. All amateurs should refuse to start messages unless they are complete and in standard ARRL form for amateur circuits. There are more amateur nets functioning effectively to get traffic through than *ever* before. Make texts concise, address complete, with a 'phone number where feasible, and operators *should* check them carefully as to destination. Haphazard and rubber-stamp originations generally impair more than they advance the amateur traffic reputation!

**How to Improve Your "Fist."** Sending at home on a code practice oscillator or buzzer *in step with tape-sent transmissions* is a good way that some are overlooking to improve one's sending. You can note from page 70 in this *QST*, the days when we send practice text from

*QST* if you wish to try this. Experienced amateurs concede it is much easier to copy at high speed than it is to send manually and *well* even at moderate speeds. Interspersed periods of sending practice are worth while, since they buck up the ability on the receiving side too.

Smoothness in sending requires good spacing and rhythm. Newcomers: to avoid having your sending fall into the category where TEST becomes "NST" and CQ becomes "NNQ" bear in mind that by copying tape (automatic) transmissions regularly with some time spent *sending* in step with the tape, such defects can be overcome. Code then becomes most enjoyable and effective for two-way communications.

**Country Considerations.** What makes a country in the ARRL Countries List? Not many DXers think much about this since the standard list for reference is reprinted up-to-date in *each* January *QST*, and put out in folder form. You can mark your countries as you work them, while collecting your 100 cards to submit for DXCC. Watch *DXCC Notes* headings in *QST* for any possible list changes; such are usually additions. "How's DX?" may give you additional facts about the presence or absence of signals or countries, also "where to find" the DX reported, documenting your kind assistance. The ARRL Countries List is a yardstick for DX, the standard for use in connection with the ARRL DX Competition and the DX Century Club. But we started to tell you what's behind the list in terms of country policy.

The League Communications Department is assigned the honor and responsibility for making operator certifications and awards. A standard published list assures uniformity, and one goal for all concerned to work toward, either contestwise or for countries credits. A group of experienced staff-member licensed amateurs assist the Communications Manager in arriving at decisions through discussion and analysis of operating problems requiring administrative review. On countries the "approach to the problem" may, we think, interest you.

There are three criteria on which facts are determined in approaching any countries problem: (1) Does the area have political independence? (2) Does it have adequate geographical separation from a parent nation? (3) Does it have foreign lands in between? Of course, whatever the list permits, it is the *same* for all working to the goal. But the reason respect for our list is general is, we think, because it is progressively kept up to date as governments change; also that

any modifications only follow League inquiry and precedents and consultation with authorities such as our U. S. Department of State, Webster's *Geographical Dictionary*, and Rand McNally.

The ARRL Countries List is the guide in determining what to send us in order to qualify for the ARRL DX Century Club award. It is available to members of the League on request; ask for Operating Aid No. 7.

— F. E. H.

## CODE-PRACTICE STATIONS

The following is an up-to-date list of all stations participating in the ARRL Code-Practice Program:

W1ACT, Fall River ARC, 57 Richmond St., Fall River, Mass.; 3545 kc.; Mon., Wed., Thurs. and Fri., 1900 EST; 5-7 w.p.m.

W1QZO, Harry Warner, 11 Berlin St., Wollaston, Mass.; 146.8 Mc.; Tues. through Sun., 1900 EST; 6-14 w.p.m.

W1SRB, Al Vesce, 84 N. Main St., Thompsonville, Conn.; 29.6 Mc.; Mon., Wed. and Fri., 1930 EST; beginner's speeds.

W2HIEI, William Teso, Mountain Ave., Hillburn, N. Y.; 3950 kc.; Sat. and Sun., 1400 EST; 5-18 w.p.m.

K2IBC, Avenel Radio Club by W2FSL, Adolph E. Elster, 53 Commercial Ave., Avenel, N. J.; 3675 kc.; Sat., Sun. and holidays, 0730 EST; beginner's speeds.

W2NRM, Howard B. Jack, 12 Beech St., Ramsey, N. J.; 29.118 Mc. and 1880 kc.; Mon. through Fri., 0715 EST; 29.118 Mc.; Mon. and Thurs., 2200 EST; 3-8-15 w.p.m.

W3KWH, Steel City Amateur Radio Club, R.D. 5, McMichael Rd., Pittsburgh 5, Pa.; 29.108 Mc.; Wed., 2000 EST; 5-13-25 w.p.m.

W3UYD, Walter C. Downes, R.D. 2, Box 328, Jeannette, Pa.; 3585 kc.; Sun. 0930 EST, Wed. 1830 EST; 5-15 w.p.m.

W3VEJ, James M. Alcorn, 207½ Longfellow St., Vandergrift, Pa.; 7150 kc.; Mon. and Wed., 1900 EST; 5-15 w.p.m.

W4RUR, for St. Petersburg Amateur Radio Club, E. J. Blatt, 538 16th Ave. So., St. Petersburg, Fla.; 28.05 Mc.; Mon. and Wed., 1900 EST; 6-22 w.p.m.

W4ZRII, Carlton R. Commander, 17 Joyce St., Mt. Pleasant, S. C.; 3700 kc.; Mon. through Fri., 1830 EST; 5-13 w.p.m.

W5JRV, for Galveston County Amateur Radio Club, Blanchard Boldman, 4802 Ave. Q½, Galveston, Tex.; 1882 kc.; Mon. and Fri., 1900 CST; 3-15 w.p.m.

W5USN, Dan Baird, W5SPZ, chief-in-charge, 8th Hqtrs. USNR Radio Station, Marconi Drive and Robert E. Lee Blvd., Route 3, New Orleans 24, La.; 7100 kc.; Mon. through Fri., 1230 CST, 15 w.p.m., 7100 and 3750 kc.; Fri. through Mon., 1930 CST, 15 w.p.m.

W6JZ, Ray Cornell, 909 Curtis St., Albany 6, Calif.; 3590 kc.; Mon. Wed. and Fri., 1830 PST, 5-25 w.p.m., 1920 PST, 35-45 w.p.m. (When needed, schedule maintained by W6EFD.)

K6USN, Cmdr. J. M. McCoy, 12th Naval District Reserve Electronics Stn., Bldg. 7, Treasure Island, San Francisco, Calif.; 3590 kc.; Tues. and Thurs., 1830 PST; 5-25 w.p.m.

K7FCV, Lyle B. Clemans, CWO USAF, MARS Base Dir., Davis-Monthan AFB, Tucson, Ariz.; 3825 kc.; Tues., 1830 MST; 8-20 w.p.m.

W7FWID, O. U. Tatso, 513 N. Central, Olympia, Wash.; 3646 kc.; Mon. through Fri., 1700 PST; 4-25 w.p.m.

W8MAI, Blossomland Amateur Radio Assn., c/o WSFGB, Dean Manley, R.F.D. 1, Box 147F, St. Joseph, Mich.; 1890 kc.; Mon. through Fri., 2000 EST; 5-20 w.p.m.

W9KLD, for Kankakee County Radio Club, Don Rockwell, 685 Rutledge Ave., Kankakee, Ill.; 1895 kc.; Mon. through Sun., 1900 CST; beginner's speeds.

W9NPC, for Fox River Radio League, Lewis R. Hill, 212 N. Evanslawn Ave., Aurora, Ill.; 1810 kc.; Mon. through Sat., 1900 CST; 5-20 w.p.m.

W9UIN, Joseph H. Kadlec, 1148 Ashland Ave., Evanston, Ill.; 7240 kc.; Sat. and Sun., 0800 CST; 5-7½ w.p.m.

W0EGQ, Bob McMullin, Route 1, Lehigh, Neb.; 3755 kc.; Mon. through Sun., 1800 CST; 5-13 w.p.m. with text from *The Braille Technical Press*. Same schedule alternated with W0LGG, Bertha V. Willis, 108 N. 19th St., Marshalltown, Iowa, with text from *QST*.

W0LQC, F. Bion McCurry, 1234 Stanford, Springfield, Mo.; 29.18 Mc.; Tues., 2130 CST; beginner's speeds.

W0ONF, for Se Kan Radio Club, Kenneth M. Parker, Box 141, Howard, Kansas; 3805.5 kc.; Mon., Wed. and Sat., 1730 CST; 3½-15 w.p.m.

W0QDF, W. H. DuBord, 10247 Midland, Overland, Mo.; 29.6 Mc.; Mon. and Wed., 2000 CST; Mon. 5-13 w.p.m., Wed. beginner's speeds.

W0SQE, Bill Heitritter, 1114½ Virginia St., Sioux City, Iowa; 3750 kc.; Mon. through Fri., 1600 CST; 5-13 w.p.m.

## FIELD DAY STATISTICS

By Roy T. Harmon, W0IUB

Field Day is the most important event of the year in amateur radio. It started in 1933 and has continued to the present day (except for the war years), and Field Day records should interest many hams. Americans seem to like records as incentives. The four-minute-mile hope kept track fans enthused for many years even though there were no milers around who could come close to it. Following this line of thought, I sat down with my *QST* back issues and figured out the postwar records for Field Day. I used numbers of contacts to determine winners, since multipliers and point systems have changed from time to time.

Some of the feats look almost impossible, while others seem like they could be beaten easily by concerted effort. One fact that surprised me was that so many of the records were set in 1949, 1950 and 1951. One would think that since Field Day popularity has always grown from year to year, all of the records would have been set in 1953 and 1954, but not so! The W6MBA mobile rig sure must be a corker, and W3JTK's outstanding work as single operator at home has stood unchallenged since 1949. And in 1951 eighty-seven ops participated at one club set-up; what a circus that must have been!

Here are the figures. Hope the hams around the country enjoy them.

<i>Simultaneous Transmitters</i>	<i>Most Contacts</i>	<i>Call Used By Club</i>	<i>Year</i>
1	594	W8BDA/8	1951
2	983	W3BES/3	1954
3	1151	W4KFC/4	1951
4	1425	W6PD/6	1951
5	1198	W4FU/4	1949
6	1434	W4FU/8	1953
7	1570	W4FU/8	1954
8	1593	W2GSA/2	1951
9	1911	W2GSA/2	1953
10	2065	W3FRY/3	1953
11	1255	W5SC/5	1954
12	1626	W1OC/1	1953

<i>Class of Competition</i>	<i>Most Contacts</i>	<i>Call</i>	<i>Year</i>
One transmitter (unit or individual), 1 op	301	W6EYH/6	1949
One transmitter (unit or individual), 2 ops	520	W6TSW/6	1953
Two transmitters (unit or individual), 2 ops	535	W6AOA/6	1951
Mobile, 1 op	277	W6MBA/6	1950
Mobile, multi-op	274	W6MBA/6	1951
Home rig on emergency power, 1 op	240	W1T1A	1952
Home rig on emergency power, multi-op	248	W2SZ	1953
Home rig on commercial mains, 1 op	406	W3JTK	1949
Home rig on commercial mains, multi-op	833	W4KFC/4	1954

<i>Year</i>	<i>Number of Participants</i>	<i>Number of Log Entries</i>
1946	1936	187
1947	2702	288
1948	4660	305
1949	4942	495
1950	5935	609
1951	6118	644
1952	6451	522

## A.R.R.L. ACTIVITIES CALENDAR

May 7th: CP Qualifying Run — W6OWP  
 May 12th: CP Qualifying Run — WIAW  
 June 3rd: CP Qualifying Run — W6OWP  
 June 11th-12th: V.H.F. QSO Party  
 June 17th: CP Qualifying Run — WIAW  
 June 25th-26th: ARRL Field Day  
 July 2nd: CP Qualifying Run — W6OWP  
 July 11th: CP Qualifying Run — WIAW  
 July 16th-17th: CD QSO Party (c.w.)  
 July 23rd-24th: CD QSO Party (phone)  
 Aug. 5th: CP Qualifying Run — W6OWP  
 Aug. 16th: CP Qualifying Run — WIAW  
 Sept. 3rd: CP Qualifying Run — W6OWP  
 Sept. 14th: CP Qualifying Run — WIAW

## CODE-PROFICIENCY PROGRAM

Twice each month special transmissions are made to enable you to qualify for the ARRL Code Proficiency Certificate. The next qualifying run from WIAW will be made on May 12th at 2130 EDST. Identical texts will be sent simultaneously by automatic transmitters on 1885, 3555, 7125, 14,100, 21,010, 52,000 and 145,600 kc. The next qualifying run from W6OWP only will be transmitted on May 7th at 2100 PDST on 3590 and 7138 kc.

Any person may apply; neither ARRL membership nor an amateur license is required. Send copies of *all* qualifying runs to ARRL for grading, stating the call of the station you copied. If you qualify at one of the six speeds transmitted, 10 through 35 w.p.m., you will receive a certificate. If your initial qualification is for a speed below 35 w.p.m., you may try later for endorsement stickers.

Code-practice transmissions will be made from WIAW each evening at 2130 EDST. Speeds are 15, 20, 25, 30 and 35 w.p.m. on Monday, Wednesday and Friday, and 5, 7½, 10 and 13 w.p.m. on Sunday, Tuesday, Thursday and Saturday. Approximately 10 minutes' practice is given at each speed. References to texts used on several of the transmissions are given below. These make it possible to check your copy. For practice purposes the order of words in each line of QST text sometimes is reversed.

*Date* Subject of Practice Text from March QST

May 3rd: A Compact Dual Beam . . . p. 11  
 May 6th: Frequency Marker with 60-Kc. Intervals, p. 14  
 May 9th: Overtone Crystals . . . p. 16  
 May 11th: Flexibility in the Antenna Coupler, p. 18  
 May 16th: Low-Noise Receiver Design, p. 20  
 May 19th: The Multimatch Antenna System, p. 22  
 May 24th: The "Hidden Gem," p. 24  
 May 26th: Transmitter Hunting — Seattle Style, p. 25

## BRIEF

An amateur recently wrote the ARRL Communications Department as follows: "Is it possible to obtain a duplicate A-1 Operator Club certificate? Some time ago my wife pitched mine in the alley in a fit of pique. Now my *new* wife might like to see how important the old boy is!" (P. S.: He got the certificate.)

## WIAW SUMMER SCHEDULE

(Effective June 1, 1955)

(All times given are Eastern Daylight Saving Time)

*Operating-Visiting Hours:*

Monday through Friday: 1300-0100 (following day).

Saturday: 1900-0230 (Sunday). Sunday: 1500-2230.

A mimeographed local map showing how to get from main highways (or from H.Q. office) to WIAW will be sent to amateurs advising their intention to visit the station.

*Official ARRL Bulletin Schedule:* Bulletins containing latest information on matters of general amateur interest are transmitted on regular schedules. *Frequencies:*

C.w.: 1885, 3555, 7125, 14,100, 21,010, 52,000, 145,600 kc.

'Phone: 1885, 3945, 7255, 14,280, 21,350 kc.; 52, 145.6 Mc.

*Times:*

Sunday through Friday, 2000 by c.w., 2100 by 'phone.

Monday through Saturday, 2330 by 'phone, 2400 by c.w.

*General Operation:* Use the chart below for determining times and frequencies for WIAW general contact with any amateur. Note that since the schedule is organized in EDST, the operation between 0000 and 0100 each day will fall in the evening of the previous day in western time zones.

*Code-Proficiency Program:* Practice transmissions at 15, 20, 25, 30 and 35 w.p.m. on Monday, Wednesday and Friday, and at 5, 7½, 10 and 13 w.p.m. on Sunday, Tuesday, Thursday and Saturday are made on the above-listed frequencies. Code practice starts at 2130 each day. Approximately 10 minutes' practice is given at each speed. On June 17th instead of the regular code practice, WIAW will transmit a certificate qualifying run.

## WIAW OPERATING NOTE

Until June 1st, when the complete WIAW Summer Schedule detailed elsewhere on these pages goes into effect, WIAW will conduct general operation as shown on the chart on page 70, Sept. 1954 QST, *except that EDST instead of EST will be used.* Other operation will follow the pattern set down on page 71, March 1955 QST, also in EDST instead of EST. *Exceptions:* (1) On May 12th, WIAW will transmit a Code-Proficiency Qualifying Run instead of the regular code practice. (2) On May 20th, WIAW will make a special transmission for frequency measurement instead of the regular code practice. (3) WIAW will be closed from 2230 EDST May 29th, until 1500 EDST May 31st, in observance of Memorial Day.

## WIAW GENERAL-CONTACT SCHEDULE

(In Effect June 1, 1955)

WIAW welcomes calls from *any* amateur station. Starting June 1st, WIAW will listen for calls in accordance with the following time-frequency chart.

Time (EDST)	Sunday	Monday	Tuesday	Wednesday	Thursday	Friday	Saturday
0000-0100 <sup>1</sup>	.....	.....	3555 <sup>3</sup>	.....	3945	7125 <sup>3</sup>	.....
1300-1400 <sup>2</sup>	.....	21/28 Mc.	21/28 Mc.	21/28 Mc.	21/28 Mc.	21/28 Mc.	.....
1500-1600	.....	7125	14,100	7255	14,100	7125	.....
1600-1700	.....	14,280	7125	14,100	14,280	14,100	.....
1800-1900	.....	14,280	14,280	14,280	14,100	7255	.....
1900-1930	.....	7255	.....	21,010	.....	14,280	.....
1930-2000	.....	14,100	.....	3555	.....	14,280	.....
2000-2030 <sup>1</sup>	14,280	3555 <sup>3</sup>	14,100	14,100	7125 <sup>3</sup>	14,100	.....
2030-2100	14,280	3555	14,100	14,100	7125	.....	.....
2100-2130 <sup>1</sup>	145.6 Mc.	21,350	145.6 Mc.	52 Mc.	21,350	.....	.....
2230-2300	.....	.....	1885	.....	1885	.....	.....
2300-2330	.....	.....	3555	.....	3945	.....	.....
2330-2400 <sup>1</sup>	.....	3945	7255	3945	7255	3945	.....

<sup>1</sup> Starting time is approximate. General-contact period on stated frequency begins immediately following transmission of Official Bulletin, on c.w. at 0000 and 2000, on 'phone at 2100 and 2330.

<sup>2</sup> Operation will be on 21,010, 21,350, 28,000 or 29,000 kc., depending on band and other conditions.

<sup>3</sup> WIAW will listen for Novice Class licensees on the Novice portion of this band before looking for other contacts.

Having just finished compiling some figures based on 169 EC annual reports received (10 per cent of all ECs), we thought you might be interested in some of the statistics and estimates derived therefrom. We'll present these in expository fashion, so you won't have to try to interpret from tables.

First of all, let us note the percentage of EC annual reports received — 10 per cent. Not too good, is it? Yes, we know that being an EC has a lot of work connected with it, and to a person not too fond of paper work (and who is?) it seems as though Headquarters or the SEC or someone is constantly badgering ECs for reports. Actually, all we ask is a Form 5 (post-card size) once a month to the SEC and a one-page group of figures once a year. From these, we can glean some well-educated national estimates, since 100 per cent response is unthinkable.

You see, we use these data; we're not just trying to make you work for nothing. Once each month we summarize SEC reports (which are based on your monthly Form 5 reports to the SEC), and once each year we summarize EC annual reports and make estimates of national totals based on this. Naturally, the larger the percentage of reports received, the more accurate our estimates will be. However, based on the 10 per cent received this year, here's about what the AREC looks like nationally.

We have about 40,000 AREC members, of which 75 per cent are full members. Almost 13,000 of these are "signed up in RACES," by which they probably mean they are enrolled in local, regional or state civil defense communications with RACES in mind, whether or not they are RACES-authorized. There are about 780 existing RACES plans within the AREC structure, not all approved by FCDA and FCC as yet. Most AREC members continue to operate on the 28-Mc. band (over 20,000), but 3.5-Mc. e.w., 3.8-Mc. 'phone and 7 Mc. also have strong followings — and of course most of them operate regularly on more than one band. Six and two meters have shown great increase in popularity, however.

The AREC has an estimated 17,000 mobile units in operation. Ten meters is still the most popular band for mobile emergency communication, followed by 80 75 meters, 2 meters and "other" bands, in that order. However, since the 1953 year end, the greatest percentage increase in mobile emergency operation has been on two meters. The increase on ten meters has been slight.

Nearly all estimates are up from last year, an indication that amateur interest in emergency work is still on the increase, probably a result of the impact of civil defense. Our estimates show a decline in the number of fixed stations having emergency power available, and declines in the number of AREC members using 80 e.w., 75 'phone and two meters (although mobile operation on 2 shows a large increase).

Interesting? We thought so, and encouraging, too. How accurate are these estimates? Just exactly as accurate as a 10 per cent response in reporting will allow.

Fellows, how about putting dates on the emergencies, drills and tests you tell us about? We had reports on four different emergencies lined up this month that had to be

◆  
This is the Queens County RACES Control Center in New York, in action during the RACES-AREC drill held on February 14. On the left, standing, is Bob Link, W2VKF, RACES Radio Supervisor for the city, and ARRL Emergency Coördinator, explaining the setup to Ben Hamilton, W6VFT, visiting RO and EC from San Diego, Calif.  
◆

shelved because there was no hint as to when the emergency occurred. The date of a blizzard, tornado, fire or other memorable local occurrence might be well known to you, but chances are we never heard about it — so date your emergencies, will ya, huh?

— . . . —  
W5ZU calls our attention to an emergency operation which occurred last year that never got written up, except in his SCM column. We think it should be recorded in this column. It seems that last October 6th, 7th, 8th they had quite a flood in the Roswell-Dexter-Hagerman-Artesia-Carlsbad region of New Mexico when seven inches of rainfall within 48 hours sent the Hondo and Pecos Rivers on a rampage. Roswell amateurs W5s BZA BZB QKG TBP WPA YFN YUM YWU ZM ZU gathered on 3838 kc. while mobiles W5s BZA BZB WPA YUM visited the flood area and relayed reports. Once the situation was "eased," a few stations stayed on hand all night while the rest got some sleep. During the night, W5WPA participated in the rescue of a truck and workers at the Hondo Dam, west of Roswell. At 0630 on the 7th, W5ZU fired up as control station with W5s ARD CXC EFT PSP UTS QKA RNG YAS ZGG AIQ FAB PGJ RZS TDB UP in the net, in addition to those on the previous night. Emergency work conducted included: (1) Assistance to Southern Union Gas Company in coordinating work on an eight-inch gas main crossing the Felix River north of Hagerman (mobiles W5s CXC BZA BZB WPA, and fixed stations W5s AK YAS PSP). (2) An emergency call for boats to be furnished by the National Guard was coordinated by W5s BZA CXC and AK, and later rescue of a man on an overturned boat was coordinated by W5s AK ARD CXC. (3) Communications for radio station KSVP, which had to leave the air; CAA was notified that tower lights were off (W5PSP and W5ZU). (4) Reports on flood conditions were relayed up and down the valley. (5) W5UP stood by at National Guard Headquarters in Roswell to link units in Dexter and Hagerman areas. (6) W5BZA BZB mobile encountered extremely high water between Dexter and Roswell; as a result, the road was closed to traffic. (7) Railroad tracks were washed out near Dexter, W5BZB reporting same to the Santa Fe Railroad office. (8) Because of the loss of life and number of missing persons, many welfare messages were handled in the 3838-ke. network.  
— W5ZU, SCM New Mexico

— . . . —  
On January 14th, an Air Force C-45 ran out of fuel 20 miles northwest of Austin, Texas. Upon hearing the engines quit as the plane passed overhead, W5YYM contacted W5TFY in Austin and set the Austin Emergency Net in operation on 29.2 Mc. A few 'phone calls indicated the authorities knew the plane was down, but had no idea where. W5YYM soon located the airplane on a ranch about

a mile from the nearest road. Doctors and ambulances were ordered and the CAA, Texas Department of Public Safety and Sheriff's department were notified. Mobiles W5s KNM PRO QZJ left immediately for Lake Travis to aid in the search for a crew member who bailed out and was missing. For the first 30 minutes YYM/m was the sole means of communications between the scene of the crash and the state police and other authorities. Much traffic was handled concerning directions to the scene of the crash, medical aid, etc. The missing crewman was found by a ranch hand so all mobile units except YYM returned to Austin by 2030. The net closed down at 2115. Mobile units participating were W5s FXN EHD QZJ PRO. W5TFY was NCS. — W5TFY.

Amateurs in Paterson, N. J., assisted police in solving some mysterious crimes during 1954. EC W2ESW was contacted by the civil defense director, at the request of police, and 21 amateurs set up a net on two meters, with a

Three amateurs who assisted the Illinois Central Railroad during the ice storm last December received citations from the railroad on March 2nd. Shown holding their medals are, left to right, W9PQS, W9KXN and W9PEK. W9KRH was also cited.

control station at police headquarters in charge of KN2CYZ. Each car was assigned a "beat" in the neighborhood where the assailant was known to be operating. The patrol started at 0100 and continued until 0530. This continued for four months, but no further attacks were made. However, on October 14th at 0347 one of the cars (W2ZOE with KN2JCR) reported a suspicious character on one of the streets in the area, and he was picked up by police. His retention resulted in eventual arrest and the solving of a number of previously-unsolved robberies. This continuing patrol in cooperation with Paterson police was conducted by the following amateurs: W2s ESW GQD ZOE NEZ GLO MIU NPT ESC KXR FLQ WBY EHM, K2s CMB GYH CVR EIZ, KN2s JCR IPF IEY IDH CYZ. Thanks to Mr. Arthur Donnelly, a Paterson *Morning Call* police reporter, for this report.

Members of the American Legion Amateur Radio Net and the Lancaster, Calif., AREC and Civil Defense collaborated in assisting search operations for a crashed jet plane on January 13th. Search was conducted from 1900 to 0500 the next day using the 10 meter e.d. frequency, but distances proved too great and the search was reorganized using 75 meters. Here the situation was just the opposite, with long skip making multiple relays necessary. W6EJU's portable emergency trailer was set up as control station, with one relay via W6OLG, W6EJU, K6ARY and K6FCZ operated the control station. Amateurs were responsible for finding the pilot's body and unopened parachute, first reports of this coming from W6PIQ. W6WJF says that training in traffic handling showed up clearly in all operations. Other amateurs reported to have participated in this emergency include K6s IHW DBH GZZ AJN BNS and W6GRO.

Reportwise, we started the new year with a bang, as 17 SECs submitted monthly reports, representing 3878

AREC members. This beats January of 1954 and 1953 both in reports and coverage, and also ties January of 1953 in reports, so we're off to a flying start. Let's keep those reports coming in! Initial reporting sections: Minn., Wash., Maritime, Tenn., W. N. Y., W. Fla., N. Y. C.-L. I., Ga., Ky., E. Fla., Ala., East Bay, San Joaquin Valley, La., Wis., Colo., Ont. Thanks, fellows, for your support. Now how about you other 56 SECs?

## RACES News

A good many RACES organizers have written us for "the latest dope on RACES," or information on how to organize RACES. These are pretty general requests, and they usually get pretty general answers. Just in case you are contemplating asking us the same sort of questions, here are some answers:

1) There is a brief buildown on how to organize RACES in our booklet "Emergency Communications," distributed free of charge to all AREC members. If you'd like a copy, just ask for it.

2) The complete RACES regulations are included in any recent edition of *The Radio Amateur's License Manual*, available from ARRL for fifty cents. Or, if you're interested only in the RACES regulations, your best bet is to write to the Superintendent of Documents, Government Printing Office, Washington, and ask for Part 12, FCC Regulations, Rules Governing the Amateur Service. It'll cost you twenty cents a copy.

3) Three articles on the subject of RACES were written in 1953, and most of the information therein still applies. In any event, it's good background. Read "The Radio Amateur Civil Emergency Service" in three parts, in March, April and May 1953 *QST*. Other articles on RACES have appeared in 1953 *QSTs* for Jan., Feb., July, Sept., and 1954 *QSTs* for Feb., Apr., July, Aug., Sept., Nov., and Dec.

4) If you have any specific questions or problems, write and tell us about them. We'll try to help you.

FCCA now will approve for matching funds civil defense equipment installed in private cars *provided* title remains with the state or political subdivision. So if you've been held up in getting that mobile rig installed for civil defense because you think you can't get matching funds for installation in private cars, now you can go to it. Reference is FCCA Memorandum COMM-2.

Speaking of matching funds, there still seems to be some confusion regarding the term "FCCA approval" as it applies to RACES equipment. Such approval has to do *only* with matching funds, and admittedly the FCCA specs are high. If your civil defense people want to pay the whole price (and this is invariably considerably less than you would have to pay for gear that does meet FCCA specs), *any* type of amateur equipment is permissible, provided it complies with FCC regulations.

What's new in your RACES outfit? Got any hot ideas you'd like to share with the rest of the amateur world? How about gimmicks for recruiting, training, getting results in drills, building gear, etc.? Come on, you RACES enthusiasts, *give!*

## NATIONAL CALLING AND EMERGENCY FREQUENCIES (kc.)

C. W.	'PHONE
3550 14,050	3875 14,225
7100 21,050	7250 21,400
28,100	29,640

During periods of communications emergency these channels will be monitored for emergency traffic. At other times, these frequencies can be used as general calling frequencies to expedite general traffic movement between amateur stations. Emergency traffic has precedence. After contact has been made the frequency should be vacated *immediately* to accommodate other callers.

The following are the National Calling and Emergency Frequencies for Canada: c.w. — 3535, 7050 14,060; 'phone — 3765, 14,160, 28,250 kc.

## TRAFFIC TOPICS

Someone reminded us that we have never printed a picture of our BPL Traffic Medallion, authorized by the Board of Directors at its 1954 meeting. Most of you traffic men (and gals) who have been working so hard to get this award don't even know what it looks like. So here it is, about twice actual size. Purty, ain't it?

How do you get it? Well, it's easy — all you have to do is to make BPL three times since June 1, 1954. After your third BPL is printed in *QST*, we send you a little card that says you handled all that traffic by yourself, at your own station, on amateur frequencies, in standard ARRL form. You sign this card, send it back to us, and we send you the medallion.

You only get one medallion, so take care of it. We're not going to send you one for each three times you make the BPL. Wear it on your watch chain, or as a necklace ornament, and wear it proudly at club meetings, conventions, or other amateur gatherings. It's a mark of distinction, like a Phi Beta Kappa key.

Miscellaneous net reports: (1) The Early Bird Net traffic count for February was 782. (2) The Transcontinental Relay Net had 28 sessions, traffic total of 1230, participation by seven stations. (3) The North Texas-Oklahoma Section Net had 28 sessions, 923 check-ins, 333 messages handled. (4) The First Call Area of the Transcontinental Phone Net registered 674 message counts with 14 stations participating. (5) The College Net met 8 times, was attended by 56 different stations, handled 13 messages.

**National Traffic System.** We have just completed compilation of some NTS 1954 statistics, which might be of interest. NTS nets reported 9642 sessions in 1954, handled 106,904 messages. We received 285 reports altogether, about half of them reports of section nets, the rest regional and area. About 25 per cent of the reported NTS traffic total for the year was reported by section nets. Kudos to the managers of 1RN, 4RN, 8RN, EAN and CAN for a 100 per cent reporting job during 1954. RN6, 9RN, TEN, TRN and PAN also reported every month, but data on the report were incomplete or not properly executed through misunderstanding. This makes ten of the 14 NTS nets at regional and area level turning in reports every month during 1954. A very wonderful reporting record, gang. We dream of 1955 and a perfect record. Yes, we said "dream."

The Tenth Regional Net handled by far the greatest amount of traffic (21,972) during the year, with 9RN second with less than half as much (7822). Much of this traffic, in both cases, was "through" traffic not ordinarily handled at regional level, although 9RN returned to a strictly regional function with its separation from TLJ in April. Among the remaining regional nets, RN6 was high with 4501, followed closely by RN5 with 3874 and 4RN with 3765. The three area nets were very close, with PAN tops at 9506, followed by EAN with 8109 and CAN at 7715.

All in all, a very good NTS year, showing a continued increase in interest and activity. Of course we can't show an increase forever, but we think still more progress can be made before we reach a peak. Let each NTS net endeavor to do its share to account for an even better showing in the year 1955.

## February reports:

Net	Ses- sions	Traffic	Rate	Aver- age	Repre- sentation
1RN	24	300	0.51	12.5	91%
2RN	48	275	0.65	5.7	100
4RN	21	155	0.31	7.4	38
RN5	44	640	0.93	14.5	61
RN7	45	148		3.3	37
8RN	37	259		7	85
TRN	35	131	0.59	3.8	82
EAN	21	728	0.95	30.3	97
CAN	20	788	1.01	39.4	98
PAN	21	853	1.01	35.6	100
Sections*	549	3713			
TCC Central		360			
Summary	871	8350	PAN	9.6	2RN
Record	871	10,670		19.1	PAN

## Late reports:

TEN (Jan.)	68	1886	27.7	63%
------------	----	------	------	-----

\* Section nets reported: NLI (N.Y.C.-L.I.); QKN, QKS & QKS-SS (Kans.); NEB (Nebr.); CN & MCN (Conn.); TLCN (Iowa); AENB & AENP (Ala.); MON (Mo.); WVN (W.Va.); Tenn. Regular & Tenn. Early; NTX (No. Tex.); KYN (Ky.); Minn. Sect. & Minn. Phone; WSN (Wash.); QMN (Mich.).

At the time this copy was being written, reports were missing from 3RN, RN6, 9RN, TEN and two TCC directors — just after we got through bragging above about the reporting record for 1954. No doubt some of them will be coming through late, and whether or not we can get them into the copy remains to be seen. NCSS can help their net managers to report on time by reporting their session figures to him promptly. Depend on your report not making *QST* unless received here by the fifteenth of the month, even though we can sometimes squeeze it in late; because sometimes we can't.

W1BVR is proud of the fine work being done by his 1RN gang. All section nets reported 100 per cent in 2RN. Negotiations are about completed for a new 3RN manager. Representation on 1RN is needed from C. Z. and West Indies; any help from down there? RN5 net certificates have been issued to W5GVS and W4UHA. RN7 still needs

A few of the Minn. Section Net gang got together in W0KJZ's shack for the above snap-shot. That's Lydia, W0KJZ, in front, while gathered about her from left to right are W0DQL (TEN Manager), W0CGK, W0OMC and W0TKX. Lydia is manager of the Minn. Junior Net.

representation from Saskatchewan and Alaska, both zero for February; several other sections have been spotty, mostly represented by only one or two stations. W8DSX has designated W8JWX assistant 8RN manager for West Virginia. We should be able to announce new managers for 3RN, RN6 and PAN in the near future.

TCC news: W6QPY got himself married and has dropped out of TCC temporarily. W6PKL 0 and VE7QC have combined to take over his many functions. W0BDR, W0SCA and W9UJL are performing all the functions in Central Area TCC. Some "night owls" are needed for a late-hour (0930 EST) function in Eastern Area TCC, on Monday, Wednesday, and Saturday; contact W8UPB.

## SECOND ANNIVERSARY RADIOTELETYPE SS

The RTTY Society of Southern California announces final results of the RTTY SS, held the week end of February 20th. Ninety-four stations in thirty-two ARRL sections were reported active, with W2BDI (S.N.J.), W8ZM (Mich.) and W3PYW (Md.-Del.-D. C.) turning in the top scores. The following tabulation lists call, score and number of sections worked:

W2BDI.....	2800-24	W5HZF.....	520-13
W8ZM.....	2600-20	W9ZBK.....	515-12
W3PYW.....	2520-24	W6OWP.....	456-
W8BL.....	2318-19	W7CO.....	405-15
W6CG.....	2080-20	W8IJV.....	396-11
W6AEE.....	2000-20	W1RBF.....	370-10

## SUPPLEMENT TO NET DIRECTORY

The following list of nets will supplement and correct the listings on page 78, Nov. 1954 *QST*; page 74, January *QST*; and page 75, March *QST*. This list brings the record up to date as of March 18, 1955, and may be used to correct the cross-indexed master multilithed net directory.

An asterisk (\*) indicates correction from previous listing in November, January or March *QST*. This is the final *QST* net supplement prior to fall reregistration of all nets.

--------------	-----	------------	-----

BPL medallions (see Aug. 1954 *QST*, p. 64) have been awarded to the following amateurs since last month's listing: W8ARO, W0NIY.

The BPL is open to all amateurs in the United States, Canada, Cuba, and U. S. possessions who report to their SCMA a message total of 500 or more, or 100 or more originations-plus-deliveries for any calendar month. All messages must be handled on amateur frequencies, within 48 hours of receipt, in standard ARRL form.

• All operating amateurs are invited to report to the SCM on the first of each month, covering station activities for the preceding month. Radio Club news is also desired by SCMs for inclusion in these columns. The addresses of all SCMs will be found on page 6.

## ATLANTIC DIVISION

**EASTERN PENNSYLVANIA**—SCM, W. H. Wiand, W3BIP—SEC: IGW, RM: AXA, PAM: PYF, E. Pa. Nets: 3610, 3850 kc. The West Philadelphia RA held its annual Dinner Party Feb. 22nd. The club wishes to thank DVB, OWK, and WN3ZIA for a very fine banquet. The York Road RC, now 105 members strong, meets on the 1st and 3rd Tue. of each month in Elkins Park at 8:15 p.m. Visitors are invited. The club station, RDM, is net control for its 2-meter net in session every Sun. evening at 9:30 p.m. on 146.25 Mc. All hams in the Philadelphia Area are invited to check in. YAL reports the club is all set for Field Day. JNQ, NNV, and VOI are newly-appointed OOs, while ZSH is now OES. TYW has a new ground plane working on 15 meters and ZFL is building a beam for the same band. AZZ, ex-KGIII, now on his way back to Germany, is looking forward to a D1.1 call. KAG is back on the air moving to a new QTH. VVV/WUE, an XYL/OM combination, currently active on the PFN, is sporting a new Viking KW. We're pleased to report QGI is back on the air after six weeks in the hospital. OZY is looking for more traffic. UOE is up to 43 countries on 80 meters using his 807's but still needs Asia to make WAC on that band. DUI raises a good question. Are we going to have another picnic this year? Let's plan for it now and announce the date and place in this column. NNV reports his two sons, WNs 3AQI and AQM, are soon to be transferred to Kelly AFB. EAN keeps in touch with his Dad in Miami Beach on 20 and 40 meters. ZBD is a newcomer to the traffic business and the only c.w. outlet for Reading in many a year. The EPA Net welcomes your presence. OM, ABT reports better luck in hearing DX since tuning the receiving antenna. The most recent Novice station to report is WN3BFM. Welcome. OM. Traffic: (Feb.) W3CUL 1456, OK 124, TEJ 91, WUF 66, DUI 65, VVV 58, GFS 56, OZY 55, MWL 50, UOE 38, BFF 31, PYF 27, ELI 20, QIZ 17, PUY 7, PYP 7, ZBD 6, JNQ 5, ADE 2. (Jan.) W3MWL 39, ABT 2.

**MARYLAND-DELAWARE-DISTRICT OF COLUMBIA**—SCM, Arthur W. Plummer, W3EQK—On a recent Sat. at 6:30 p.m. approximately 150 members of the Amalgamated Association of Ozone Sniffers gathered at the famous Olney Inn between Washington and Baltimore where they were nobly entertained with masterful demonstrations of metaphysics and mendacity by DWD. A very interesting informal talk was given by George Sterling, 3DF/1AE, who also presented Haraden Pratt, ex-SKH, with the only certificate of its kind for being the oldest ham in or out of captivity. It seems that he started his hobby of spark-gapping the ozone way back in Sept. 1905. Information from several W4s present is to the effect that the Roanoke Division Convention will be held Aug. 12-13-14 at the Chamberlain Hotel at Old Point Comfort, Va. For information contact 4HV or 4NV. RVL reports the Radiation Lab. Radio Club, ZIB, had two transmitters in operation at Parkton, Md., during the V.H.F. Sweepstakes. The Club also sponsored a transmitter hunt Jan. 20th which was won by QLP, with VLL right on his heels. Eighteen stations out of 59 checking into the MEPN for January received the rating as toppers. NNX is now Deputy Chief of RACES in Baltimore under SKK, who is Chief RACES Officer. HTB is the new District Radio Officer Northeast District, replacing NNX. NKX is the new Southern District RACES Coordinator and QER takes his place as new Southern District RACES Officer. Other new appointments are YYB Northern District Deputy Radio Officer, KWX as Northwestern District Deputy RO, and UOJ for the Southwestern. CVS and YJB are active in the net at Northern. ZAR has received an appointment to the Air Academy. EMZ has been appointed RO for Northwestern Dist. ZNH has his General Class ticket. MAZ's XYL, Nina, is studying for her ham ticket. RKK has left Northern and is now attached to Main Control. John Bagliani, owner of Radio Electric Supply Co. in Baltimore,

and well known to everyone in electronics, was operated on during the latter part of February in Mercy Hospital but is coming along very nicely. EQK has a new Hammarlund HQ-140X. GBB is moving from Baltimore City to Anne Arundel County. The Delaware Amateur Radio Club of Wilmington now meets the 2nd Wed. of each month in the meeting room of the Grace Methodist Church. At the February meeting the DARC heard a talk on transistors by a Bell Telephone Company representative. TGF is rearranging his station and expects to be much more active. EQK received a TPA certificate from the Radio Club of Argentina for having worked the 21 Pan-American Countries and Canada. He needs only a QSO with a British Colony station in Asia to get the WBE certificate. MZK has completed a cubical quad for 20-meter c.w. Ron also is sporting his OTC certificate. CDQ is teaching code like mad these days and is very active on 40 meters. HKS hopes to be on soon with a new rig. QCB reports he recently made a killing on some nice equipment. LMC recently was guest speaker at the Aero Amateur Radio Club. KLYA was named chairman of the Club TVI committee. WN3YZJ has completed ten-element "Brownie" beam for 2 meters and is on nightly with a Gonset Communicator. YQJ skeds UJG regularly on 220 Mc. along with 4UMF and signals are from S4 to S9 with seldom a miss. YQJ is using an 822A into 16 horizontal elements. Traffic: (Feb.) W3WV 539, K3WEJ 376, W3UE 274, PKC 171, RV 155, ONB 121, PQ 107, IIC 26, EQK 9. (Jan.) W3COK 90, MCG 76, ONB 63.

**SOUTHERN NEW JERSEY**—SCM, Herbert C. Brooks, K2BG—PAM: ZI. New appointments: K2EDL as OO and YRW as OBS. EGP and EWN has reactivated the South Jersey 2-meter Net at 1900 Tues. on 145.4 Mc. UKS, Ocean City, expects to be "chief" aboard the SS *North America* on the Lakes this summer. Look for Bill on all bands 20 meters and below. We are indebted to K2CEE, Pleasantville, for the Southern Counties Amateur Radio Society news. The SCARA meets the 2nd Mon. of each month at the Pleasantville City Hall. CGP is active on 20 meters with a new three-element beam. Art has worked 109 countries. AQP is on 2 and 75 meters. K2KAA, K2JIO, and K2EQC are giving 160 meters a round. HIB has just returned from a 6-month trip in and around the Mediterranean. The SCARA runs two nets, Sun. at 10:30 a.m. on 3975 kc. and Mon. at 8 p.m. on 1815 kc. The Club is planning more activities in c.d. The DYRA WAS Contest is going strong with many participants. LSS and K2BDD, both on 40-meter c.w., are working good DX. HIA is heard regularly on 40 meters. ZNO has moved to a new QTH so operation is temporarily suspended. K2INQ has dropped the "N." FB. Peggy, The Burlington County Radio Club is holding weekly drills Fri. nights on 2 and 10 meters. KN2JWZ, Lawrenceville, is interested in starting a Novice net. Drop him a line for particulars. ADA is on the mend after a recent operation. LYL has a new rig on 10 meters. Again we urge that emergency gear be kept in good repair and be given periodic checks. Traffic: W2RG 127, ZI 30 ASG 16, K2BG 10, W2SUG 10, YRW 8.

**WESTERN NEW YORK**—SCM, Edward G. Graf, W2SJY—Asst. SCM: Jeanne Walker, 2BTB. SEC: UTH/FRL. RM: RUF. PAMS: GSS and NAI. NYS meets on 3615 kc. at 6:30 p.m. and 3925 kc. at 7 p.m.; NYSS on 3595 kc. at 8 p.m.; NYS C.D. on 3509.5 and 3993 kc. at 9 a.m. Sun.; TCPN 2nd Call Area on 3970 kc. at 7 p.m.; SRPN on 3970 kc. at 10 a.m.; ISN on 3980 kc. at 3 p.m. New officers of Lockport ARC are K2EGD, pres.; TPE, vice-pres.; A. Retzlaff, secy. JFN, treas. The meeting topic was Show and Tell. Those bringing gadgets and telling about them were FEB, ZOC, RXM, YLT, JFN, RUI, ALR, CWB, and K2s GKM, ALB, and ELS. DVD's XYL is K2GHF, Niagara RC officers are LCP, pres.; CMV, vice-pres.; VESIM, secy.; RVJ, treas. Net certificates have been issued to COB, ZZG, BKC, MZ, PKG, and K2s APV and CIG. A new club has been formed in Watertown with ZYD, pres.; K2DUO, vice-pres.; K2GWN, secy.; and KN2JDE, treas., which meets the 2nd/4th Thurs. at 7 p.m. in Jefferson County c.d. rooms in Thompson Park. FE and QQ are active OOs. BLO, EZP, and PZF are on 2 meters. K2HXC received General Class license. K2GVF dropped the "N." VMV is on with an 813. FJN runs 150 watts into a Zepp on 75 meters. K2HLY now is General Class on all bands running 35 watts. KN2HJC and his 10-year-old son, KN2HJD, are boning up for the General Class exam. QWA, on 75 meters, purchased a surplus Collins 30-J and is modifying it for ham use. TQ finds 15-meter DX good. UNC has 813 final running 300 watts. ETW is on with a B&W. DUZ is on 20-meter 'phone. GSX uses an Elmac for fixed and mobile. OZY has been appointed RO for Clinton County. Corning QRM states

the first group of walkie-talkies has been completed. The Club conducts code classes. KEL is catching up on DX on 20 meters after OBS work. CXM is running propagation tests with SZ, IYC, AEE, and others on 160, 80, 75, and 2 meters. FDI had help putting up a 20-meter beam. K2GVN is coordinator of the Tri-State Net on 3687 kc. at 0700 daily, with IZHO and K2EPQ assisting. OPD has resigned as manager of NYSS and K2DYB has taken over. EMW is running 200 watts to an 813. All amateurs interested in forming a club in Clinton County, please contact K2HJC. KN2LBL is a new Novice in Morrisonville. QBB received his WAS certificate and is on 20-meter c.w. since swapping his BC-312 for an HQ-129X. The KBT held an auction. New officers of Elmira Area are K2DPX, pres.; SHE, vice-pres.; WZF, secy.; KN2HNB, treas. K2BUI is putting c.d. modifications to a Viking II. K2DOZ and PPR have new HQ-140 receivers. K2GOK, of Olean, now in the Air Force with the call KR6PR, would like to hook up with Statelike pals on 20 meters, phone or c.w. K2DYC reports that K2DXE worked France in the Novice band. K2s DOI and DAO are on 220 Mc. KN2s KIR, KTE, KTF, and LAD are graduates of Auburn Area code classes. K2GVS is chairman of AARA Field Day. K2GVJ has a B&W. RARA has passed the 200 mark in membership. OWF has an 829B on 6 meters. The RARA v.h.f. group met at the home of ZS. The RARA is compiling a club directory for members. PCN and UTH reported some new countries in the DX Contest. UTH and SJV were guests of KBT president UHI. IHDQ and UHI have a sked on 144 Mc. Sat. at 8 A.M. and would like some activity after the sked. AIC is back from Korea and in college in Wisconsin. Traffic: (Feb.) W2RUT 538, OE 126, YGW 102, HKA 96, ZRC 89, K2DJN 89, DSR 58, W2DSS 43, CXM 38, K2DQ 33, CCQ 11, W2FEB 10, RQF 10, K2AIH 4, (Jan.) W2CXM 62, K2AMZ 16, W2WS 8.

**WESTERN PENNSYLVANIA**—SCM, R. M. Heck, W3NCD—SEC: GEG, RMs: NUG, CHN, GEG, and NRE, PAMs: AER and LNE. The W. Pa. Traffic Net, which meets on 3585 kc. at 7 P.M. Mon. through Fri., reports 248 attendance and 144 messages handled during February. TMA has taken a job with CBS-Hytron and will be moving to Danvers, Mass., so has resigned as president of the Bucktail Amateur Radio Club of Emporium. RVS is running a c.d. net for Cameron County on 29,460 kc., 146,820 kc. and 6 meters if necessary. IYC is working the YLRL nets. HXN, RMX, RJM, and NGZ are building equipment. RLH occasionally joins the 29,080-ke. Com-muters Net. LEH and ZHM are working 220 Mc. WH is n.f.m. on 40 meters. VEE is busy with school activities. VEF is working the club station. PTU is on 80, 75, 40, and 10 meters. OLB has moved to Elmira. N. Y. OG5 is back working part time. ZKY passed the General Class exam. NMJ is working 19X and traffic. The South Hills Brass Pounders and Modulators Monitor editorial staff, LDB, VKS, QOQ, ZSP, and TFC, get out the SHBPM news. ZDK received his new ticket on his birthday. OKU is trying s.s.b. NYG is operating from a new QTH. KPO is mobile on 10 meters. New calls are W3AWC and W3AYB. The Radio Assn. of Erie reports gains in the membership. STK is giving weekly code classes. TNM has joined the Lake Erie Emergency Net. MS is working DX. NXX is putting on a shortwave demonstration at Vernondale High School. New calls are W3 BHJ, BBO, BFB, AQC, and ZQS. From Steel City ARC, NKM is giving s.s.b. a try-out along with MTP. JSS is reported transferred to Boston. W3ANX is on 40 meters. TZW donated the Club a 300-watt c.w. rig. CUM, who has drawn the job of reporting the news from the Butler County Amateur Radio Assn., describes the build-up of an active Butler County C.D. Net with 12 operators checking in each Thurs. at 7 P.M. on 29.6 Mc. LXQ is reported doing a fine job working as liaison between W. Pa. C.W. Net and the Pa. Phone Net (PFN 3550 kc. 1830 EST Mon. through Fri., PYF manager). LMM is proud of his new A-1 Operators Club certificate. Traffic: W3WUQ 1766, LMM 158, QUG 126, LXQ 120, NRE 90, KUN 60, CHN 57, NUG 47, SJJ 34, OEZ 25, KNQ 15, UTX 11, NCD 7, PWN 3, NMJ 1.

## CENTRAL DIVISION

**ILLINOIS**—SCM, George T. Schreiber, W9YIX—Section Nets: ILN (3515 kc.) IEN (3940 kc.) RMs: BUK and MRQ. PAM: UQT. SEC: HOA. Asst. SEC: VTL. Cook County EC: HPG. It has been announced that the annual Starved Rock Radio Club's now justly famous hamfest will be held June 5th, same place. OO renews the month: KA, ICF, JMG, and PHE. ORS: WES, BPC, UCM, OIN, MRQ, JMG, and KJ. OPS: ACU, PHE, and ICF. Making BPL this month are AA, who now becomes eligible for the traffic medallion, DO, and K9FCA. A new Novice is OIH, 11 years old, who has adopted the slogan "Old Intelligent Ham." BUK revived the Illinois C.W. Net paper, *Illinois NUZ*, and got out an interesting issue. CZB lost four power transformers in a damp basement but stays on the air through RGU, the c.d. station at Rockford. HUX says he has moved so many times he can reassemble his transmitter blindfolded. He likes his new VFO. The Society of Radio Operators provided a demonstration of amateur radio for the Lions Club, with ZNY on the air from the meeting place. UVM/0 now is chief

operator of KARL, the student-owned broadcast station at Carleton College. CSW had plenty of rig trouble, but has the 30K running again and is sparking the North-Central Phone Net as NC's four mornings a week. PNK and K9FCA spell him two days. The Net meets at 0700 CST with 15 states checking in. DO made the public prints, as did MRW, with laudatory newspaper stories. New kw. rigs are sported by KJ and BUK. JMG built a modulator for his 30-watt job. When someone calls for Ruth, at GVO, he might be asking for the OM, whose last name is Ruth, or the XYI, whose first name is spelled that way. ING has returned from Mexico, where he operated NE1XE. INF travels so much he is tickled when he can get back to Chicago to attend the Hamfesters Club. AA is playing with a new trick keying relay and prevents BC1 and TV1, maybe he'll write about it. Organizers of the Kankakee RACES 2-meter Net are KLD, HKA, NKR, and QDK. Again TAL warned of interference to Loran by 160-meter stations off-frequency and PBI checked 15 Novice harmonics near 7500 kc. Watch out, fellows! Congrats to WVR and his XYI on their new daughter. NBB has moved to Champaign, and PK to Michigan. SKR spends his spare time dreaming up antenna couplers and building low-pass filters. Freepot amateurs have organized a club, as yet unnamed, but with the following officers: ECS, HAF, CHU, GUY, and RQY. PPM and ZMJ are on the air with new portable 6-meter rigs. They also run a code class and graduated Novices OEZ, OOG, MPN, OFP, and OOC. ZSN's new QTH is Washington, Ill. HPJ and EVA bought Russian code teletypewriters and are busy converting them to send English characters. AVJ gets good results with a pair of phased verticals on 80 meters. SEF writes he is almost blind now, but has a good chance of recovering. TQL took two days of vacation for the DX Contest and broke down the first hour. NN visited a ham club and heard himself roasted for stealing the rare ones before he identified himself. JCX received General Class license and manages to get on the air daily. HYK celebrated his 80th birthday and still keeps a regular sked with his son, DPY. Traffic: W9DO 1070, K9FCA 682, W9IDA 411, AA 281, SAE 153, QOG 106, YIX 54, MFX 53, BUK 52, MRQ 45, VHD 40, BRD 26, STZ 25, LNJ 20, FKP 15, WVR 7, KLD 5, PHE 5, CNF 4.

**INDIANA**—SCM, George H. Graue, W9BKJ—The LCARC concluded its year of activity by holding its second annual banquet with more than 200 in attendance. The NERC has new club headquarters in the City Hall Building. The FWRC held its annual auction. The mobile group demonstrated at a father-son church banquet on how amateur radio can serve civil defense. The MARC (Madison) is planning its 3rd annual hamfest in May, the exact date to be announced later. The TARS reports 35 members certified to RACES. DGA, UHC, AIN, and FJ1 mobilized to Princeton to visit URQ, TKK, ZRR, and N9JEP. DQJ has a new Gonset Communicator. SWN and ZPP are f.m. on 117.3 Mc. UMS is out for DX with a kw., likewise BBC. ZHJ has a new Viking Ranger. SVL had a nice write-up in the Perfect Circle Corp. news organ. Wheel Static held a transmitter hunt with NAR the winner and MYI a close second. DRJ became a proud grandpappy recently. QZC wants a sked for test on 220 Mc. January total traffic on QIN was 612. February total was 476, as reported by OLN net manager. YIP, net manager for RFN, reports a total of 233. WWT, net manager for RFN, reports 125. EHZ reports 113 for CAEN. Those making BPL in February were JUJ, NZZ, and TT. JCJ is keeping 11 schedules daily. NZZ received the coveted A-1 Operator certificate. TT has a new Signal Generator. WWT has applied for OBS appointment. New NCs on QIN are WRO and SKP. IMO is building 220-Mc. rig for 64-element beam. KPL has a new Collins transmitter and receiver. CRP is convalescing after a long illness. EAU has a three-element beam on 14 Mc. AQB expects to be an OPS soon. SVL has a new HT-9, also new mobile rig. CC is recovering from a hernia operation. PPS is operating at YB. NH has worked 20 countries and has been heard in 5 others on 160-meter c.w. NTR received a 1-kw. rig as a gift. Traffic: W9JLJ 1404, NZZ 746, TT 521, WWT 263, WRO 297, TG 182, STC 160, OZO 156, EHZ 150, TQC 136, UOP 132, BKJ 88, QYC 88, ZYK 69, CTF 63, WUH 48, FGX 46, VNY 40, AQB 35, NTA 34, POA 33, YIP 33, CEA 26, SVL 26, CMT 24, ZRP 23, DOK 22, EHE 22, CC 21, YB 18, QR 17, EQO 12, SKP 11, DZC 8, KDVS 6, GDL 7, BDP 5, ZIB 4, FSA 3, NH 3, PPS 3, YVS 2, DKR 1, GDL 1.

**WISCONSIN**—SCM, Reno W. Goetsch, W9RQM—SEC: OVO. PAMs: ESJ and GMV. RMs: IX, RTP, and UNJ. Nets: BEN, 3950 kc., 6 P.M. daily; WIN, 3685 kc., 6 P.M. daily; WPN, 3950 kc., 1215 Mon.-Sat., 0930 Sun. Wisconsin mobile and c.d. frequency: 29,620 kc. New calls in Waukesha are W9NMA, NOP, and ONH. DIK has a new Matchbox antenna coupler. IUU is planning on the Field Day use of the new 750-watt gas generator. SDR picked up 3 new countries during the first week end of the C.W. DX Test. RKP has 15 countries on 3.5 Mc. Because of the proximity of RTTY and the resultant QRMI, WIN shifted its frequency from 3625 to 3685 kc., effective March 15th. WPN had 30 sessions in January with 801 QNI and 138 messages handled, according to SAA. KNK is the proud owner of a new Johnson Viking II

(Continued on page 82)

**L**ISTENING on almost any amateur band one is likely to get the impression that a new type of r.f. amplifying system has recently been developed. This "new" system eliminates all T.V.I., all spurious and harmonic radiations, has high efficiency, has low efficiency, uses only special tubes, can use any tubes, etc., etc. Thus, it is evident that some degree of confusion exists and it seems appropriate to again review some of the clear-cut facts about linear amplifiers.

**T**HEY are not new at radio frequencies as they have been used for years by commercial services. All amplifiers have some degree of distortion thus developing harmonics and inter-modulation products. A linear by its nature will have less of these unwanted products, but good operating and engineering practice make mandatory a carefully designed, tuned tank circuit or pi-network output to reduce spurious radiations to a minimum level.

**T**HE efficiency of a linear amplifier is lower than a Class C stage when rated on a plate power input basis, but when used for S.S.B. and properly rated and measured can provide about 65% plate efficiency.

**A**LMOST any tubes can be used as linear amplifiers. Some, however, will have higher internal losses than others, but would also exhibit these same characteristics when used in Class C applications.

**A** CONVENIENT measure for evaluating linear amplifiers on a cost basis, for a given plate input, is to compare the combined replacement cost of the r.f. and rectifier tubes. For 500 watts input and Class B operation the most economical combination is a pair of 811-A's and 866-A's for a total cost of slightly more than \$14.00. The associated circuit simplicity for this combination also assures increased reliability and further economies. The dollars thus conserved can be spent for the most efficient r.f. input and output circuits to reduce drive requirements and obtain the maximum suppression of spurious signals.

**A**LL of these features, and more, are in the new HT-31 amplifier soon to be announced.

## a new concept in linears

CENTRAL ELECTRONICS takes pride in presenting a product of intensive research — the new Multiphase 600L Broad-Band\* Linear. "It is destined to change the entire concept of RF amplifier design in the military, commercial and amateur fields." There are no tuning controls, servos or moving parts other than band-switch.

- Single 813 in Class AB<sub>2</sub>.
- New band-pass couplers provide high linear efficiency: 60 to 65%.
- Designed for 50 — 70 ohm co-axial input and output.
- Easy to drive — Approx. 2 watts effective or 4 watts peak drive power required for 500 watts DC input.
- Built-in power supply — bias and screen regulation, 45 mfd. oil filled paper output capacitor. Excellent static and dynamic regulation.
- Extremely low intermodulation distortion.
- Automatic relay protects 813 and RF couplers.
- Excellent stability — complete freedom from parasitics.
- Effectively TVI suppressed — RF compartments thoroughly shielded and Hypassed.
- Choice of grey table model, grey or black wrinkle finish rack model.
- Table model cabinet size — 17 $\frac{1}{8}$ " W, 8 $\frac{3}{4}$ " H, 13" D.

Watch for early announcement of other new equipment.  
**CENTRAL ELECTRONICS**

**MODEL AQ**

**MODEL DQ**

**MODEL B SLICER**

## NEW MULTIPHASE "Q" MULTIPLIER AVAILABLE THREE WAYS

1. It's built-in the new Model B Sideband Slicer.
2. Plug it into your present Model A Slicer.
3. Attractive Desk Model, for installation directly into receiver.

The new Multiphase "Q" MULTIPLIER is a tunable IF electronic filter that provides tremendous receiver selectivity for peaking or rejecting a signal on AM, CW or SSB. It employs a new two tube circuit\* with a special very high "Q" pot core inductor. Continuously variable selectivity from 60 cps to normal IF pass-band. Nulls out interfering heterodynes without affecting speech intelligibility. Peak the desired signal; interfering carriers are attenuated up to 50 db.

\*PATENT PENDING

### MODELS MODEL AQ

"Q" MULTIPLIER for installation in Model A Slicer. Includes new front panel. Power-IF cable plugs into accessory socket.

Wired... \$29.50 Kit... \$22.50

### MODEL DQ

Desk Model "Q" MULTIPLIER for use with any receiver having 450 to 500 KC IF. In attractive case 5 1/4" W, 4" H, 5" D, with connecting power-IF cable. Power requirements, 225 to 300 VDC at 12 ma., 6.3 V at .6 amps, can be secured from receiver. Can provide added selectivity and BFO for mobile SSB or CW reception.

Wired... \$29.50 Kit... \$22.50

### MODEL B

Sideband Slicer, same as Model A Slicer but includes built-in "Q" MULTIPLIER. AP-1 not needed.

Wired... \$99.50  
Kit... \$69.50

### Check These Features NOW IN BOTH MODELS

- **Perfected Voice-Controlled Break-in** on SSB, AM, PM.
- **Upper or Lower Sideband** at the flip of a switch.
- **New Carrier Level Control.** Insert any amount of carrier without disturbing carrier suppression adjustments.
- **New Calibrate Circuit.** Simply talk yourself exactly on frequency as you set your VFO. Calibrate signal level adjustable from zero to full output.
- **New AF Input Jack.** For oscillator or phone patch.
- **CW Break-in Operation.**
- **New Gold Contact Voice Control Relay.** Extra contacts for muting receiver, operating relays, etc.
- **Accessory Power Socket.** Furnishes blocking bias for linear amplifier and voltage for optional VFO (Modified BC458 makes an excellent multiband VFO.)
- **40 DB or More Suppression** of unwanted sideband.

### SIDE BAND SLICER

#### MODEL A IMPROVES ANY RECEIVER

Upper or lower sideband reception of SSB, AM, PM and CW at the flip of a switch. Cuts ORM in half. Exalted carrier method eliminates distortion caused by selective fading. Easily connected into any receiver having 450-500 KC IF. Built-in power supply. Reduces or eliminates interference from 15 KC TV receiver sweep harmonics.

Wired and tested... \$74.50

Complete kit... \$49.50

### AP-1 ADAPTER

Plug-in IF stage—used with Slicer, allows receiver to be switched back to normal.

Wired and tested, with tube... \$8.50

### NEW AP-2 ADAPTER

Combined AP-1 and xtal mixer. Allows Slicer to be used with receivers having 50, 85, 100, 915 KC and other IF systems. One xtal suffices for most receivers.

\$17.50

**MODEL 20A**

- **20 Watts Peak Envelope Output** SSB, AM, PM and CW
- **Completely Bandswitched** 160 thru 10 Meters
- **Magic Eye Carrier Null** and **Peak Modulation Indicator**

Choice of grey tople model, grey or black wrinkle finish rock model.

Wired and tested... \$249.50

Complete kit... \$199.50

### 458 CONVERSION KIT

Basic 458 Conversion Parts Kit, 15 to 160 meters, with dial, etc... \$15.00  
458 Deluxe Case and Panel Kit, matches size and appearance of Slicer... \$10.00

### NEW — FOR 10 METERS

MODEL 458-10 xtal controlled converter package to extend 458 VFO into 10 meter band. For use with above 458 Conversion Kits.

Wired... \$37.50

Kit... \$27.50

**MODEL 10B**

### SUCCESSOR TO THE POPULAR MODEL 10A

- **10 Watts Peak Envelope Output** SSB, AM, PM and CW
- **Multiband Operation** using plug-in coils.

Choice of grey tople model, grey or black wrinkle finish rock model. With coils for one band.

Wired and tested... \$179.50

Complete kit... \$129.50

### QT-1 ANTI-TRIP UNIT

Perfected Voice Operated Break-in with loudspeaker. Prevents loud signals, heterodynes and static from tripping the voice break-in circuit. All electronic — no relays. Plugs into socket inside 20A or 10B Exciter.

Wired and tested, with tube... \$12.50

# Heathkit VFO KIT

MODEL VF-1

**\$1950**

Ship. Wt. 15 lbs.

Here is the new Heathkit VFO you have been waiting for. The perfect companion to the Heathkit Model AT-1 Transmitter. It has sufficient output to drive any multi-stage transmitter of modern design. A terrific combination of outstanding features at a low kit price. Good mechanical features at a low kit price. Coils are wound on heavy duty

and electrical design insures operating stability. Coils are wound on heavy duty ceramic forms, using Litz or double cellulose wire coated with polystyrene cement. Variable capacitor is of differential type construction, especially designed for maximum bandspread and features ceramic insulation and double bearings.

This kit is furnished with a carefully precalibrated dial which provides well over two feet of calibrated dial scale. Smooth acting vernier reduction drive insures easy tuning and zero beating. Power requirements 6.3 volts AC at .45 amperes and 250 volts DC at 15 mills. Just plug it into the power receptacle provided on the rear of the AT-1 Transmitter Kit. The VFO coaxial output cable terminates in plastic plug to fit standard 1/4" crystal holder. Construction is simple and wiring is easy.

- Smooth acting illuminated and precalibrated dial.
- 6AU6 electron coupled Clapp oscillator and OA2 voltage regulator.
- 10 Volt average output on fundamental frequencies.
- 7 Band calibration, 160 through 10 meters, from 3 basic oscillator frequencies.

Open layout, — easy to build — simplified wiring.

Smooth acting illuminated dial drive.

Clean appearance — rugged construction — accessible calibrating adjustments.

Ceramic coil forms — differential condenser.

Copper plated chassis — careful shielding.

## Heathkit AMATEUR TRANSMITTER KIT

MODEL AT-1

**\$2950**

Ship. Wt. 16 lbs.

### SPECIFICATIONS:

Range 80, 40, 20, 15, 11, 10 meters.  
6AG7 ..... Oscillator-multiplier.  
6L6 ..... Amplifier-doubler.  
5U4G ..... Rectifier.  
105-125 Volt A.C. 50-60 cycles 100 watts. Size 8 1/2 inch high x 13 1/8 inch wide x 7 inch deep.

Crystal or VFO excitation.

Rugged, clean construction.

Prewound coils — metered operation.

52 ohm coaxial output.

Single knob band switching.

Built-in power supply.

Here is a major Heathkit addition to the Ham radio field, the AT-1 Transmitter Kit, incorporating many desirable design features at the lowest possible dollar-per-watts price. Panel mounted crystal socket, stand-by switch, key click filter, A. C. line filtering, good shielding, etc. VFO or crystal excitation—up to 35 watts input. Built-in power supply provides 425 volts at 100 MA. Amazingly low kit price includes all circuit components, tubes, cabinet, punched chassis, and detailed construction manual.

## Heathkit COMMUNICATIONS RECEIVER KIT

Four band operation 535 to 35 Mc.

Stable BFO oscillator circuit.

RF gain control with AVC or MVC.

Six tube transformer operation.

Electrical bandspread and scale.

5 1/2 inch PM Speaker-Headphone Jack.

Noise limiter—standby switch.

### SPECIFICATIONS:

Range.....535 Kc to 35 Mc  
12BE6.....Mixer-oscillator  
12BA6.....I. F. Amplifier  
12AV6 Detector—AVC—audio  
12BA6.....B. F. O. oscillator  
12AG6.....Beam power output  
5Y3GT.....Rectifier  
105-125 volts A.C. 50-60 cycles, 45 watts.

A new Heathkit AR-2 communications receiver. The ideal companion piece for the AT-1 Transmitter. Electrical bandspread scale for tuning and logging convenience. High gain miniature tubes and IF transformers for high sensitivity and good signal to noise ratio.

Construct your own Communications Receiver at a very substantial saving. Supplied with all tubes, punched and formed sheet metal parts, speaker, circuit components, and detailed step-by-step construction manual.

MODEL AR-2

**\$2550**

Ship. Wt. 12 lbs.

### CABINET:

Proxylon impregnated fabric covered plywood cabinet. Ship. weight 5 lbs. Number 91-10, \$4.50.

**HEATH COMPANY**  
BENTON HARBOR 9, MICHIGAN

# New HEATHKIT DX-100

# PHONE AND CW TRANSMITTER KIT

MODEL DX-100

Shpg. Wt. 120 lbs.

**\$189.50**

Shipped motor freight unless otherwise specified. \$50.00 deposit with C.O.D. orders.

- R.F. output 100 watts Phone, 125 watts CW.
- Built-in VFO, modulator, power supplies. Kit includes all components, tubes, cabinet and detailed construction manual.
- Crystal or VFO operation (crystals not included with kit).
- Pi network output, matches 50-600 ohms non-reactive load. Reduces harmonic output.
- Treated for TVI suppression by extensive shielding and filtering.
- Single knob bandswitching, 160 meters through 10 meters.
- Pre-punched chassis, well illustrated construction manual, high quality components used throughout—sturdy mechanical assembly.

## Heathkit GRID DIP METER KIT

MODEL GD-1B

**\$19.50** Shpg. Wt. 4 lbs.

The invaluable instrument for all Hams. Numerous applications such as pre-tuning, neutralization, locating parasites, correcting TVI, adjusting antennas, design procedures, etc. Receiver applications include measuring C, L and Q of components—determining RF circuit resonant frequencies.

Covers 80, 40, 20, 11, 10, 6, 2, and 1 1/2 meter Ham bands. Complete frequency coverage from 2—250 Mc. using ready-wound plug-in coils provided with the kit. Accessory coil kit, Part 341-A at \$3.00 extends low frequency range to 350 Kc. Dial correlation curves furnished.

Compact construction, one hand operation, AC transformer operated, variable sensitivity control, thumb wheel drive, and direct reading calibrations. Precalibrated dial with additional blank dials for individual calibration. You'll like the ready convenience and smart appearance of this kit with its baked enamel panel and crackle finish cabinet.

**HEATH COMPANY**  
A SUBSIDIARY OF DAYSTROM, INC.  
BENTON HARBOR 9, MICHIGAN

This modern-design Transmitter has its own VFO and plate-modulator built in to provide CW or phone operation from 160 meters through 10 meters. It is TVI suppressed, with all incoming and out-going circuits filtered, plenty of shielding, and strong metal cabinet with interlocking seams. Uses pi network interstage and output coupling. R.F. output 100 watts phone, . . . . . 125 watts CW. Switch-selection of VFO or 4 crystals (crystals not included).

Incorporates high quality features not expected at this price level. Copper plated chassis—wide-spaced tuning capacitors — excellent quality components throughout—illuminated VFO dial and meter face—remote socket for connection of external switch or control of an external antenna relay. Preformed wiring harness—concentric control shafts. Plenty of step-by-step instructions and pictorial diagrams.

All power supplies built-in. Covers 160, 80, 40, 20, 15, 11 and 10 meters with single-knob bandswitching. Panel meter reads Driver 1p Final 1g, 1p, and Ep, and Modulator 1p. Uses 6AU6 VFO, 12BY7 Xtal osc.-buffer, 5763 driver, and parallel 6146 final. 12AX7 speech amp., 12BY7 driver, push-pull 1625 modulators. Power supplies use 5V4 low voltage rect., 6AL5 bias rect., 0A2 VFO voltage reg., (2) 5R4GY hi voltage rect., and 6AQ5 clamp tube. R.F. output to coax. connector. Overall dimensions 20 3/4" W x 13 3/4" H x 16" D.

## Heathkit ANTENNA COUPLER KIT

MODEL AC-1

**\$14.50** Shpg. Wt. 4 lbs.

Poor matching allows valuable communications energy to be lost. The Model AC-1 will properly match your low power transmitter to an end-fed long wire antenna. Also attenuates signals above 36 Mc, reducing TVI. 52 ohm coax. input—power up to 75 watts—10 through 80 meters—tapped inductor and variable condenser—neon RF indicator—copper plated chassis and high quality components.

## Heathkit ANTENNA IMPEDANCE METER KIT

MODEL AM-1

**\$14.50** Shpg. Wt. 2 lbs.

Use the Model AM-1 in conjunction with a signal source for measuring antenna impedance, line matching purposes, adjustment of beam and mobile antennas, and to insure proper impedance match for optimum overall system operation. Will double, also, as a phone monitor or relative field strength indicator.

100 ua. meter employed. Covers the range from 0 to 600 ohms. Cabinet is only 7" long, 2 1/2" wide, and 3 1/4" deep. An instrument of many uses for the amateur.

# "LITTLE MAC" does a big job!

## Ideal trimmer for VHF range

To keep pace with the continuing efforts of the electronic industry toward miniaturization of components, Hammarlund has introduced a tiny variable capacitor, type "MAC". This component provides the low minimum capacity essential for use as a trimmer in the VHF range.

The silicone-treated base is only  $\frac{3}{4}$  x  $\frac{5}{8}$  inches. Its rotor and stator are soldered assemblies of brass, nickel-plated for low losses, while the wiper rotor contact is nickel-plated beryllium-copper. Rotor and stator terminals are positioned to permit short leads. A threaded bearing is provided with flat sides to permit single-hole mounting without turning.

The new units are available to fulfill capacity requirements between 1.4 and 19.6 mmf. Try one in your next piece of gear.

If you haven't received your copy of the Capacitor Catalog, write to The Hammarlund Mfg. Co., Inc., 460 W. 34th St., New York 1, N. Y. Ask for Bulletin C5

# HAMMARLUND

(Continued from page 76)

and VFO. LNM worked T19MHB on 160 meters with his Viking Ranger. RQK has had good luck on 14 Mc. with 40 watts out east. WN9GZS has a four-element beam on 144 Mc. CCO received his 9RN certificate. The present roster of WIN lists 40 members. YZA is active on WIN with a Viking II and an RMLE-70. WN9HYV, using a BC-154, reports an unusual 4-way QSO between 9NSX, 8NSX, 9PCY, and 8PCY. OVO would like to hear prospective EC candidates for Rusk, Barron, Sawyer, Washburn, Burnett, and Polk Counties. If there is no EC in your area, recommend a qualified candidate to the Section Emergency Coordinator, OVO. New EC appointees are KTE, Eau Claire; IYF, Dunn County; and DOH, Buffalo, Jackson, and Trempealeau Counties. FCF is building a 14-, 21-, and 28-Mc. preselector for his HQ-129. GPU, OGT, and OOL handled communications for the CAA over a 23-hour period between La Crosse and Madison, when wire facilities were disrupted and unavailable. Traffic: W6CX 265, IXA 168, CCO 118, RTP 57, SAA 41, RUB 30, DIK 23, UIM 18, FFC 16, YZA 16, IQW 13, KWJ 12, HU 7, RQM 6, SZR 6, OVO 2, SDK 2.

## DAKOTA DIVISION

**SOUTH DAKOTA** — SCM, J. W. Sikorski, W0RRN — Asst. SCMs: Earl Shirley, 0YQR, and Martha Shirley, 0ZWL. SEC: GCP. PAMs: GDE, BNA, NEO, and PRL. RM: SMV. The Mitchell ARC is affiliated with ARRL and officers are GCP, pres.; EYB, vice-pres.; GWW, secy.; GWL, treas. The newly-organized club in the Lead-Deadwood Area has chosen the name of Signal Hill Amateur Radio Club. While on a trip to California, GDE worked mobile on all bands and logged 183 QSOs. New General Class licensees in Vermillion are TMB and TLU, while ZIL is a Novice. OOP/9, EXX, GWA, QKX, and GXD demonstrated a ham station and handled traffic at a hobby show in Freeman. Ex-CSX now is 0LON at Green Bay, Wis. UVL has a call for his workshop at the State Police, ZRC, and STI answers to ZDE at home. KSW now is working for GDE. OO LXQ sent out six reports in February, and actually received a "thank you" from one of them. Net traffic: 75-meter Net (Jan.) 1105 QNI, average daily traffic 5; (Feb.) 1333 QNI, average daily traffic 6; C.W. Net 12 sessions, QNI, 107, traffic 31; 160-Net 28 sessions, 1018 QNI, traffic 104; NJQ Net 25 sessions, 623 QNI, traffic 125, SCT, operating in the 4 S.D. nets and Iowa, was QNI 109 of a possible 115 sessions. TLO received 2nd-class commercial telephone license. Traffic: W8SCT 109, DVB 16, RMV 16, SMV 13, PRR 11, GDE 10, MPQ 8, NWK 8, TLD 7, BQH 5, QKV 4.

**MINNESOTA** — SCM, Charles M. Boye, W0MXC — Asst. SCM: Vince Smythe, 0GGQ. SEC: GTX. RMs: DQL and KLG. PAMs: JIE and UCV. New converts to s.s.b. are SW, HEH, DDN, GGO, and BHY. New net time for the Minn. Junior Net is 1700 CST. Special certificates are issued for reporting in at least twice out of every three sessions. Stickers also are issued for the one with the highest traffic count each month. GTX has been appointed OPS and KLG is the new RM of the MSN. YLZ and his wife Helen have a new baby girl. The Padre Net meets Tue. at 12:30 p.m. between 3890 and 3900 kc. EOF and OTU are net controls. The roster consists of OEF, UYU, YZH, JDR, EYK, UBL, TPN, QTR, OTU, and EOF. KJZ has worked WAS on 80-meter a.w. OOO attended a radio club meeting in St. Paul. TQQ has been vacationing in Hawaii. K6EA's mother-in-law was ill in Pasadena, Calif. He tried to get a message to her so contacted WMA, who got hold of TF, at Orchard Lake, who got in touch with OA5G, in Peru. He relayed the message to VO1 in Newfoundland, who sent it to K6DDQ, at Pasadena, a former Twin City resident. Disser, Communications Officer in the CAP, has been teaching code to Novices and giving them their exams. Some of them who passed are W0NZID, ZIE, ZIG, ZHL, ZHM, ZHO, and TYO. HPV is running 500 watts. The Twin City Area Radio Clubs have joined hands and organized the Twin City Area Amateur Radio Council, or TWARC. The Council will act as an advisory group for the coordination of and betterment of amateur radio in the metropolitan area. It will unite all clubs in one group in case of emergency. OVO built a beam for WMA and RGJ and TJI erected it for him. IRJ is the proud owner of a new HQ-140K receiver. IRD is vacationing on the West Coast. RNY is planning on 6 meters and 420 Mc. OJJ is planning c.w. mobile. ZIA is a new Novice trained by QDP and QDR. Traffic: W0KLG 175, WMA 128, DQL 127, CID 124, IRJ 118, QBW 107, QNY 99, KFN 92, KJZ 83, RVO 78, MVG 66, MVH 61, TKX 47, HIN 39, KNR 39, LST 34, UCV 32, QDP 29, TQQ 27, OJH 22, TJA 22, GTX 16, VPO 16, MNC 14, VBD 13, LUX 12, NJZ 12, OGD 12, RQJ 12, NTV 11, GGO 10, NJT 8, ABA 7, BUO 7, AFP 6, FCU 6, OJP 6, OPA 5, RQV 5, MBD 4.

*Science Teacher-Ham says —*

**“My HQ-140-X is the  
best buy I ever made”**

**Fred J. Rescorl**  
Tuckahoe, N. Y.  
**W2NLC**

Fred J. Rescorl is both a science teacher and a ham, and as such can appreciate both the practical and theoretical sides of radio. Fred has been a satisfied Hammarlund customer for years, using Hammarlund capacitors and other components in home-built equipment, and now has a Hammarlund HQ-140-X receiver in his ham station.

Fred is enthusiastic about Hammarlund products. In his latest letter, he says, “My HQ-140-X is the best buy I ever made. It’s the receiver I recommend to my friends. It has performed the way you said it would — outstanding sensitivity

and selectivity, with almost no frequency drift.”

Fred J. Rescorl’s happy experience with Hammarlund products is no accident. Rather, it is the result of careful engineering exemplified in the professional characteristics of the HQ-140-X.

Be completely satisfied with your next receiver. Get an HQ-140-X! It’s available either as a cabinet model or for rack-mounting. For complete details, write to The Hammarlund Manufacturing Co., Inc., 460 W. 34th Street, New York 1, N. Y. Ask for Bulletin R5

# ENGINEERING OPPORTUNITIES AT JOHNSON

We invite QST readers to consider technical employment in the following categories made necessary by an expanding products development program.

## COMMUNICATIONS ENGINEERS ... With EE DEGREES

... or equivalent professional experience in the communications field.

## MECHANICAL ENGINEERS

... with design experience on small mechanical and electrical parts similar to those used in electronics equipment, or with methods and production experience in this field.

## DESIGNER-DRAFTSMEN

... for diversified work on equipment and components.

## ELECTRONIC TECHNICIANS

... for laboratory or production test work.

These openings result from steady growth of our company over a period of 30 years. The excellent reputation and wide acceptance of Johnson products have been the result of sound engineering, close control of manufacturing, conservative but progressive management and adequate financial strength. These factors, plus widely diversified lines, lead to job security that is unsurpassed in the industry.

Waseca offers an attractive small city environment, ideal for family life, close to work, to good schools and recreational opportunities in the Land of Ten Thousand Lakes.

If you feel you are qualified and interested in working with a compatible and highly respected group on projects ranging from component items to broadcast and amateur equipment and without the disadvantages of over-specialization and resultant boredom, write to A. M. Pichitino, Chief Engineer. We would appreciate a resume of your education and experience in your first letter together with a recent photo. All responses will, of course, be held in strict confidence.

## E. F. JOHNSON COMPANY

210 2nd Avenue, SW

Waseca, Minn.

job on 3790 kc. at 7: P.M. and we welcome more. HEE is our new PAM. Let us all help him get the Ozark Phone Net going on 3810 kc. CAM is a new General Class licensee in Pine Bluff. BUX reported on the c.w. net with a new rig and a nice signal. The Southwest Arkansas Amateur Radio Club at Pine Bluff plans a hamfest in early June. WN5HJO is a new ham in Siloam Springs. He paid us a visit. SXM is our new RM, taking the place of MSH, who was rather suddenly called to Europe on a radio job. I would like to have the news from more radio clubs. Traffic: W5SXM 54, FMF 33, WUX 6, BUX 2, PX 1.

LOUISIANA—SCM, Thomas J. Morgavi, W5FMO —LJT is new EC for Lake Charles. IHR resigned because of illness. Officers of the Southwest La. ARC are FDC, pres.; BWZ, vice-pres.; ZAK, treas.; BAK, secy. The emergency net meets each Sun. at 1400 CST on 3850 kc. Istrouma ARC's new officers are WQX, pres.; YSN, vice-pres.; ONM, act. mgr.; URR, asst. to ONM; UNQ, treas.; FMN, secy. On the morning of Feb. 26th at 0300 Baton Rouge had a successful simulated emergency. The Istrouma ARC participated using its new emergency truck complete with gasoline-driven a.c. generator for emergency power. WQX is now WFO. DUS has completed a new rig with 813 in the final. The South La. Emergency Net meets at

*JOHNSON SIGNAL SENTRY...*

## COMPACT RF ENERGIZED KEYING MONITOR!

\$18<sup>95</sup>

AMATEUR NET

Signal Sentry,  
wired and tested  
with tubes

**Performs 5 important station functions!**

<p>1. Monitors CW Signal</p> <p>2. Monitors Phone Signal</p> <p>3. Serves as "On the Air" Indicator</p>	<p>4. Mutes Receiver for "Break-In"</p> <p>5. Excellent Code Practice Oscillator</p>
---	--

Here's the ideal signal monitor for either CW or phone! Triggered directly by transmitter RF, it operates from 1.5 to 50 mc. with no tuning required. Power is obtained from the receiver or other convenient source. Connected simply by plugging into any receiver phone jack, plugging phones into monitor, and coupling RF probe to transmitter output. CW tone is adjustable from front panel, and a separate audio control permits setting monitor volume independent of the receiver volume setting. Only 3 7/8" x 3 5/8" x 3 3/4" —supplied with cables, connectors, and complete installation instructions. Uses one 12AX7, one 12AU7, and neon tube.

2822 SECOND AVE. S. W. • WASECA, MINNESOTA

# EXCLUSIVE! NEW!

## VIKING RANGER with Timed Sequence Keying

- New Time Sequence Keying
- 75 Watts Input CW • 65 Watts Input Phone
- Built-in VFO • TVI Suppressed
- Instant Bandswitching • 7 Amateur Bands

Viking "Ranger" Transmitter/Exciter Kit complete with tubes and all necessary instructions, less crystals, key, and mike.

**\$214.50 Amateur Net**

Viking "Ranger" Transmitter/Exciter wired and tested including tubes, less crystals, key, and mike. . . . **\$293.00 Amateur Net**

For the complete story on the Viking "Ranger" write for Booklet 724 containing detailed information, and schematic diagram.

*NO CLICKS!*

*NO CHIRPS!*

*CLEAN and CRISP  
ELECTRONIC BREAK IN!*

Here it is! The new, improved Viking "Ranger" with the perfect keying system. No more clicks and chirps even when driving a full kilowatt! Timed sequence keying provides ideal "make" and "break" on your keyed signal, yet VFO is keyed for fast break-in. Press the key and the VFO turns on quickly (before the keyed amplifier), and it stays on a fraction of a second after the amplifier cuts off. Wave shaping is then applied to the keyed amplifier stages for a perfect waveform. Time delay sequence is adjustable and may be set to operate so fast that a "breaking" signal can be heard between transmitted dots! Entirely electronic in operation, the system utilizes a type of grid block keying without relays and provides clean and crisp electronic keying.

Buy your Viking "Ranger" today! Truly the finest low power rig available, it packs enough power for enjoyable contacts all over the world. Later using the "Ranger" as an exciter you can add a Viking Kilowatt Power Amplifier and enjoy the ultimate in high power performance and convenience.

## E. F. JOHNSON COMPANY

2830 Second Avenue Southwest • Waseca, Minnesota

0800 Sun. on 3830 kc. The Net is under the direction of DKU, the EC, with YDC, TDY, and BV, Asst. ECs. UJK is chairman of the planning committee. HEJ, our PAM, is in the hospital at this writing. We all wish him a speedy recovery. NG, our RM, reports that Baton Rouge is not suffering for lack of new blood. A large crop of Novices are coming up. SQI received a European QSL that completes his quota for WAC. EA has a new 'scope. CEW has two new rigs on, TVI-free, and worked three new countries on 'phone. SFZ has a new 20-meter beam, three elements 50 feet high. HUT is the new EC for New Orleans. UQK resigned as EC when his new job took him to Houston, Tex. FMO recently put on a frequency measuring demonstration using secondary standard, cycle counter, oscillograph, audio oscillator, and a receiver at the Greater New Orleans Amateur Radio Club, which was well received. Traffic: W5NG 89, W5QZ 84, NDV 47, EA 39, SQI 6, ONM 5.

**MISSISSIPPI** — SCM, Dr. A. R. Cortese, W5OTD — Well, fellows, this will be my last report as SCM for Mississippi. I have enjoyed serving you for the last two years and appreciate all the help given me. Mr. Julian Blakely, your new SCM, is a fine fellow and deserves all the aid you can give him. LXV has a short beam on 20 meters. WN5GDW is on with a Heathkit and wants to work more Mississippi hams. EWE has a new 15-meter beam. TIR knows where you can get a 1000-v.d.c. generator. The Jackson Hamfest will be held the last Sunday in August. The usual good time will be had and I hope I'll see all of you there. Traffic: W5VME 92, EWE 71, TIR 34, OTD 6, RX 2.

**TENNESSEE** — SCM, Harry C. Simpson, W4SCF — SEC: RRV, PAM: PFP, RM: WQW. WQW was visited by GZ and a multitude, and visited LC, HEZ, VBA, BMI, KN4AOK, and BQG. Many Tennessee friends will miss FEL, who moved to Atlanta. WHN now has ART-13 Mobile. GFY, new General Class, is building a VFO and modulator. ZJY is building a new kw. It finally comes out — JU hasn't been on c.w. lately because the tree supporting his c.w. antenna died. HIB reports Chattanooga C.D. Exercise Interim worked nicely on both 'phone and c.w. TDZ reports a good attendance on the Chattanooga Area Radio Net. WQT has 3 new countries on 80 meters. The Clarksville Club teaches code to local Boy Scouts, shows ARRL films at meetings, and welcomes new member 9YKT. WHC, now is /KLT and is looking for Tennessee contacts. The Memphis Club Station, EM, worked the Heart Fund drive, assisted by mobiles ADM, AFB, IBG, SUG, ZKG, FYJ, STI, CV, GQO, PKI, IQX, WTI, YMB, LVM, DIX, DCH, CRP, BDK, UDI, CQO, ACK, RLU, RBL, BAO, ADY, WTI, ATQ, BTZ, HNJ, HHK, and WBK. New 2-meter Memphis stations are PKI, WTI, AFB, FRB, and FRE. The Knoxville Club's new officers are TYU, pres.; TZJ, vice-pres.; SVE, secy.; J. P. Morgan, program chairman, and PHW, publicity chairman. Oak Ridge Operators Club, Inc., operated SKH/4 at the Hobby Show. Brother Luke, an operator at YN4CB, is visiting his many friends in Memphis. Traffic: W4PL 1196, OGG 551, K4FET 265, W4PFP 231, SCF 147, WAX 118, WQW 109, SKH/4 101, CXY 91, IIB 90, TZD 90, PQP 87, BQG 78, K4FEU 72, W4ODR 52, VJ 44, YMB 40, ZJY 40, HIR 33, IVF 32, AFB 31, RRV 27, HEZ 19, TIE 19, SAR 15, UVS 15, TDZ 10, RMJ 6, BAO 5, FLW 5, ISX 5, HUT 5, UOA 5, UDI 4, GFV 3, YPG 2, NPS 1.

## GREAT LAKES DIVISION

**KENTUCKY** — SCM, Robert E. Fields, W4SBI — NIZ is really carrying the ball for the new (KPN) Kentucky 'Phone Net. The first 14 days of the new Kentucky Net operation showed these figures: 236 stations called in, an average of 16.7 stations per net; 32 messages handled, an average of 2.28 per net. Net time is 1:30 P.M. CST. Mon. through Sat. and 8:00 A.M. Sun. The frequency is 3960 kc. CDA, SEC for Kentucky, asks that all Kentucky ECs report to him the number of AREC members they have signed up. Every amateur in Kentucky should register station facilities and availability as an operator with AREC. Registration forms may be had by contacting your EC, SEC, or SCM. The Mic-Key Radio Club of Russellville has a Novice Emergency Net operating Sun. at 2:00 P.M. CST and Thurs. at 7:00 P.M. CST on 3735 kc. under the capable leadership of JHU. The Novice Net has 15 active stations at the present time. Our hat is off to you, Marvin. Traffic: K4WBG 420, W4KKW 369, K4FBW 92, W4NIZ 64, RPF 54, HSI 49, CDA 47, SBI 42, JCN 41, GFG 19, HEA 12, ZDB 12, ZDA 11, KRC 7, URF/1 5, K4AXE 4, W4SUD 4.

**MICHIGAN** — Thomas G. Mitchell, W8RAE — Asst. SCMs: Joe Beljan, 8SCW; Bob Cooper, 8AQA. SEC: GJH. With HKT retiring as our SCM I am sure that you will join me in expressing our thanks to him for a job well done and extend to him best wishes for the future. In taking over the duties of this office I pledge you my very best effort to maintain the same calibre of service that you are accustomed to. Many thanks to all who supported me in the election. There is no misunderstanding on my part that this is a one-man job. Rather, it is one of coordinating the cooperative efforts of all members in this section. Let's all keep striving to keep the fine reputation that we in Mich-

igan enjoy. Examination of the appointments file indicates a laxity on the part of some appointees to have their appointment certificates endorsed. Please be reminded that failure to keep your appointment current is basis for cancellation. It is impossible to notify each appointee when to apply for endorsement — it is your responsibility. Word from our SEC regarding approval of the Michigan Communications Plan is encouraging. As soon as it is ratified by the FCC and the FCDA, our RACES Plan can blossom into being. Many AREC registrations are being received, but many more will be needed to fill the ranks. GJH has spent much time doing the ground work so let's show our appreciation by backing him and the rest of his AREC organization with a solid membership. Remember, fellows, in the event of a disaster only those qualified as RACES stations will be allowed to help. Traffic: (Feb.) WSNUL 144, ILP 137, URM 75, NOH 73, SWG 68, IJH 66, DAP 60, QIX 59, HKT 58, PHA 54, SRK 52, WVL 49, FX 40, IV 37, OQH 27, WXO 25, ZHB 23, RAE 22, HSG 21, AUD 17, DSE 17, TBP 12, PHM 10, NTC 9, QOK 7, EGI 5, FSZ 4, TQP 4, TIC 3. (Jan.) W8IKX 44, MLR 44, IV 41, TQP 4.

**OHIO** — SCM, John E. Siringir, W8AJW — Asst. SCMs: J. C. Erickson, 8DAE; W. B. Davis, 8JNF; E. F. Bonnet, 8OVG. SEC: UPB, RMs: DAE and FYO. PAMs: EQN and HUX. DAE and FYO made BPL for February traffic. New appointments are GLM as EC, WNSUJG as OES, and MYV and OMK as OBSS. ELX is looking for stations on 20-meter 'phone in the Youngstown Area at about 2000Z. DZO will remain indefinitely in Arizona. Recently-elected Intercity Radio Club officers are HTO, pres.; OZZ, vice-pres.; and QXD, secy. MHF and NFO are the transmitter-hunting champs in Cincy, while IFX and HDA invariably finish last. VPX is the assigned call of Patterson Co-op High in Dayton. ILC has been bitten by the 2-meter bug. IHF is conducting code and theory classes for his neighbors. This is one way to alleviate TVI complaints. The Tiffin gang was scheduled to join ranks with the SVARC in Fremont on Mar. 14th to honor our fabulous SEC, PBN's Boy Scout students are making great progress, with WNSSA1 attaining a nice score in the Novice Roundup. RCJ reports he now has 33 states worked. The Lake and Geauga Club had 36 attending its annual dinner. WNSSVL's 25 watts gives the Cincy "Big Boys" something to worry about. According to DAE, the Sat. and Sun. 1100 BN sessions are bringing 'em out. The Net has procured 1000 message cards with a pool of 12 sharing the expense. This should afford excellent publicity for BN and the National Traffic System. LVE has returned to Columbus and has resumed his duties as NCS of the 2-meter FM Net. QEF did a nice job as acting NCS during his absence. You can't beat the feminine touch! New officers of the Toledo Mobile Radio Assn. are VQP, pres.; MBE, vice-pres.; MNR, secy.-treas.; and OFG, corr. secy. The *Nelsonville Tribune* gave the Hocking Valley Club a front-page spread with numerous references to Rita, HPP, Ohio's "Miss Amateur Radio." PIZ is the new activities manager of the Van Wert Club. Hamilton's *Feed Line* reports that VHS has gone mobile and that the club mobile frequency is 29.1 Mc. Dayton's *RF Carrier* informs us that ILC and RKJ are conducting code practice sessions; QFA is on 220 Mc.; Novices VGA and UVW are YLs; and the Hamvention program is shaping up beautifully. The Columbus *Carascope* states that ZYU is running high power with 80 watts; AER is operating mobile in Florida; JDK and VHO are vacationing in Florida; and WNSVFI was the leading local scorer in the Novice Roundup. The OVARA's Ether Waves has developed into a first-rate DX publication. New OVARA officers are 4EPA, pres.; 8DQC, vice-pres.; 4JBQ, treas.; 8SDJ, secy.; 4OMW, editor; 4KVV, DX editor; SDJ, v.h.f. editor; and PBU, act. mgr. The Hocking Valley *Key Kicks and Feed Back*, the newest bulletin received here, tells us that LQH has gotten on 75 meters; LGR/M worked Connecticut on 75 meters; HPP has a new romantic interest; and membership is now up to 35. Springfield's Q-5 features an article by OKB on how to work DX. The Toledo *Shack Gossip* relates that BIQ has 76 countries on 15 meters; YAE is making his home in Toledo; TLC's son is serving in the Far East; HCN has an 813 clicking on 20 and 75 meters; and OKO has deserted 160 for 80 meters. Eastern Ohio's *Ham Flashes* reports that BZW has Youngstown's first TV transmitter; PWI has returned to 10 meters; JWC has erected a 44-foot vertical; OYQ is a city detective in the Youngstown Police Dept.; the Tri-State Club meets at RZ's home every other Fri. night; and EX is attending Fenn College in Cleveland. Traffic: (Feb.) W8FYO 582, UPB 293, DAE 248, LHV 186, ARO 175, IFX 88, NIQQ 76, ILC 75, HNP 73, AL 67, LZE 58, IJH 47, MVJ 46, KDY 35, AJW 27, EQN 26, BEW 16, GZ 13, TLW 12, LMB 10, ET 9, AJH 8, AYR 8, HFE 7, OQP 7, MGC 6, QIE 6, HJZ 4, LGR 4, LZR 4, NQQ 4, PIJ 4, FBZ 3, TJD 3, HPP 2, HUX 2, RO 2, SAQ 2, WYL 2. (Jan.) W8LHV 106, IFX 65, BEW 12, PBX 10.

# Eimac 4X150A

## ...heart of the deluxe mobile rig!

**P**OWERFUL all-band operation through 420mc, top performance in double or single sideband service and more watt-hours per dollar make the Eimac 4X150A radial-beam power tetrode a tube for the deluxe mobile rig. The advantages offered by the versatility, power and reliability of the Eimac 4X150A make the necessary simple forced-air cooling well worth while—with an Eimac Air-System Socket an automobile defroster type blower is all that's needed to do the trick. With 1000 volts on the plate in typical plate modulated service, the Eimac 4X150A delivers 150 watts of useful plate power output with 200 watts of power input and only 2 watts driving power. The high power gain Eimac 4X150A is also ideal for increasingly popular Single Sideband mobile application. In typical AB<sub>1</sub> operation at 1000 plate volts, it delivers 150 watts of peak

### TYPICAL OPERATION

	Class AB <sub>1</sub>	Class C Phone
D-C Plate Voltage	1000 volts	1000 volts
D-C Screen Voltage	400 volts	250 volts
D-C Plate Current	250 ma	200 ma
D-C Screen Current	30 ma	20 ma
D-C Grid Current	0 ma	15 ma
Driving Power	0 watts	2 watts
Plate Power Input	250 watts	200 watts
Plate Power Output	150 watts	150 watts

The plate power output shown does not allow for circuit losses. The 4X150A may be operated at maximum ratings up to 500mc.

envelope power output with virtually no driving power requirement. Maximum ratings show a peak envelope power output of 350 watts with 2000 plate volts. This outstanding performance can be yours by taking incomparable Eimac quality on the road with you in the heart of a deluxe mobile transmitter.

For further information about Eimac tubes and applications write our Amateur Service Bureau.

**EITEL - McCULLOUGH, INC.** SAN BRUNO  
CALIFORNIA  
The World's Largest Manufacturer of Transmitting Tubes

The SARA is conducting a WAS contest for its members. The contest started Feb. 7, 1955 and will end on Feb. 7, 1956. K2BE has replaced his old end-fed horizontal with a 44-foot vertical ground plane on 3.5 Mc. It works FB. K2BSD is very proud of the certificate of merit he received from the 2nd Regional Phone Net. New officers of the HIIRL are AAD, pres.; K2DRN, secy.; K2AVZ, treas.; and OIT, act. mgr. K2EHI has a new 1500-watt portable power plant and two rigs operating on all bands. KN2JWM, the son of IIM, is active on 7 and 3.5 Mc. with a Viking Ranger and a Window antenna. Mike is interested in the traffic nets. Congrats to K2CIX and his new NYL. K2BOT gave an FB talk and demonstration with an electronic key at a recent meeting of the YARC. K2EDH received his well-earned Section Net certificate for activity on NYS. K2BJS, our acting RM for NYS, makes BPL again. RUF, mgr. of NYS, reports that outlets are badly needed for the area between Schenectady and Plattsburg, also in Sullivan and Delaware Counties. Attention ECs: If your appointment is due or past due for endorsement and you wish to continue, it is important that you notify the SCM within the next thirty days. Failure to do so will result in immediate cancellation. KN2GZM has a 522 on 144 Mc. K2DRN has a box of parts he hopes to whip into a Viking Ranger. K2CQS completed his s.s.b. rig. K2AJN is on 3.9 Mc. KN2HXR is building a 150-watt final designed by K2CQS. WRI is operating s.s.b. and is busy building a 300-watt final for his 20A. Traffic: (Feb.) K2BJS 601, EDH 53, W2LRW 38, K2BSD 26, BE 15, EHI 13, W2BSH 6, (Jan.) W2LRW 40.

**NEW YORK CITY AND LONG ISLAND —** SCM, Carleton L. Coleman, W2YBT — Asst. SCM: Harry J. Dannals, 2TUK. SEC: JAL. PAM: JZX. RMs: VNJ and LPJ. ZAI reports AREC/RACES activity is excellent in Brooklyn, Queens, Staten Island, Nassau, and Suffolk. Nassau 10-meter AREC is planning monthly hidden transmitter hunts. APO assisted in the Nassau-Suffolk 10-meter relay during RACES drill. VNJ has started NLT (NLI Training Net) at 1530 EST on 3710 kc. (Mon., Wed., Fri.). This is an excellent opportunity for Novices and slow-speed operators to get started in traffic-handling. LPJ made BPL again and became the sixth NYC-LI medalion winner. KEB/KFV again tops the traffic list. K2CQP made BPL and is DX-hunting on 80 meters. JOA needs Asia for WAC. OME has a new mobile antenna. Illness in the JZX family has kept Vi from being on the air regularly. K2AMP built an antennascopes. AEF is participating in propagation reliability tests requiring over 100 hours per month of operation. K2IWW became General Class. K2ECN is the new Asst. EC in Brooklyn. The BAREC Net has PNR, K2DDE, and KN2IXP as new members. K2JYL is on the air with 5 watts. BO is remodeling the shack with a new console. IN has 20-watt s.s.b. rig on 40 meters. PF would like to start an s.s.b. traffic net. Anyone interested? K2DVT is building a new c.w. and s.s.b. rig to replace the 20-watter. EEN has a new 40-foot tower for the 20-meter beam. DLO completed a 20-meter shortened beam in time for the DX Contest. K2AMM has finished the 220-Mc. converter. K2ESZ has a 6360 rig planned for 220 Mc. K2HYK plans 150 watts 'phone/c.w. IVU and IVS are competing for CD Party section honors. JBU soon will finish redecorating and will return to the NLI Net. NEG is finishing the 40-meter ground plane. LGK and K2CJP earned Net certificates for their activity in Queens AREC. KN2LIX is a new Novice at HJ. K2JPG dropped the "N." K2ANE is active from East Norwich on 40 and 80 meters. The Lake Success RC, YKO, is heard on 144 Mc. New members of the NYRC are K2s ERL, GOT HGP, IMD, and JFQ, and KN2s IAD, JVT, and LAG. K2EJM is the Fordham RC call, with AMR, NSH, RRR, K2s BTJ, IFO, IKZ, ISK, and KN2IBZ as new members. News from Suffolk County finally arrived! The Suffolk County RC officers are MZB, pres.; JFU, vice-pres.; K2BTT, secy.; and OKK, treas. OOO has a new YL. FIIX was presented with twins, a boy and a girl. TPZ became a grandpa. EX-RTZ, now SUFZ, is 8UKV's NYL. CXG is with the USAF in Mississippi. IYS is operating the s.s.b. rig on 75 meters. EAF, FTY, and MZB are getting started on 2 meters. AJF may join them. It looks like a new club may start in Eastern Suffolk, with K2EC leading the way. AJR is chasing DX on 15 and 20 meters. YBT has moved to a new house. K2BAH is looking for 220-Mc. activity in the Richmond Hill Area. New officers of the SIARA are IIFQ, chairman, GGI, treas.; IPA, rec. secy.; and VKF, corr. secy. K2EUZ has 500 watts almost ready to go. JUN has a new Terraft 2-meter converter. NEG is beginning a radio club at Seaford H.S. The New York Radio Club is holding its third annual picnic and transmitter hunt at Bethpage State Park, at Bethpage, Long Island, N. Y., on Sun. May 22nd, starting at 11 A.M. Women and children free; all OMs \$1.00. All hams are welcome and a good time is assured. Refer inquiries to CYK, picnic chairman. Traffic: (Feb.) **NORTHERN NEW JERSEY —** SCM, Lloyd H. Mana-

mon, W2VQR — SEC: IIN. PAM: CCS. RMs: EAS, CGG, and NKD. OGU has been appointed Technical Advisor to the Raritan Bay Radio Amateurs Club. K2EQD has returned from a Florida vacation. Hal also is a new OO. TTM is on the air with a new 829 in the final on 144 Mc. K2DDM is busy getting settled in his new QTH in Sayerville. Our thanks to K2BEV for keeping us informed of activities of the RBRA. COT is working on an s.s.b. rig. New hams in the Livingston Area are NMB and KN2LFD. The Teen-Age Rag-chewers Net meets Mon.-Fri. on 3525 kc. New members are invited to call in any time. KN2HXP is building a new rig with 6146 in the final. CCS is back in the swing of things after a lull in activity. Henry has just finished his term as director of TCPN. The new second-call-area director is HTD, of Red Bank. Code and theory classes conducted by the Irvington Radio Amateur Club are very well attended. Average attendance ranges from 20 to 25 each session. KN2JCA and KN2IRM have passed their General Class exams. NLY received WPR-50 certificate. K2EQP is busy with a new VFO. K2GBP is putting his mobile rig in the new car. COG receives the sympathy of the gang on the death of his mother. AYP is back in civilian life. AQC is on 144 Mc. with 1.5 watts and six-element beam. K2HHG is working DX from his mobile rig while going to and from work. K2BIF prefers working DX to writing out tickets — he's a cop! NSG, the modern ham station at Upsala College, has installed a c.c. job for Novice members of the college radio club. GTF is a complete DX station at St. Peters College with K2AEK trustee and chief of operations. KN2KJP, a student in the senior term of TV school, has been assigned the station call to match the initials of his name. K. J. Pelletier. KN2IGH has a new jr. operator, a son. KFR reports the Penn-Jersey Radio Club meets the 1st and 3rd Wed. of each month at County Court House, Belvidere. NKD is in a new QTH at Scotch Plains. OO reports were received from seven appointees this month. NIE is the proud owner of a new 20-A s.s.b. exciter. Your SEC, IIN, is going through the EC appointments and weeding out the inactive members. If your appointment has lapsed and there is no report of activity for a period of six months or more, he is cancelling the appointment. We notice that some of you still are mailing your reports to the office of the SCM at the old QTH. Please check page 6 of QST for the new address. Word has been received from ZK, aboard the *Atka*, in the form of an official New Year's greeting. The letter was received as a first-day cover from the ship's post office dated Jan. 12th and now is framed and adorns the shack wall at VQR. Traffic: W2EAS 135, K2GFX 81, BWQ 14, W2CCS 12, CFB 8, BRC 7, NIY 3, CVW 1, HXP 1.

## MIDWEST DIVISION

**IOWA —** SCM, William G. Davis, W0PP — The Waterloo Club has an activity calendar out for the full year. Good idea! Twenty-seven reported this month. New officers of the Clinton Club are KGZ, pres.; JAD, vice-pres.; USF, secy.; 9ZIP, treas. HMM has a father/son team in his classes i.e., D8T and W9WYE. The club at Luther College is progressing nicely. QLU sends in the first report I've had from an OES. BDR apologizes because there wasn't more traffic to report and he's still No. 1. HI! SCA gets his 50th BPL. We have three crowding for BPL — PZO, CZ, and LJW. Hope they make it before my term runs out. New stations on TLN are UCE, UIJ, and SQE. RJX represents TLN on TEN each Fri. night. LJW has a new 140-X. PP has a new SX-96. A new WN in Burlington is 13-year-old KN0AAH. KP4WU/ø now is W9ZOH. EHH now has a Globe Scout 40-A and an HQ-140X. New Novices at Creston are ZUZ and ZAZ. Ben Fowler, Iowa c.d. director, spoke at the Ft. Dodge Club. PAN is hoping for a BPL. HWV reports that KWT, UTD, OPQ, and HWU put on a program demonstration for the Science Club of Independence High School Feb. 10th with 50 in attendance. New hams in Waterloo are OFV, WN0ZLL, and WN0ZHA. WN0TOI is hot after his General Class Ticket. A new Novice in Des Moines is ZZM. Traffic: W0BDR 1459, SCA 1225, PZO 364, CZ 321, LJW 218, QYA 79, EHH 62, KVI 34, LFZ 33, BLH 31, NGS 23, PAN 22, RMG 21, SEK 9, HWU 6, FDM 5, UTD 4, HXA 2, NYN 1, WN0TOI 1.

**KANSAS —** SCM, Earl N. Johnston, W0ICV — SEC: PAH. PAM: FNS. RM: KXL/NYI. The WARC held its annual banquet and installation of officers Feb. 17th. New officers are BIX, pres.; WNN, vice-pres.; BVM, secy.; and IJV, treas. The Lawrence ARC held a meeting in the new quarters at Police Headquarters Feb. 25th to discuss plans for c.d. The CKRC of Salina conducts code and theory classes every Tue. and Thurs. The 1st class produced 6 Novice tickets. Also the CKRC mobile group helped the Police collect more than \$8,000 for the "Mothers March for Poho." PSL has a 20-A s.s.b. rig, making 4 for Salina. MYG visited ARRL at West Hartford. WN0ZQG, who has a Globe Scout and an NC-173, is a new station in Colby. LBJ received his RCC certificate. LQX is working for his WAS on 80-meter c.w. MOX reports 2-meter contacts with FRK, OTN, and several KC boys. KEC and ZDB, of Lawrence, have made several 420-Mc. contacts. DIU, of KXXX fame, has acquired an XYL. ECF, of Topeka, is back on the air with a new Ranger. LIX is having success with his

(Continued on page 90)

# QUALITY PRODUCTS BY **B&W**

## **JUNIOR AND HEAVY DUTY BUTTERFLY VARIABLE CAPACITORS**

B&W heavy duty butterfly capacitors pave the way for increased efficiency in single-ended and push-pull circuits, provide better L.C. ratios at high frequencies with beam power tubes. Junior butterfly capacitors are ideal for medium power triode or tetrode stage plate circuits, etc. Having 25% of the frontal area of the heavy-duty type, these units provide peak efficiency, more power, in less than normal space.

ALL OF THESE FINE B&W products are available at leading distributors' everywhere.

# **B&W**

## **Barker & Williamson, Inc.**

Barker & Williamson, Inc., 237 Fairfield Ave., Upper Darby, Pa.

## **MINIDUCTORS**

Highly efficient miniature coils offering extremely low losses and real space saving economy. Ideal for compact, high frequency circuits, mobile and portable rigs. Diameters from  $\frac{1}{2}$ " to 1", standard lengths of 2" or 3". Choice of 4, 8, 16, or 32 turns/inch.

## **COAXIAL CONNECTOR**

Permits efficient, water-tight, coaxial cable connections for antenna systems. In addition, it serves as a center insulator for a half wave doublet antenna. Ruggedly constructed of aluminum, with steatite insulation, connector withstands a 500 lb. pull.

## **DIP METER**

This indispensable instrument serves as a sensitive grid dip meter, signal generator, absorption wave meter, or signal monitor from 1.75 to 260 mc. Saves time in transmitter tuning, neutralizing, antenna loading, etc. Color coded 5 band dial matches five coils supplied.

## **BASES, MOUNTING ASSEMBLIES**

Permit compact assemblies with capacitors, jack bars, plug-in coils, and links. Available for open wire plug-in swinging links or Faraday shielded links. Assemblies include jack bar, arm and hinge, open wire or shielded link, metal bottom plate or capacitor mounting bracket.

# We can deliver from stock

## the new PANADAPTOR MODEL PR-1

the eyes of your  
modern receiver

The new smart-looking PR-1 has sufficient compensation available to provide wide-view Panoramic reception with modern receivers featuring high selectivity. Operates with receivers having an IF of 450 kc-470kc or 500 kc.

The PR-1 offers visual monitoring over a band of frequencies up to 200 kc, let's you "see" . . . everything from the other fellow's frequencies in three-way or round robin QSO's to replies to your CQ's. You see it all on a 3-inch CR Tube which also simplifies frequency setting and station monitoring, facilitates network operations, assists in making adjustments of transmitters and antenna, enables identification and interpretation of transmitter signal characteristics (your own and others), selects QRM-free spots for sending and listening.

**Features** • Visual displays up to 200 kc. wide • 3-inch Cathode Ray Tube • Phone output for use of PR-1 as a second unisignal aural receiver • Cathode Ray Tube connection for use as external 'scope.

**ONLY \$199.75 Net**

**When ordering specify model  
of your receiver and I.F.**

# The 1955 EDITION OF *THE* RADIO AMATEUR'S HANDBOOK

*A*N INVALUABLE reference work and text for everyone—hams, engineers, lab men, technicians, experimenters, students, purchasing agents.

Distributors throughout the Nation have the 1955 Edition in stock. Better get your copy of this complete Handbook now. The demand is terrific!

In the pages of this latest edition will be found, in addition to accumulated knowledge since the first Handbook was issued in 1926, the latest proved findings and experiments invaluable to ham and engineer alike. Every field of ham radio is covered: transmitting, both c.w. and 'phone; receiving; propagation; antennas; construction; theory; charts; diagrams; circuits; miscellaneous data; procedures; station operation, etc.

For instance, the 1955 Edition carries

- Chapters on Theory: Electrical Laws and Circuits, Vacuum Tube Principles, High Frequency Communication, Antennas, Modulation, V.H.F. and U.H.F.
- Chapters which include How-to-make-it articles dealing with Receivers, Transmitters, Power Supplies, Radiotelephony, V.H.F., U.H.F., Antennas and Mobile Equipment, etc.
- A separate chapter on test and measuring equipment
- 67 pages of data on vacuum tubes and semiconductors, a great time-saver to both engineer and ham
- 148 pages of valuable catalog/advertising sheets, containing manufacturers' and distributors' products and services . . . a useful supplement to the editorial section
- Plus thorough treatment of such subjects as assembling and operating a station, BCI and TVI, construction practices, etc.—and fully indexed and completely illustrated throughout. You can locate in a jiffy what you want.

► \$3.00 U.S.A. Proper. \$3.50 U.S. Possessions & Canada. Elsewhere, \$4.00. Buckram bound Edition, \$5.00 everywhere. All prices postpaid.

**ONLY THE VIKING  
MOBILE OFFERS YOU..**

**3 BIG EXCLUSIVES!**

**EXCLUSIVE**

**Single Knob Tuning**—The only commercial amateur transmitter, gang-tuned exciter through final.

**EXCLUSIVE**

**Antenna Loading System**—The only system designed for efficient coupling and transmission of power into the impedances encountered in mobile antennas! (Pi-network systems simply will not cover mobile antenna impedance ranges.) The Viking Mobile uses special, series tuned link circuits for each band ganged to a single front panel control. No annoying plug-in coils or coil tapping necessary.

**EXCLUSIVE**

**RF Fixed Bias Supply**—A feature exclusive to the Viking Mobile—Saves up to 7 amperes car battery drain while transmitter is operating!

**Most Powerful Audio**—PP807's modulating a single 807! Terrific audio punch for cutting through QRM.

**Bandswitching**—75, 40, 20, 15, 11 and 10 meters. Compact—measures only 6" high by 7" wide by 10" deep. Flexible—operates with 300 volt supply as well as with 600! Available for 6 or 12 volt operation. Dynamotor base kits for use with your dynamotor or complete dynamotor power supplies are available.

Viking Mobile Transmitter Kit, less tubes \$99.50 Amateur Net

Viking Mobile Transmitter wired, tested, less tubes, \$144.50 Amateur Net

**Other Fine Johnson Mobile Equipment**

**Mobile VFO**—Designed for steering post mounting... exceptionally stable mobile frequency control.

**Whip Lead-6**—Bandswitching Antenna Loading System. 75, 40, 20, 15, and 11-10 meters.

**E. F. JOHNSON COMPANY**

a pair of 6146s. VLE wrecked his 829B so retired temporarily from 144 Mc. ULY is a mobile member of DSDN. The IICARA meeting Mar. 18th featured a talk by Al Pichitino, chief engineer E. F. Johnson Co. BGP reports new Novices DML, DOU, OXJ, and DZC in Stratford. New officers of the Meriden Club are STT, pres.; WEE, vice-pres.; ULL, secy.; and OOC, treas. MARC has resumed publication of its *Key Klix*. ZJV reports KNT is credited with a big assist to new Novices AES, BSZ, and CLL and new General Calls to ZJY and ZJZ. BYB and VW came through with OO reports. ZFK is ready for business with Technician Class ticket. Traffic: (Feb.) WYB, BPI 141, CUI 129, AW 118, EFW 100, KYQ 99, NJM 85, LV 86, RRE 120, YYM 80, LIG 54, HYF 61, REF 44, BDI 38, ZDX 35, APA 29, UED 26, QJM 20, EDA 18, KV 17, AYC 10, RVB 7, JTD 6, WNH 6, FTM 5, GVI 4, SJ 4, (Jan.) WFTM 16.

**MAINE**—SCM, Bernard Seamon; WIAFT—SEC; BYK, PAM; WRZ, RM; OHT. The Pine Tree Net meets Mon., Wed., and Fri. on 3596 kc. at 1900 hours. The Sea Gull Net meets Mon. through Fri. on 3940 kc. at 1700 hours. The Barnyard Net meets Mon. through Sat. on 3960 kc. at 0700 hours. The OX Net meets daily at 2000 hours on 29.5 Mc. This is a true emergency net composed of eighteen RACES stations in Oxford County. The radio club over there places posters in prominent spots in the County inviting the filing of traffic. A nice note was received from LDC, who works high atop Mt. Washington at MTW-TV. BOK has been elected as assistant fire chief of Dexter. AWN, of Lincoln, is recovering from serious surgery at the Eastern Maine General in Bangor. The best to you from all the gang. Al YDX is carrying on very much alone down in Kittery on 430 Mc. He would like some contacts. WRZ is on with a fat 400-watter. The Maine amateurs again have asked the Maine State Legislature to issue them distinctive automobile license plates in order that they may be of even greater public service by being readily identifiable to police, fire, and e.d. officials. Your SCM has appointed BPI chairman of the License Plate Committee. Al and about fifty Maine amateurs appeared before the Transportation Committee and gave a good accounting of our aims and ambitions. Traffic: WWTG 102, LKP 99, UD 50, LYR 44, ZME 43, YVW 29, EFR 34, BX 20, B TY 17, YTE 12, AFT 8, WRZ 7, FKX 4, TGW 2.

**EASTERN MASSACHUSETTS**—SCM, Frank L. Baker, Jr., WIALP. New appointments: WUV Foxboro; TEF Wilmington; XZV Marshfield as ECs; TNK as OO. Appointments endorsed: LJT Brockton, RRA Winstchester, AR Belmont, VRK Swampscott, AGX Peabody, TQP Area 1 Radio Comm., and DPC Ayer as ECs; LJT as OES; QML, AGX, and WSN as ORS; HLL, MD, and AR as OPS; CTR and SPL as OBSs; and JOJ as OES/OBS. ZZX is Sautt Radio Club president. 6MU is visiting in Quincy. Heard on 2 meters: CEL, NBS, APW, ZZZ, WNI, CWB, QZF, ZED, ZGL, DPN, ZSD, ZXH, DW, DRI, CHN, and HZYK/L. KHH is on 10 meters. Heard on 20 meters: ARG, WHD, VMU, KYV, EGR, UWB, LR, and ALP. ALP has a Match Box for his Viking II. New General Class hams: AJG, BNZ, CSP, DIL, APL, ZVS, BJX, and CPP. New Tech. Class: CES, DDN, ZAX, WQH, YRI, CPW, and CQE. Novices: DPC, DWI, and DWG. ZEN/RCL visit CTR, UIR, VOU, KWD, and CTR at working on a Quad beam for 2 meters designed by MME. The Arlington C.D. Net had a checker game on the air. FWQ is Radio Officer and LLY is Alternate. The Lexington Net visited THO for Panadapter checks on mobile signals. AGX has a new QTH in West Peabody. Radio Amateur Open House had a talk by TCG on Indicating Instruments in the Ham Transmitter. Area 1 Radio Comm. held a meeting with BL, KTG, CQ, OTK, ZYK, and ALP. The South Shore Club held regular meetings. The Braintree Radio Club, DUO, held a meeting in its new quarters. WSN has a new rig for 20 meters. BGW still is on RTTY and has sked with VE2ATC on Sun. a.m. TUD and DWO are on 160 meters. DQF has her rig in her kitchen. SSA is back on 10 meters. TYU is in Quincy Hospital. CF and PIG are now K2FM and W2PIG at Hixon. N. J. VTH moved to Weymouth. DXQ now is in Quincy. TYX has a new QTH. CLF has a new wide-spaced four-element beam for 20 meters. QLT has a Viking Adventurer and RME-69. BSY gave a talk at the Wellesley Amateur Radio Society on Using All-Band Antenna with Tuned Feeders. The Buzzards Bay Cape and Islands Emergency Net meets on 145.360 Mc. at 1900 Mon. BCN is N.C. and CMT. LUM, DFO, OH, PMC, CUY, DRC, TYZ, TUV, DUL, AQN, LNR, MYE, ZGO, LYV, YTI, MFI, QVL, JNL, MNF, NKS, ZSJ, YAN, and MKW are on. KBN and UOZ are members of the College Net. The Norwood c.d. group helped out with mobile rigs when 3 Boy Scouts were lost. SIX reports a e.d. demonstration of communications at Georgetown with AFJ, WTK, KT, CVG, YXL, and WCI helping out. They used 2-meter radio units in 5 cars with one in the Central Fire Station. TTY has a Ranger kit. UKA has a new job. PIW is on 10-meter c.w. PYM will have high power on 20 meters. QMU plans a long wire in Stoughton. SXD is back at work again. UUI has a new 20-meter beam. LMU is trying low power on 10-15 meters. RM has a new mast. Newton c.d. members meet on 6 meters Sun. nights. EK has a Sonar rig at work. JOW is on 6-meter f.m. DGY has his General Class license. CGP has moved to Hialeah, Fla. The Winthrop c.d. group had the

## The "Robert Dollar" Oscillator

FIG. 1

FIG. 2

FIG. 3

International CRYSTAL Mfg. Co., Inc.

## Further discussion of the "Robert Dollar" Oscillator

Last month we discussed use of the circuit shown in Fig. 1 for overtone use; and, as redrawn in Fig. 2, as a basic Pierce Oscillator. (QST, April, 1955).

Now, if capacitor C (Fig. 2) is tuned to approach the third overtone resonant frequency, a point will be reached where the crystal ceases to oscillate on its fundamental and begins to oscillate on its overtone frequency. At this point a change in the oscillator frequency occurs, since the overtone frequency is not an even multiple of the fundamental. An increase in grid current and output on the third harmonic will be noted as capacitor C is tuned. This same circuit may be used on even harmonics, however the crystal continues to oscillate on its fundamental in this case. Thus it can be seen that the "Robert Dollar" circuit will oscillate under a wide variety of conditions and if the tuned circuit L-C is not properly adjusted, overtone operation will not be realized.

With plated overtone crystals the circuit shown in Fig. 3 provides equal or more output under similar conditions than does the circuit in Fig. 1. In this circuit the crystal will operate only on its overtone frequency and depends on the tuning of L-C.

## ONE-DAY PROCESSING

Spot Frequencies 1500 KC to 75 MC

**.01 % TOLERANCE**—Crystals are all of the plated, hermetically sealed type and calibrated to .01% or better of the specified frequency. See specifications below:

*For closer tolerance and commercial applications use the F-6 series crystal. Write for full information.*

### SPECIFICATIONS

**Holders:** Metal, hermetically sealed, available in .093 dia. pins (FA-9) or .050 dia. pins (FA-5).

**Calibration Tolerance:**  $\pm .01\%$  of nominal at 30° C.

**Temperature Range:** -40° C to +70° C.

**Tolerance over temperature range** from frequency at 30° C  $\pm .01\%$ .

**Circuit:** Designed to operate into a load capacitance of 32 mmf on the fundamental between 2000 KC and 15 MC. Designed to operate at anti-resonance on overtone modes into a grid circuit without additional capacitance load. Write for recommended circuits).

Orders for less than five crystals will be processed and shipped in **one working day**.

**HOW TO ORDER**—In order to give the fastest possible services, crystals are sold direct. However, crystals are also available by special order through your local jobber. Where cash accompanies the order, International will prepay the Airmail postage; otherwise shipment will be made C.O.D.

## PRECISION 88

**HIGH SENSITIVITY VTVM  
and ELECTRONIC OHMMETER**  
Complete with 3-way Universal Test Probe  
**PEAK TO PEAK VOLTAGE  
RANGES TO 3200 VOLTS**

A compact wide range VTVM-Ohmmeter for modern electronic circuit checking in the laboratory, on the production line and in the ham shack. Features include Peak-to-Peak voltage ranges which afford a new high in P-P reading accuracy of pulsed wave-forms in color or monochrome TV and similar applications.

### 7 DISTINCTLY SEPARATE FUNCTIONS 40 SELECTED, WIDE-SPREAD RANGES:

- ▶ **6 TRUE-ZERO-CENTER DC VOLT RANGES:**  
Constant 25 $\frac{1}{2}$  Megs input resistance.  
0—1.2  $\pm$ 6  $\pm$ 12  $\pm$ 60  $\pm$ 300  $\pm$ 1200 volts.
- ▶ **5 ELECTRONIC OHMMETER RANGES:**  
0—1000—10,000 ohms. 0—1—100—1000 Megs.
- ▶ **6 PLUS and 6 MINUS DC VOLT RANGES:**  
(Left-Hand-Zero) constant 13 $\frac{1}{2}$  Megohms input.  
0—1.2—6—12—60—300—1200V.
- ▶ **6 HIGH IMPEDANCE RMS AC VOLT RANGES:**  
0—1—2—6—12—60—300—1200 volts
- ▶ **6 HIGH IMPEDANCE P-P AC VOLT RANGES:**  
0—3.2—16—32—160—800—3200 volts.
- ▶ **5 SPECIAL HIGH FREQUENCY PROBE RANGES:**  
0—1.2—6—12—60—300 volts RMS.  
(Requires optional PRECISION RF-10A HF Probe).
- **ONE UNIVERSAL COAX. AC-DC VTVM PROBE**  
serves all functions other than HF ranges.
- **PEAK-TO-PEAK "RE-SET" PUSH-BUTTON** for rapid "zero" return of special electronically damped test circuit.
- **EXTRA-LARGE 5 $\frac{1}{4}$ " RUGGED PACE METER.**  
200  $\mu$ A sensitivity  $\pm$ 2% accuracy.
- **1% MULTIPLIERS and SHUNTS.**

**MODEL 88:** complete with detachable AC line cord, internal ohmmeter battery, coaxial VTVM Probe and operating manual. Size: 5 $\frac{3}{8}$  x 7 x 3 $\frac{1}{8}$ ". \$69.75 net

following on: UOC, BDU, DJ, OIR, MQB, NMX, VIS, DPN, DLY, DQF, DRP, HFJ, BOX, DEL, CMW, TTH, BB, BB/1, ZVO, and DUV. QUX now is in Winthrop. 4VVU/mm was heard on 10 meters coming into Boston. CTP is a new ham in Fall River on 40 and 80 meters. UE has a 522 on 2 meters. DDC will be on 2 meters again and has been on 80-meter c.w./phone working DX, F7ER and FA8DA. SX spoke on s.s.b. at the Wellesley Amateur Radio Society meeting. YVE has a Viking Ranger. WN1DOM, Quincy, has an Adventurer transmitter. AAL is now General Class. Traffic: (Feb.) WIEMG 287, UKO 202, IBE 183, EPE 112, WSN 90, LM 79, UE 49, TY 32, AVY 29, NUP 29, BY 21, BB 7, WU 6, TYN 5, AHP 2, ATX 1, HIL 1. (Jan.) W1CLF 18, BGW 10, QLT 10.

**WESTERN MASSACHUSETTS**—SCM, Osborne R. McKeagahan, W1HRV—SEC: RRX. RM: BVR. PAM: QWJ. The WM C.W. Net meets on 3560 kc. Mon. through Sat. at 1900 EST. New SEC is RRX, Holyoke. QWJ and JYH put on a fine demonstration of s.s.b. at the HCRA, Inc., February meeting. The HCRA v.h.f. gang lost to the Hartford boys in the January V.H.F. SS and the payoff held treat dinner was held at Tintis, Agawam, Mar. 4th. After the feed all went to the HCRA meeting for presentation of a gavel to the Hartford Club and enjoyed a fine v.h.f. talk and demonstration by Ed Tilton. The WM C.W. Net has been very active and efficient this winter but is badly in need of representation in Franklin County. Any c.w. men up there? RM BVR is working up a net bulletin, with DVW as associate editor. JYH, KFV, WEF, QWJ, and AJX took part in the New Hampshire QSO Party. AZW has a new NC-88. DQX has a new HRO-60. MNG is OBS on the following schedules: 3870 kc., Wed., 6:30 p.m.; 29.5 Mc.; Tues., 7:45 p.m.; and 145.2 Mc.; Thurs., 7:15 p.m. NLE has a Collins transmitter. JYH has built a set of three 813 finals for a contest rig. AOU passed Gen. Cl. New Novices are WN1CFB, CGJ, CSR, DGJ, DMT, DPZ, and DUP. 4URF/1 is stationed at Fort Devens, living and operating in Fitchburg, and has received WAS certificate and 2nd-class commercial ticket. XYV has 26 countries confirmed. NPL is building all band pi-net 813 final and reports that ICW has a new Telrex short beam. LDE says the 15-meter band acts like 10 "way back when." BH has a new 125A all-band final to follow his 10B on s.s.b. AMI is doing a fine job representing Worcester County on the WM C.W. Net. Traffic: W1UKR 199, HRV 109, BVR 106, SRM 60, MNG 52, WEF 50, DVW 37, RRX 35, AMI 30, ABD 29, WCG 12, HRC 11, WDW 11, VE 10, JYH 8, AJX 5, W4URF/1 5, W1YCU 4, JAH 2, T2EUKJ/W1 1.

**NEW HAMPSHIRE**—SCM, Harold J. Preble, WIHS—SEC: BXU. RM: CRW. PAM: AXL. The Nashua Mike and Key Club held its annual banquet Jan. 22nd. Officers elected for 1955 are UAB, pres.; YVJ, vice-pres.; YJD, secy.; QJH, treas.; NAZ, act. mgr. The 6th Annual New Hampshire QSO Party was a great success with more stations participating than any previous year. AOQ claims high score. TNO has been called to active duty with the Air Forces. PVF is now with the U. S. Army in Korea. VZS has been appointed EC for Cheshire County. CVB has received his Technician Class license. VGX is a freshman at Harvard and is working out of IAF on 20 meters. AIJ, TDJ, and LCD, all the same age with the same birthday, held their third annual party Feb. 24th at the QTH of AIJ. Welcome to Novices DDQ and DDR. The Concord Brass-pounders meet the 1st Thurs. of each month. All amateurs are invited to attend. WBM is making some changes in his station and is off the air temporarily. RCEN c.w. section meets at 1000 Sun. on 3685 kc.; the phone section meets at 1230 Sun. on 3950 kc. All Rockingham County stations are invited to participate in either net. Traffic: (Feb.) W1ARR 127, COC 91, IP 58, PFU 35, CCE 25, POK 14, FZ 13, VZS 12, AIJ 8, HS 8, CDX 6. (Jan.) W1GMH 81.

**RHODE ISLAND**—SCM, Walter B. Hanson, jr., W1KKR—SEC: TQW. RM: BTW. PAM: VXC. Activity seems to have slowed a little this month, but the regulars keep reporting. KCS is pouring 800 watts c.w. on 2 meters and maintaining regular skeds now with New Jersey and Maine. The State has plans for the purchase of considerable new gear, and that will mean increasing activity in c.d. drills this summer. The PRA Dinner Dance is to be held at Johnson's Hummocks on May 14th. VXC is looking for OPS applications. TQW has lined up ten ECs and the framework of an honest-to-goodness emergency net is already a reality. CDV has been the only Rhode Island link with the TCPN and he's looking for a successor when he leaves for duty. It's not too early to think about getting that mobile gear ready for the summer months and even more important for the fall hurricane season. Traffic: W1UTA 95, CDV 46, BNX 34, YKQ 34, VXC 16, ZXA 13.

**VERMONT**—SCM, Robert L. Scott, W1RNA—SEC: SIO. PAM: RPR. RM: OAK. At the time of writing this, there are two bills in the General Assembly of Vermont which are of interest to the hams. (1) H-181. Subject: Television Interference. Information to date leads to the belief that if FCC regs are complied with the stations have nothing to worry about (I hope). (2) H-285. Subject: Special number plates. This was introduced by Mr. Niquette of Winooski and has been referred to the Committee on Highway Traffic, where it still is at this writing. Several hams have requested the above committee to hold a public hear-

# MALLORY HAM BULLETIN

New, compact  
Vibrapacks®  
to power  
your mobile  
rigs...

Before you start working over your battery-powered gear for the outdoor radio activity that will soon be in full swing, stop in and see your Mallory distributor. He is prepared to introduce you to a new Mallory Vibrapack vibrator power supply that you can fit into almost any type of mobile equipment.

So small that it fits into the palm of your hand, this new power supply puts out plenty of wattage. It embodies design principles that Mallory engineers have learned in 25 years' experience in building vibrator operated power supplies for communications equipment. You'll find that our designers have used techniques formerly reserved exclusively for commercial mobile equipment.

Here are some highlights. The same communication-duty, series drive vibrator found in taxi, police and utility two-way transmitters and receivers is used. High stability ceramic capacitors are used in critical parts of the circuit. Heavy gauge steel protective cover and bottom plate snap on and off in an instant, to make replacement of vibrator and rectifier tube a few seconds' work even on field location. When you remove the bottom plate, all wiring

is exposed and accessible for trouble-shooting.

Special attention has been given to hash filtering in the "A" and "B" power leads. A separate external connection to the rectifier heater saves your battery during standby, and provides instant return to operation.

The Vibrapack has been designed to let you provide whatever low frequency filtering is necessary for your particular equipment... without paying for parts and wiring that you may not need. You can connect the output "as is" to a transmitter or receiver that already has its own filter system. Or, if you want to add a filter to the Vibrapack, the chassis has been punched and space allowed for the installation of a Mallory multi-section FP electrolytic capacitor.

Power ratings are conservative, to assure you of higher efficiency, peak conservation of battery power and long operation between charges.

Ask your Mallory distributor to show you the new Mallory VP (6), (12) and (24) Series Vibrapacks, and to give you their electrical characteristics. Or, just drop us a letter and we'll send you complete details.

# HOW TO IMPROVE YOUR MOBILE RIG

By Bill Cummings WIRMG

You can always do a better job and get better performance from your mobile rig by keeping up with the latest developments. When the mobile season comes round, the Dale ham staff—including Vinny Scalise W1WEV, Don Onofrio W1TYE, Charles Boynton W1ATT, and myself—start tinkering with the new gear. We can help you sharpen up your reception and work out the bugs with any setup you are now operating. We have the dynamos, filters, receivers, converters, noise clippers, squelches, mounts, loading coils, relays, cable and mikes. Drop in or drop a card, and we'll do our best.

## NORTHWESTERN DIVISION

**IDAHO** — SCM, Alan K. Ross, W7IWU — Caldwell: EYR, the local EC, aided in the search for watermelons for two Portland leukemia patients. His antenna "farm" now consists of one 44-ft. vertical for 75, 40, and 20 meters, a vertical for 15 meters, and a 75-meter folded dipole. Lewiston: IDZ is doing a little 15-meter operation. WN7YBV is getting out of town OK on 80-meter c.w. with the rig borrowed from DTJ. NOG is starting a 2-meter rig. GMC and VIO are rebuilding. Kellogg: RQG asks about the GEM Net and is willing to be NCS. Look on 3638 kc. for the Idaho gang. Gifford: VWS is going strong with DX and has 40 states worked, 30 confirmed, all on 80-, 40-, 20-, and 15-meter c.w. Boise: If we want call letter license plates for Idaho we must start to work on it now for the 1957 legislature. Everyone write to Dean Mayes, MKS, Box 486, Meridian, Idaho, who will spearhead the drive.

**MONTANA** — SCM, Leslie E. Crouter, W7CT — SFK has a new Globe King 500 and is working on plans for the Glacier Park Hamfest to be held at Apgar Camp Ground July 23rd and 24th. RIL has been transferred to Ellensburg, Wash. KUH is NCS for the Montana Weather Net Sun. mornings. MM has a new 20-A on s.s.b. Others on s.s.b. in the Great Falls Area are GCS, YPY, UWN, YLM, and DSS. RRI has moved to Butte and is with the CAA. E-FYN is now KAJ0J. FDH, with the help of JGG, put up a 30-ft. "Pop-can" vertical on the house of FDH on New Year's Day. SWE has a two-element 15-meter beam. NPV needs Asia for WAC on 15 meters. OOH has been appointed chairman of the seventh district YLRL. New calls in Great Falls are YLA, YLC, YLD, and YLM, also WN7YIO and YDY. Recent appointments or endorsements: FDH as OES, BSU as OO, EWR, PAF, and VVU as ECs. The SCM is in the process of moving to Helena and inefficiency can be expected until he is settled in his new quarters. Traffic: (Feb.) W7SFK 71, PCZ 28, EWR 12, CJN 6. (Jan.) W7SFK 82, TKB 21, CJN 8, EWR 8.

**OREGON** — SCM, Edward F. Conyngnam, W7ESJ — SEC: WAT, RM: AJN, PAM; IRZ. ESJ has assumed the duties of SCM, with WAT taking over as SEC. THX is a new EC appointee and has 12 stations lined up for AREC work around the mouth of the Columbia River. ADX is preparing for a big test this spring. A brief AREC test and drill was held in Oregon the first Sun. in February to ascertain the coverage and signal strength. Those participating were AJN, BDU, BVII, ESJ, FIN, LT, LJC, PRA, RNY, SBX, USO, WAT, and WHE. The test will be repeated on the first Sun. of each month at 1100 PST on 3585 kc. The Oregon State Net (OSN), meeting on 3585 kc. at 1830 PST daily, has made rapid gains. Attendance was 202 in 23 sessions. EZR advises that the Rogue Valley Club is now meeting in UGE's school room until the new club house is finished. Steve at GPJ expresses thanks and appreciation for the help received from all amateurs and MARS and ARS members who sent watermelons on his emergency request for two hemophilia victims in the hospital in Portland, Oregon. Traffic: W7APF 533, OKU 138, BLN 96, WAT 70, AJN 64, THX 33, HDN 23, PRA 23, ESJ 16.

**WASHINGTON** — SCM, Victor S. Gish, W7FIX — The Valley Amateur Radio Club (Puyallup) reports its annual election and banquet was held Feb. 18th. New officers are MCU, pres.; GWK, vice-pres.; UZE, secy.; VLC, treas.; SWA, trustee; WN7VZ, sgt. at arms. The Tacoma Amateur Radio Club, Inc., heard a talk on "The Role the Amateur Plays in C.D." given by Tacoma C.D. Director, Frank Evans. RGD reports further that MFG's 1/4-watt handie-talkie was heard in Eatonville; GDW will off the air as mobile temporarily while getting a new Mercury hard-top convertible; OVW was on the air with a Ranger, but the big wind came and took the antenna and chimney down; AZI is NCS of the Tacoma AREC Net the 1st and 3rd Wed. at 8 P.M. on 29.6 Mc.; band practice was held at the QTH of IMB with RGD, RXT, RXS, OVW, KKN, SKR, AEA, and IG attending. The Skagit Amateur Radio Club reports 1955 officers are PQT, pres.; REC, vice-pres.; LVB, secy.-treas. The Skagit AREC Net meets on 50.7 Mc. at 0800 Sat. BA really cut down on traffic by spending half the month in Hawaii. QYN is a new OBS in the Moses Lake Area. EVW reports he is on 40 RTTY, 20 phone, 10 mobile and MARS Nets. TIQ reports AREC activity in Vancouver really is hot with the appointments of RML as EC and RCM as SEC. ETO is contemplating all-band vertical to replace off-center Hertz and keep the antenna in his own yard. FZB and the four jr. operators had chicken pox, which allowed the OM to try out his new Ranger. AVM reports working Olympia on 2 meters but has neither heard nor worked any other 2-meter station. TGO worked (80-meter c.w.) KM6AX, VP9PL, SM8CWC, several ZLs, and YV5BJ. VAZ reports going TDY (temporary duty) in Alabama in March. ZU reports QRM on 14-Mc. phone Sun. mornings on his sked with 7PRZ/2 chased them back to c.w. PHO is working Pacific traffic with a Ranger on 20 meters. AIB is assembling a Ranger. K6BDF/7 is all shook up over the lack of discipline on the local nets. All radio clubs Wash-

FOR "40"

## 2 Element, 40 Meter MOSLEY VEST POCKET BEAM

- ★ Pretuned to 3 frequencies in 7 Mc. band!
- ★ 5 Db., or more, forward gain over reference dipole!
- ★ 19 Db. front-to-back ratio!
- ★ 1.1/1 SWR at resonant frequency!
- ★ Factory made coils wound on ceramic forms with weather-proof covers will handle full KW!
- ★ Link inductance matches 52 ohm co-ax line!

Real 40 Meter DX and effortless *solid* QSO's are yours with the MOSLEY 40 Meter "V-P" Beam Antenna!

Developed from the tried and proven *Original Design* MOSLEY 20 Meter Vest Pocket Beam, the Model VPA40-2, for the first time, provides outstanding 40 Meter beam performance ... at low cost and with an array of convenient size and weight!

### SPECIFICATIONS

- 14'10" Tubular Steel Boom with factory welded element support plates.
- 36'1 $\frac{3}{4}$ " Maximum Element Length. (61S-T6 alum. alloy.)
- 68 lbs. Assembled Weight.
- Element Sections and Element Supports pre-cut, pre-drilled for fast assembly.
- Sturdy 3" Ceramic Insulators and extra long Redwood Supports minimize element sag.

MODEL VPA40-2, MOSLEY 2 Element 40 Meter "V-P" Beam, less 52 ohm coax line, rator and mast.

AMATEUR NET **\$74.95**

Other MOSLEY "V-P" Beam Antennas include: Model VPA20-2, 2 Element, 20 Meter, Amateur Net \$55.95; Model VPA20-3, 3 Element, 20 Meter, Amateur Net \$79.95.

## Here's where the fun begins!

### Centralab Ampec® 3-stage P.E.C.\* Audio Amplifiers

*You can use them to build all sorts of exciting, miniature projects — pocket radios, mike preamplifiers, signal tracers, portable megaphones, phonograph pick-ups, hearing aids, model controls—even stethoscopes*

Yes, sir, you can really have a "picnic" with Ampec. It's the highest form of Printed Electronic Circuit and provides complete electrical service from input to output. Wiring, capacitors, resistor, and tube sockets are bonded to a single, master plate.

Even with tubes, Model 2 Ampec is smaller than a book of matches. Model 3 is smaller than a postage stamp—and it has a tone circuit, besides!

Ask your Centralab distributor to tell you more about Ampec. And send coupon for Booklet 42-142 with specifications and applications.

(Jan.) W7VCF 21.

### PACIFIC DIVISION

**HAWAII** — SCM, Samuel H. Lewbel, KH6AED — On Feb. 28th a big volcanic eruption started. YI, 3 3/4 miles from the spot, alerted the Hilo hams. AFQ, AFS, AXQ, ATT, AQE, IN, GP, AU, AUP, AYQ, AZL, and BFQ set up the net between Pahoa and Hilo. AED set up the C.D. Net with AUJ, OS, ANX, BEH, AN, AAI, and DE manning the Honolulu end for traffic to c.d. headquarters. The Hilo-Pahoa Net operated 24 hours a day from the start and at report deadline, 7 days later, was still working. All other hams in the Islands are to be commended for the way they kept the frequencies clear. Now that you have seen how an organized net can step in and handle a rush situation let's have your applications for AREC membership. I am also looking for applicants for OBS, OPS, ORS, and OO appointments. The 49th State Net reorganized in Feb., AGB is NCS. The Net meets Wed. and Fri. at 1645 HST and Sun. at 1300 on 7290 kc. with outlets for traffic on all Islands. Traffic: (Feb.) KA2GE 882, AK 712, HQ 139. (Jan.) KA7LJ 1025.

**NEVADA** — SCM, Ray T. Warner, W7JU — ECs: PEW, PRM, TVF, TJY, and ZT. OPS: JUO and UPS. ORS: MYP, PEW, and VIU. OBS: BVZ. Nevada State Frequencies: Phone, 3880 and 7268 kc.; c.w., 3660 and 7110 kc. Old-Timer ex-SCNC blossoms out with a new call, YRY, and a show of activity in Boulder City. K6BJ is expected to give another lecture, this time on VFO Construction and Single Sideband, at the Water and Power Hall in Boulder City, June 2nd. LGS is active from his new QTH in Reno. UPS, in Elko, completed his new three-element 20-meter beam. JU is preparing for some 6-meter activity with a rebuilt Channel 2 TV Yagi. SXD confines his 40-meter activities to the early morning hours. SNP, Virginia, keeps her Viking busy on all bands from 15 to 75 meters. TVF is sniping for 100 Nevada QSLs! Write to BJY if you are interested in the "Worked 25 Nevada" certificate.

**SANTA CLARA VALLEY** — SCM, R. Paul Tibbs, W6WGO — SEC: NVO. Ed Turner has just been appointed SEC and is busy organizing the section. Any club which has not been contacted and has any suggestions to make about its area and AREC problems should drop Ed a line at 2837 Fernwood Ave., San Mateo. AIT is active in traffic and will be break-in operation soon with the new system just completed. YHM got a BPL medallion for making BPL three times. EDC is building an amplifier for use on 420 Mc. using a 4X150. The San Mateo Radio Club Hamfest will be held on June 5th this year. Further details will be announced later. This column was in error some time back and it corrects this by saying that the San Mateo Club elected NUI, pres.; and QOY, vice-pres.; MIKI was named EC for the San Mateo Area. WLI is having fun on 144 Mc. and reports only two new countries were worked in this year's DX Contest. The larger the total the harder new ones come. Norm. NX is having a Collins KW-1 converted to single sideband. We advise everyone to remove the antenna coils from the receiver when Frank opens up now. The SCCARA reports there have been no new cases of TVI for some time now. The code and theory classes started in February by the SCCARA are well attended. Classes are guided by VZT and AVJ. The c.w. nets still need more c.w. operators to share the work in traffic-handling. The more of you checking into these nets the more the work can be spread around. Everyone is welcome to check in. Traffic: W4YIP/6 816, W6YHM 520, K6BBD 178, W6HC 83, AIT 18, K6BAM 6.

**EAST BAY** — SCM, Guy Black, W6RLB — Asst. SCMs: Oliver Nelson, 6MXQ for v.h.f.; and Harry Cameron, 6RVC, for TVI. SEC: Jay Amaro, WGM, 199 Harrier Street, Vallejo, EC: Les Broliar, K6EER, 1511 Laurel Ave., Richmond; J. Wayne Clarke, 770 Hoffman Ave., Napa.; Walt Stangel, FLT, Clearland Highlands; Les Sweitzer, ZZF, 121 Morningside Rd., Vallejo; Maj. Allan C. Forbes, K6GK, 4107 Brookdale Ave., Oakland; A. V. Wright, QDE, 660 38th St., Richmond. If you are not in touch with the EC who lives nearest to you, get in touch with him direct, or contact the SEC. Remember, 100 per cent amateur participation in AREC is the ultimate goal. You would pitch in and help in a real emergency, wouldn't you? Then why not say so by joining the AREC. We now have a third RM in the East Bay section, Ralph Hall, EFD, who needs no introduction to traffic men. One of Ralph's other activities has been sharing the load of sending out code practice over JZ when Ray has been away. The other two RMs, IPW and JOH, have wanted Ralph to join them for a long time. K6WAY keeps skeds with K5FKF, KL7FAF, KL7AIR, KH6AJF, and KA2JW besides regular MARS nets. K6CCQ now has 41 states with his 60 watts to an 807. ITI reports a kw. s.s.b. rig under way. IIBF and K6EPC have been appointed ORS on recommendations of the RMs. The v.h.f. gang really started making plans for 6 meters as soon as the word on the Technician privilege there was

## CHICAGO

*the World's Toughest Transformers*

**in the new  
KW-1 transmitter  
and 75A-3 receiver**

In the Collins KW-1 transmitter, where quality and performance are the only considerations, Collins chose CHICAGO transformers.

The conservative ratings and precision construction of Chicago's "Sealed-in-Steel" transformers are a complete guarantee of reliability for this superb 1000 watt transmitter. To insure excellent intelligible audio quality, only CHICAGO transformers are used throughout the audio system.

Recognized by hams everywhere as the finest in receiving equipment, the Collins 75A-3 features remarkable stability, calibration accuracy and high sensitivity. This receiver, designed for long periods of trouble-free operation, is powered exclusively by CHICAGO transformers.

Chicago's FREE Catalog CT-153, listing hundreds of stock transformers for ham, industrial and military applications is now available from your CHICAGO distributor, or from Chicago Standard Transformer Corporation.

## CHICAGO STANDARD TRANSFORMER CORP.

3501 ADDISON ST., CHICAGO 18, ILLINOIS

# Going MOBILE?? then you need a.....

60 watt peak envelope power input — SSB with switchable sidebands — AM PM CW operation — all band operation 160M thru 10M — voice control and anti trip operation available — switch for VFO or crystal — new simplified function and operating controls — complete with tubes — supplied wired and tested or in kit form — supplied with coils and crystal for 80M operation — NOVICES use fundamental frequency crystal for CW — use PE 103 or other suitable power source —

Wired and tested (with tubes) **\$174.50**  
 Kit form (with tubes) **\$147.50**

The ONLY phasing type exciter-transmitter which can drive any popular KW triode to its full KW limit is a "Phasemaster — Jr" either DeLuxe, Model-C or Kit

INDUSTRIES

408 COMMERCIAL STREET MANITOWOC, WISCONSIN  
 MANUFACTURERS OF PRECISION ELECTRONIC EQUIPMENT

received. The Oakland Radio Club heard EFT on RTTY and other Robert Dollar equipment. Prof. Lester Reukema, of the University of California, talked to the East Bay Radio Club on atomic energy. VSV talked to the SARO on 2-meter antennas. JHV moved to Castro Valley. A new active member of the 2-meter gang is NCL. ACN is hard at work at the license plate bill. Are you supporting him? PCN is the new editor of the *CCRC Calendar*. Her QTH is San Francisco. Because I have moved out of the East Bay section, to 281 Loucks Ave., Los Altos, I have resigned as SCM. However, I will continue to serve as Acting SCM until an election can be held, so for the time being send your reports to my Los Altos QTH. Traffic: K6WAY 858, FDG 522, W6IPW 152, K6GK 88, W6EFD 50, HBF 15, ITH 11, K6CCQ 4.

**SAN FRANCISCO** — SCM, Walter A. Buckley, W6GGC — The Humboldt Radio Club members are helping 14-year-old Linda Harvey (who is confined in a wheelchair because of polio) to obtain her ticket. They also are preparing the rig for her to go on the air. JSY won the Club's "California Counties Contest" (worked 43 counties). The Mt. Tamalpais Radio Club held its annual dinner at "Tommie's Place" in Novato. CDF gave a very informative talk on single sideband. YME, a technical director, will talk on the opposing side at the next meeting. K. D. Wilson received a certificate for working all California counties. HAMS still is on 2 meters but has 10 stations checking in on 6 meters each Sun. night. URA is NCS. The S.F. Naval Shipyard Club members have agreed to join HAMS on Field Day and also have invited the HAMS to join them in their annual dinner sometime in April. Membership in the SF Naval Shipyard has been opened to outsiders. Newcomers will not be allowed into the shipyard proper for the meeting night but can attend the other meeting, which is held in Red Cross Bldg. LOU, of the Sonoma County Radio Club, reports that he is busily working on plans for the Mission Trail Roundup which will be held in El Verano on June 18th. CBE, of the Larkspur Radio Club, says he worked 31 counties on 'phone the first week end. The Cathy Radio Club acted as host to the SCM at the February meeting and treated him royally in Chinatown after the meeting. The San Francisco Radio Club had John F. Honey, of the Stanford Research Institute, as guest speaker in February. He spoke on single sideband. ATO has been doing a fine job on the speakers committee and has excellent features lined up for future meetings. The Club presented GGC with a beautiful plaque. Thanks again, gang. The Ladies Club SF combined a meeting night with a baby shower for PIR. BIP was appointed chairman for the San Francisco Club Field Day activities. The 29ers Club had 17 cars with about 50 passengers at its February hidden transmitter hunt. GCV and PCN are planning a new QTH soon. DEK is back on the air after receiver troubles. K6HEZ is mobile on 6 meters. MXV is playing around with an 813. K6BJO, W6LL, JWF, GHL, K6GPX, EKF, and GGC all attended the Wasco Whing-ding Feb. 26-27. Seventy-two amateurs were there. The License Plate Committee reports that more than 300 dollars was spent on sending out literature on Senate Bill #222 and Assembly Bill #593. ACN was appointed by the Central California Radio Clubs to represent them as lobbyist at the legislature. To date a clause has been added to the original bill; that special plates are to be awarded to amateurs with mobile installations only. The California Motor Vehicle Dept. reports that the lists sent to law representatives in California cost \$75 per copy. If the bill is made permanent at this session there is hope of lowering the \$3.00 extra fee. Traffic: W6SWP 1111, GQY 234, QMO 160, GGC 26, YC 16, CBE 6, GQA 3.

**SACRAMENTO VALLEY** — SCM, Harold L. Lucero, W6JDN — The Dunsuir Amateur Radio Club elected new officers as follows: JDN, pres.; K6IVD, vice-pres.; W6IOM, secy.-treas., K6BJO, act. mgr. IVD also is EC. KTB is EC for the Yreka Area. C.d. is taking form in Siskiyou County and all towns now have an EC. The Siskiyou County AREC Net meets each Sun. at 0900. K6CFZ reports new hams in Colusa are KN6IRZ, GNJ, and IUT. K6BJV is in RACES. Colusa will be the relay point during the boat races. Stockton to Redding. K6ER is doing fine work as OO. FYK still is on 2, 6, and 440 Mc. K6BYS is EC for the Chico Area. There will be a ham get-together at Ruth, Calif., July 3-4. New officers of the Golden Empire Radio Society are MWR, pres.; IINL, vice-pres.; K6BMU, secy.; K6BSY, act. mgr. The Club has an Instructograph code machine to be loaned to radio aspirants. The Club's call is RHC, a memorial to Nola Dixon who joined the Silent Keys some time ago. MWR has re-enlisted for another four-year hitch and volunteered for another year as NVRES station-keeper in Chico. The Sacramento Council of Amateur Radio Clubs would like to have representatives from all clubs attend its meetings. The license plate bill is up during this session of the State Legislation. We hope that it becomes a law. All amateurs should write their State Senator and their Assemblyman and state their wishes. Traffic: W6OPY 33, MWR 20, JDN 5.

**SAN JOAQUIN VALLEY** — SCM, Edward L. Bewley, W6GIW — SEC: EBL. RM: K6BGM. PAMS: ZRJ and WJF. The Central Valley Amateur Radio Council meeting was held in Merced, with representatives from Stockton, Turlock, Merced, and Coalinga attending. Also present

were FYM, Central California Council president, and ACN, license plate committee. Major results of the meeting were planning unified action of FVI committees and the suggested endorsement of ACN as representative of the clubs for the license plate bill. ZNL has been appointed temporary chairman of the Council. The Sonoma group has officially formed a club and named it the Tuolumne Amateur Radio Society with EBL, pres., and PCB, secy-treas. The Bakersfield Club has, as the communication reserve, acquired two Viking Rangers, an NC-183D, a BC-221, and four beams with rotators. K6EKS is in New York with the IBM Co. JLL is active on 160 meters and is looking for QSOs. OYF is quite ill in St. Joseph's Hospital, Stockton. FIP and RLG are back on 2 meters. NQC passed the 2nd-class commercial test. OVR was NCS of SJCEM for February. KN6GTA was Maritime Mobile on 2 meters. New officers of the Fresno Club are UJU, pres.; QOS, vice-pres.; ONK, secy. The Fresno Club has received official approval of the Pacific Division Convention to be held in Fresno May 21st and 22nd. JPU is working on an ART-13 for RTTY. ZOI and BFH are going s.s.b. A group of Fresno v.h.f. men are building a 2-meter repeater station for the hills east of Fresno. Traffic: W6FEA 141, K6EVM 74, W6ADB 70, SNF 44, EBL 21, SJJ 10, WJF 8.

## ROANOKE DIVISION

**NORTH CAROLINA** — SCM, Charles H. Brydges, W4WXX — SEC: ZG, RM: VHH, PAM: ONM, OO: SOD. If you are interested in Section Net activities, join the Tarheel Emergency Net on 3865 kc. That is your ARRL Section Net and will be only as good as you make it. EIV has a new 75-A-3 and a Globe King. It sure is unusual to hear Howard not mobile. The Raleigh gang sure has been doing some hard work on the license plate bill. Show your appreciation by giving your hearty thanks. Lots of 2-meter activity is popping up everywhere. Let's hear from some of your guys on OES appointments. New stations in Charlotte are KN4BVJ and K4BZL. BZI is ex-5EWQ and is sales manager for WWOX. ZQB is moving to a new place to get a little more room for his Dixie Half Gallon. GKG has thoughts of rebuilding his 304-TL final. All who are seriously interested in forming a North Carolina phone traffic net on Saturday, please drop me a line. The Gastonia group has a monthly paper called *GAB (Gastonia Amateur Bulletin)*. It is packed full of excellent information on local happenings and may be a good idea for other clubs or groups over the State. DF has a new 20-meter beam and has been working DX. Traffic: W4RRH 25, ONM 11, BUA 4.

**SOUTH CAROLINA** — SCM, T. Hunter Wood, W4ANK — The Aiken Club has elected new officers: WSD, pres.; EQD, secy-treas.; ZVY, act. dir.; and AYD, pub. ZVY demonstrated the antenna 'scope and GDO at the February meeting. FM is building an SS rig. LXX has a new trailer with more room for a ham shack. FGX is QSY to W2-Land. SMI reports good 10-meter DX. AUL is working DX on 20 meters. TSU has a new beam on 20 meters. ULH is to be congratulated for his assistance to newcomers in Florence. WN4HOZ reports two new KNs in Greenville: BWZ and BXA. WN4HOZ has worked 42 states with a 32-foot vertical on 40 meters. TTG reports his XYL is now KN4BXH and is looking for South Carolina contacts on 3736 kc. We hear that SOF, of Dillon, is secy-treas. of the Lumberton Club. SOD is a member of the Lumberton Club, which boasts of 20 charter members. New Greenville Club officers are ASD, pres.; VUU, vice-pres.; K4AIB, secy-treas.; NJG, act. mgr.; FNS, trustee. The Greenville Club has secured the old control tower at the airport as a club house and the club station, NYK, will be on the air from this location soon. The Club boasts of 15 mobiles with 6 on 75 meters and 7 on other bands. Thanks to Virginia for the nice report. ZRH transmits code practice at 1900 EST on 3700 nightly Mon. through Fri. The South Carolina C.W. Net meets Mon.-Fri. on 3525 kc. at 1900 EST. Traffic: W4HDR 265, AKC 198, ZIZ 158, FFH 66, RPV 56, F4IL 36, ANK 25, YAA 10, FM 3.

**VIRGINIA** — SCM, John Carl Morgan, W4KX — SEC: RTV. By the time this appears, KX will have moved to Fredericksburg. See page 6 for new address. Others on the move include YS to DL4, VUF to North Carolina, CGE and YKB on a 3-week Navy cruise, LK abroad for 3 months. RTV holds a meeting of ECs each Sun. at 0800 on 3835 kc. and has appointed ZCL as his assistant in charge of c.w. AREC operations. New ORS: AAD, WYC. New OPS: RGZ, CWB. New OO: EUH. Appointees are required to suggest other likely candidates for appointments. Or if you want one, just ask. Don't be bashful. VPO and his XYL, HLF, are teaching a code class of about 20 in Orange. YE's 11-year-old son now is WN4CAX, making three hams in the family. Big brother is YZC. KAO has mobile working on all bands, while YVG says he's doing pretty well scrounging parts for one. BYZ has a new Globe Scout. KWP reports an emergency net in formation among the C. & O. Ry. employees who are hams. KFC worked T19MHB on 40, 80, and 160 meters for country No. 225. Among the Virginia gang at the banquet of "Ozone Sniffers" (old-timers) at Olney, Md. in February were AKN, KFC, KX, EBH, and NV. KN4ASU, radio instructor at Norfolk Naval Base, shucked the "N." TFZ is looking for volunteers

for ODN NCS. When you read this, the summer slump will be imminent. But this is an excellent time for the newer hams to get their hand in, in net operation, especially the c.w. nets. Get in touch with RMs TVO, PXA, or YZC if interested. We suggest you take a try at NCS—you'll find it's a lot of fun and quite easy when you get the hang of it. Anyone capable of 20 w.p.m. or better is a natural. Finally, we urge you to report any activity or traffic to the SCM each month. Regular reporting cards are available on request. Traffic: WPFCC 894, BLR 166, KX 73, YZC 71, YVG 38, TFZ 36, CFV 25, KFC 20, ASU 19, PPI 14, IA 12, AAD 11, JAU 10, CWB 6, LK 5, WYC 5, RGZ 4, BYZ 3, LW 3, CGE 2, TFX 2.

**WEST VIRGINIA—SCM, Albert H. Hix, W8PQQ—SEC: YPR, PAMs: FGL and GCZ. RMs: DFC, GBF, HZA, and JWX.** GBF has been doing good frequency-measuring work. CHP has a new Globe King. PRM is active in Bridgeport on s.s.b. and c.w. He is ex-operator from DL4AIR. ORD is on s.s.b. with 300 watts and is building kw. linear amplifier. IWB had a good article on mobile signal-strength meter in March QST. LBT is on 15-meter mobile. PQQ has a new kw. amplifier on 15 meters. GEP informs me that Princeton Club is planning another picnic-hamfest in June. UYR has a new vertical on 80 meters. TMI, in Nitro, is ex-4PHR. He is building a 100-watt linear. IXG has a new HX-129X. GBF and JWX sure did a bang-up job this month. The Tri-State Club in Huntington is very active on 6 meters. VCT is back in Texas for a short spell. ZJS is planning s.s.b. gear. LSG is planning on getting a high-power rig soon. AVW is back on and is getting a new two-element 20-meter beam. LS is doing a lot of mobile work. EOD has the s.s.b. job finished. Thanks to NLT, LS, WSL, and NRG for their tremendous help in working on the license plate bill. The hams in this section responded very well in sending in letters and messages to the Delegates and Senators. Traffic: WSCBF 642, JWX 410, GEP 84, HZA 61, IXG 19, DFC 11, LBT 7, PQQ 3, UYR 3.

## ROCKY MOUNTAIN DIVISION

**COLORADO—Karl Brueggeman, W0CDX—SEC: MMT, RM: KQD, PAM: IUF.** We now have about 1100 hams in Colorado with only 220 AREC members. There is lots of room for improvement so let's all join and see how close we can come to 100 per cent. MMT or your SCM will be very happy to send out applications, so just send either one of us a post card, and we will answer promptly. Also remember the EC check-in around the first of the month. OMN has finished this year's radio class and has three ready for Novice Class examinations. Ben will conduct a similar class next fall. WN0ZZS and KN6AAI are two new Novices from Pueblo, IUF has a new final, TVI has 41 states toward WAS, including W1AW. The Colorado nets have been having a lot of trouble lately with QRM. Most of it seems to come from hams who do not check their frequency before transmitting. Net operation is very important and can be done efficiently only if all of us cooperate. The news was quite sparse this month and as a result this week's net, Traffic: K0WBB 821, W0KQD 398, W6PKL/0 262, W0TVI 73, PGN 61, LNH 47, IA 10 IUF 3.

**UTAH—SCM, Floyd L. Hinshaw, W7UTM—The Utah license call bill has passed the House. By the time you read this it is hoped the bill will have become law! TCC expects to be back in Utah to participate in the April CID Party. JPN still is busy with defense activities and is not on the air as much as he would like. Hal is sparking the 2-meter activity in this Area. Ogden news: SAZ says that OXC has gained membership in the c.d. net. RQT has toaster interference (TIT). Hi. VHS is looking for 6-meter openings. MWR made BPL on originations plus deliveries. Traffic: (Feb.) W7MWR 242, UTM 7, (Jan.) W7JPN 6.**

**WYOMING—SCM, Wallace J. Ritter, W7PKX—**Sorry to report the failure of the Wyoming License Plate Bill S-41 to pass the House Committee. The Casper Radio Club had a very successful booth at the hobby show. The Sheridan Radio Club is starting on mobile 2-meter c.d. rigs and is getting started on RACES set-up. HLA, in a new home, should have an antenna up soon. WET is rebuilding the all-band rig. JJO was elected secretary of the Cheyenne Club and is sporting a new Ranger. SQT would like to start a 7-Mc. Wyoming Net. Two new ones at Cheyenne are WN7YVW and WN7YWW. POA, OZP, and BJS transferred out of Cheyenne. EUZ is very lonesome on 2 meters, all fired up with no one to QSO. Wyoming now has a c.w. net, known as the "YO" Net, in operation on 3610 kc. Mon., Wed., and Fri. at 1830 MST, with DXV acting net control. PKX is going on vacation to XE-Land. Traffic: W7PKX 260, DXV 65, HDS 36, MNW 20, PMH 6, XVX 2.

## SOUTHEASTERN DIVISION

**ALABAMA—SCM, Joe A. Shannon, W4MI—SEC: TKL, RM: KIX, PAM: RNK.** Section nets: AENB, daily at 1900 on 3575 kc.; AENP daily at 1800 on 3955 kc.; AENB C.W. operates at a speed of 15 w.p.m. on Sat. and Sun. and welcomes newcomers. Four stalwarts hit the BPL trail in February: K4FDY, W4COU, HKK, and UHA.

(Continued on page 106)

# JOIN THE LONG-LIFE FAMILY

When you rebuild, see how many of these Los Gatos favorites will fit your new circuitry. Or, use them when re-tubing.

You may be surprised, and you'll certainly be pleased with the additional nine-plus lives you'll get from these carefully-made electron tubes.

Ask for them at your jobber. If he doesn't have them, he can get them for you — overnight in most locations.

COU is experimenting with a Franklin Oscillator. ZSQ was voted the most efficient NCS on AENP for February, and RTQ the outstanding net member for the month. WOG has moved to a new location and FAJ is now living in Coral Gables, Fla. ZWE is signing portable from York. After four tries at 'phone patches, ZSQ says he can now offer his services in Birmingham! Welcome to KN4ASG, Winfield, and KN4CCI, Anniston. TKL has a new Chevie and the job of converting mobile to 12 volts and reinstalling. CAH says he has worked VP5AE, Grand Turks Island, on 15 meters! RLG is back in the traffic column after a year's absence. Traffic: K4FDY 1158, W4COU 602, HKK 516, UHA 449, YRO 69, EJZ 60, WOG 59, ZSQ 52, KIX 48, K4ACO 27, W4ZSH 26, OAO 24, TKL 24, YAI 24, RNX 21, BFM 14, CEF 14, PWS 14, TXO 14, HYI 12, DXB 10, JKU 6, CAH 4, OR 4, RLG 4, USM 2, USM 2.

**EASTERN FLORIDA** — SCM, John W. Hollister, jr., W4FWZ — Our SEC, 1M, is planning on May 15th for JOCO. A nice report was received from PJU on the LJM transmitter fund. The B&W 5100 was delivered Feb. 27th and set up by DPD, DDW, CPG, and VIE. Because TOJ was listening, a dying child in Oregon received her wish to taste some Florida watermelon via Eastern Air. The three foregoing disassociated ham activities certainly point up our belief in our hobby and my belief in the amateur. Ye SCM got first-hand information on some good things in store for those heading for St. Petersburg in June for the ARRL Convention. An enjoyable evening was spent at the SPARC meeting. Ft. Lauderdale: The Flamingos are aiming to please the gals in their outings this year. Bird Sparks: VGT is building a new shack. TOJ uses an SX-88 with a Globe King and TOK uses the NC-183. WAQ uses B&W 5100 and s.s.b. on 20 meters with Telrex two-element Mini. Thanks to SDI/MVR for the TOJ-Oregon story. KN4BXR is 15. WN4HRU is NCS for 3735-ke. Novice division of Broward Emergency Net, Gainesville: TJU reports new GAS officers are K4AQR, TJU, WEM, WEM, the EC, has 7 mobiles in the GAS Net. TJU says the gang is getting polished up for Field Day (June 25-26). Jacksonville: CNC reports NEK has nice skeds, so drop him a line. Key West: We are sorry DRT is moving on. ELS says club station K4NCN now has the beam up. Miami: Thanks to IYT and PBS for the honorary DEN certificate. PBS and IYT report the DEN drill of Feb. 28th was a big success with 11 mobiles. Key men included PBS, YCL, UIW, CUR, and IYT. Renewed 144-Mc. activity brought in FLH with 600-watt duplex with KQG and ZDR. RNV also is on 144 Mc. CUR says AZO is on 144 Mc. with 500 watts and reports a new club, the South Miami Radio Club. YJE uses B&W 5100. Orlando: BMY is building a new shack and console. Tampa: 2JWJ swears by his rhombic. Norm says KL7AWH died in Clearwater. Traffic: (Feb.) W4TYE 679, IYT 585, PJU 526, LAP 340, DVR 262, WEO 190, WS 123, WHK 103, ELS 79, YJE 65, TJU 54, FSS 40, LMT 34, ZIR 32, K4ANJ 27, W4RWN 27, FJE 20, IM 14, FWZ 12, NEK 12, YOX 12, DES 5, BWR 4, YNM 2, DRT 1. (Nov.) W4PJU 524.

**WESTERN FLORIDA** — SCM, Edward J. Collins, W4MS/RE — SEC: PLE. ECs: HIZ and MFY. CQX sends an FB report on the Novice program. New Novices are KN4s BMQ, BNA, BKP, BRQ, BQY, BKU, and BKW. 9CPI now is K4BZX. CQX is coming on with a kw. MUX has been burning up 75 meters. KWM rebuilt the kw. rig for 20 meters. RKH and PLE are cleaning up TVI in their rigs. ROM has a new 10-meter rig. SMM has the new mobile rig going. UXW is on 10-meter mobile. WKQ is getting all set for Field Day. PLE is looking for ECs for the central and eastern parts of this section. HQG is a traffic man on 75 meters. BGG has a car and is dreaming of mobile gear. MS has a new B&W but KN4AGM claims it. HI. QK has the 813s booming on 75 meters. UCY is after higher power. NJB is on again. JPD swears by the 40-meter band. TTM is very active in the YLRL. KN4ADY is getting the rig set to come on the air. 6UQZ is in the area again after 18 years. VR keeps 40 meters going along with ANP. OOW is renewing his ticket. RZV is faithful to the Dagwood Net. UCY is happy over the 10-meter openings. YFF, YFG, and YFH have antenna problems. Traffic: K4AKP 341.

**GEORGIA** — SCM, George W. Parker, W4NS — SEC: OPS. PAMs: ACII and LXLE. RMs: MTS and OCG. Nets: Georgia Cracker Emergency Net meets on 3995 kc. Sun. at 0830, Tue. and Thurs. at 1830 EST. Georgia State Net (GSN) meets on 3590 kc. Mon., Wed., and Fri. at 1900 EST. CCM has a new 500-watt rig. It is a new YL at QDM. DJF is working on a kw. sideband rig. BVE is working on a modulator for his c.w. rig. KN4BXD is a new Novice in Jackson. YTO made WAS. CFJ sold his kw. sideband final and is building a new one. A new club has been organized at Quitman High School. KN4BBI is new in Bainbridge. New officers of the Thomasville Radio Club are NDX, pres.; ZDP, secy.-treas. The South Georgia Rag-Chewers Net held its annual picnic meeting in Thomasville. The Southeaster Single Sideband dinner was held in Atlanta on Feb. 19th with more than 70 sidebanders in attendance. KN4s ADV, AYC, and BAI are active in Columbus. YUM has a new 35-ft. pole in his backyard and is active on 15 meters. MTS is building a sideband rig. DOC has a new 32V-2 and a 75A-3. RVH now is mobile. ZUF has a new

## designed for GROUNDED GRID

PL-6569 is a new high-mu triode, designed especially for grounded-grid amplifiers. It is THE choice for a 1-KW amplifier to follow a "100-watt" transmitter.

Its high amplification factor ( $\mu=45$ ) and its high perveance mean a power gain of *ten or more*. More than 800 watts output, with only 75 watts drive!

PL-6569 is conservatively rated at 250 watts plate dissipation. Its low plate-to-filament capacitance ( $0.10\mu\text{mf}$ ) makes for real stability as a grounded-grid amplifier.

**PL-6569**

A technical data sheet, giving ratings, typical operating conditions, suggested circuits . . . including single-sideband data . . . is available. Ask for Data File 301.

# PENTA

LABORATORIES, INC.  
312 North Nopal Street  
Santa Barbara, California

beam on a 35-ft. telephone pole and is after that rare DX on 20 meters. YU1GM (GMP) works the home town regularly from Belgrade. HYN, in LaGrange, is back on the air on 75 meters. All appointees are requested to check appointment expiration dates and forward their certificates to the SCM for endorsement if over one year old. Traffic: K4WAR 706, W4CFJ 320, PIM 315, BVE 225, ZDP 64, BWD 30, NS 22, MTS 20, ZD 14, K4BGB 10, W4YTO 2.

**WEST INDIES** — SCM, William Werner, KP4DJ — KD renewed ORS appointment. The appointments of HZ, QR, and KG4AO have been cancelled because of inactivity. ZW is preparing to get on 75 meters to QSO Island stations. SK, one of our co-workers and an old-time amateur, has gone back to W2-Land. ABC has a new Viking Ranger working on all bands. W2ADD visited WV at Aquadilla. W2TO visited AZ, MP, C.D. Radio Officer, is active on 75 meters. RA has returned from a long visit to the States and promises early activity. WD made WAC'-phone. YT has a new HRO-60. DA is active on 7 Mc. DV and ZW are working feverishly in the c.w. portion of the DX Contest. ACB, with the highest QTH in KP4 on top of a mountain near Castaner, applied for amateur weather observer appointment to report to the Antilles Net. ABA has 40-meter vertical. US, ZC, AAA, ABA, ABD, and ACB visited the SCM. AAA is CAP Radio Officer. KD has a new 80-meter Zepp and reports working 64 countries on 3.5 Mc., 86 on 21 Mc., 18 countries and 4 continents on 1.8 Mc. US and ABA were subjects of a two-page write-up in a newspaper printed by the Dept. of Instruction with an 8 x 10 picture in color on the front page. AZ has a new Lyco Transmaster. Traffic: (Feb.) KP4WT 76, ZW 8, DJ 2. (Jan.) KP4WT 90.

**CANAL ZONE** — SCM, Roger M. Howe, KZ5RM — AU and FL moved into new homes in the new housing development on Ridge Road. They are practically across the street from each other, but both claim this is not going to cause trouble because they are going to install a special switch which will automatically lock out the other's converter for a half hour. The ham gang surprised ML and FL with a house-warming party at their new QTH. New license application forms are in the making and shortly will be available at the Cristobal, Margarita, Balboa, and Balboa Heights Post Offices. They also will be available at either of the two radio clubs. JW, CZARA club station, is in business with the interlaced 10-20 beam. SCM, RM, and his XYL, KA, will be on leave Stateside from the end of May to the end of August, during which time SEC, WA, will act as SCM. Traffic: KZ5WA 118, DG 52, CF 30, KA 22, LB 11, GD 9, BD 8.

## SOUTHWESTERN DIVISION

**LOS ANGELES** — SCM, Howard C. Bellman, W6YVJ — Explorer Post No. 177, SLW, worked PY4DK with its 500-watt Grayhound Mobile. These boys are all physically handicapped. KN6ICF's best DX is WN7YHD, in Montana. All scouts are invited to take part in radio classes at the Lowman School, North Hollywood, 7:30 to 9:00 P.M. Fri. QJW reports that the ECs in the southern part of Los Angeles County are participating in the American Heart Campaign by providing mobile units to pick up money from the volunteer workers. Two W6s were heard by 5FAG, Albuquerque, on Feb. 18th, according to ORS, who worked FAG on the 21st on 75 meters. Apparently this was caused by ionization from atom blasts. K6BAG, the Mt. Pacific Radio Club, is scheduled for the mountain of the same name next Field Day. K6JLY, publicity secretary of Hamilton High Radio Club, indicates that the Club's constitution now includes words which provide for expulsion of any member known to be "bootlegging." *The Oscillator*, from Long Beach, reminds us of the YLRL Convention to be held at the Miramar Hotel in Santa Monica in June. New calls for "Riohons" include K6JLS, TV technician at Lovell's, a recent graduate of the code class. Russ is on the Novice c.w. bands. Tom Lovell, sr., father of KN6IPD, is now KN6JRH and has worked San Francisco with his Heathkit. Another father and son combination will be Pres. Beaird, who recently passed the Novice exam and is awaiting his call, and his son, Gil, now General Class with the call K6IMF. Gil is on 40-meter 'phone with a Globe Scout. KN6IMG is bringing his dad around to code classes. The Jennings family, father and two sons, are making progress toward 5 w.p.m. Thanks for the report from UKC, of the *Riohon Listening Post*. FMG has asked for cancellation of his ORS appointment as he expects to be very inactive in ham radio circles in the near future. Traffic: (Feb.) W6MBW 225, USY 234, GYH 210, KDQA 172, W6CAK 139, KN6HOV 104, W6MLZ 100, CMN 91, BHG 70, ORS 66, K6COP 32, BWD 31, W6CK 28, HIF 12, CBO 5, FAI 3, K6BEQ 1. (Jan.) K6FCZ 945, W6FAT 6.

**SAN DIEGO** — SCM, Don Stansifer, W6LRU — Asst. SCMs: Tom Wells, 6EWU; Shelly Trotter, 6BAM; Dick Huddleston, 6DLN. SEC: VFT, ECs: BAO, BZC, DLN, HIFQ, IHL, HRI, IBS, KSI, KUU, and WYA. RM: ELQ.

(Continued on page 110)

JAMES Model  
C-1050 Vibrator  
Power Supply com-  
plete with vibrators,  
fuses, rectifiers.

Wired and Tested.....Amateur, Net.....\$49.95  
Kit Form .....Amateur, Net.....\$39.95

The new JAMES "Dual Operation" vibrator power supply for amateur mobile service, with commercial communications features . . . using dual vibrators, oversized transformers, selenium rectifier, the pack is ruggedly assembled for long trouble-free service on mobile installations.

- 6/12 Volt Operation
- 95 Watts Output
- Hash Free Receiver Power
- Antenna Relay Power
- Receiver Muting Relay
- Transmitter High & Low Voltage
- Selenium Rectifiers
- Dual Standard 4 prong, 6 volt Vibrators

See your Radio Parts Distributor or write directly for  
specification catalog.

# JAMES

VIBRAPOWER COMPANY

4036 N. Rockwell St. • Chicago 18, Ill.

The entire San Diego section mourns the recent passing of Johnnie and Neva Fredenburgh, VJQ and YX1, who were killed in an auto accident. K6JCF, ex-W4VZH, is now in Del Mar. KN6JGH is a new Novice in Vista. Officers of the Gillespie Club are K6ILO, pres.; W6KUU, vice-pres.; and K6DXZ, secy. The Rohr Club now has a Viking II on the air. SKB is recovering at home after a recent auto accident. The Convair Club has a Collins 32V-3 on all bands. K6CTQ worked 12 new countries in the DX Contest on c.w. BSD is now handling traffic on RTTY. The Orange County Club is conducting code and theory classes in cooperation with c.d. in the area. K6DNO now sports a BC-342 while KN6HKY has an NC-183. LYF has a Ranger. FJH, our ex-SCM, is now in Arcadia. All clubs continue to show activity preparing for Field Day. The club call for the new Gillespie group is K6JCC. SYA and his XYL recently vacationed in Death Valley, but came home early because of the intense cold. The meeting space for the Convair Club will be doubled in a new building soon to be completed. VFT is back at his normal duties of teaching after an enjoyable trip East to receive the Edison Award. A 9- and an 11-year-old at Silvergate Elementary School passed their Novice tests and are awaiting calls. All persons holding appointments in the section are asked to send certificates to the SCM when they expire so they can be endorsed and returned. This would help me to keep my records straight. Traffic: W6IAB 3350, YDK 621, BSD 599, IZG 91, K6DBG 32.

**SANTA BARBARA** — SCM, Vincent J. Haggerty, W6IOX. K6NBI still is the traffic leader in this section. QIW says poor conditions make for hard work on the traffic nets lately. Activity at FYW is limited to CAIRS and local contacts presently. AGO skeds the East Coast on 3.5 Mc. BRY's brother is now K6END. IID is finishing his s.s.b. final amplifier and working on a 2-meter receiver. Members of the section are urged to give their support to QIW, your new SCM as of April 12th. Congratulations, Bill! Traffic: (Feb.) K6NBI 93, W6QIW 8, FYW 4, (Jan.) W6QIW 26.

## WEST GULF DIVISION

**NORTHERN TEXAS** — SCM, T. Bruce Craig, W5JQD — SEC: RRM. PAMs: PAK and IWQ. RM: PCN and QHI. SQX has returned to Lubbock and Reece AFB. BSX reports 15 members of the Cleburne Club have a project of 5-10-meter transmitter-converter to tie in with the Sheriff's Dept. WB has given more than 400 exams in the past 25 years. New officers of the Snyder Club are FPH, pres.; COU, vice-pres.; CRP, secy.-treas. CDO has cubical quad on 20 meters. BXE has moved back to Snyder. New officers of the South Plains Amateur Radio Club at Lubbock are NGX, pres.; TUW, vice-pres.; and IIDX, secy.-treas. OBS is in Germany. GLX is a new YL ham in Tyler. AJ renewed his commercial license. IMQ worked Canal Zone on 35-watt 15-meter home-spun rig. The Blue Ridge Net, on 160 meters, had an 88 per cent attendance on 1880 kc. for February. UUR reports on the annual Boy Scout Ham-oree held Feb. 20th, conducted by No. Tex. Emerg. Net. Code classes are being conducted by amateurs and Naval Reservists each Tues. at 7:30 P.M. in the Naval Armory, Lubbock. TFP reports WN5HHK's father is WN5KAS, Dallas. YL YKE worked YL KZ5DG in Canal Zone on 15 meters. BMR reports on the early morning ham breakfast held each 3rd Sun. at the Piccadilly Cafeteria in Fort Worth. CF worked into the No. Tex. Liaison Net from mobile while en route to the Lawton Hamfest. QGR, Midland Club president, reports the City decided land to the hams for the new club house they are building. NRI is back on mobile after being off when s.s.e. took his fancy. GVA is all-band mobile. ESR is back on NTEN after recent surgery. GQN has organized the TNT (Texas Novice Traffic Net), which meets at 1900 CST each Tue. on 7191 kc. Traffic: K5FFB 870, W5KPB 366, DTA/5 355, BAT 212, PAK 196, AHC 187, UBW 160, ACK 136, CF 129, BKH 122, OCV 37, YKE 27, ASA 26, HKF 7.

**OKLAHOMA** — SCM, Dr. Will G. Crandall, W5RST — Asst. SCM: Ewing Canady, 5GIQ. SEC: KY. RM: GVS. PAMs: PML, SVR, and ROZ. The Lawton-Ft. Sill Radio Club Hamfest and Dinner held at the Hotel Lawtonia was the highlight of the month with both the newly-elected Director, CF, and the Vice-Director, MA, present and making short talks. PML was M.C. and allowed your SCM and SEC, KY, to say a few words. A total of 94 attended the dinner with about 35 ARRL members present. KY is doing an exceptional job in lining up and training ECs for as many counties as possible and now has over 60 per cent of the counties covered. The usual tornado path from the S.E. to the N.W. across the State is almost completely covered. The tornado season has begun and the progress of the squall line is being followed by a storm-warning net, with CZB as originator and NCS. A tie-in with the state weather bureau is in the process. The North Fork ARC has set the date of its annual hamfest and picnic at Quartz Mt. Park as May 21st and 22nd. Your SCM has been remiss in notifying ARRL appointees of expiration of their appointments, but appointments will be made on the recommendation of the RM, PAM, or Net Mgr. if application is made for OPS, ORS, or OPEN certificate. Traffic: W5GVS 143, MRK 83, FEC 69, ADC 56, GXH 41, TKI 44, MGK 41, (Continued on page 112)

# HARVEY PRESENTS CENTRAL ELECTRONICS EQUIPMENT for AM, CW and SSB

## NEW BROAD-BAND Linear RF Amplifier Model 600L

The 600L has no tuning controls except a single knob selector covering all amateur bands from 10 through 160 meters. Requires only 2 watts effective or 4 watts peak envelope drive power for 500 watts dc input. New band-pass couplers provide 60 to 65% linear efficiency. Uses single 813, class AB<sub>2</sub> and has automatic relay to protect 813 and RF couplers.

New meter features include: reads input power directly in watts . . . reads grid current . . . reads output in RF amperes . . . shows reflected power due to mismatched load . . . input level calibrations for AM, PM and CW. Function selector knob switches meter to any reading while transmitting.

Has built-in power supply with excellent regulation of bias and screen voltages. The 600L is effectively TVI-suppressed with thoroughly shielded and bypassed RF compartments.

Available in either table or rack model.

Complete (factory-wired) **\$349.50**

## New 'Q' MULTIPLIERS

A tunable IF electronic filter that provides tremendous receiver selectivity for peaking or rejecting signals on AM, CW or SSB. Employs new 2-tube circuit with high-Q inductor. Continuously variable from 60 cps to normal IF pass-band. Interfering carriers attenuated up to 50 db.

AQ

DQ

**Model AQ** — Designed for installation in Model A Slicer. Includes new front panel. Power-IF cable plugs into accessory socket.

**Kit** **\$22.50**  
**Wired** **\$29.50**

**Model DQ** — Designed for use with any receiver with 450 to 500 kc IF. Has power-IF connecting cable. Power requirements are 225-300 vdc at 12 ma and 6.3v at .6 amps. Can provide additional selectivity and 8FO for mobile SSB or CW reception.

**Kit** **\$22.50**  
**Wired** **\$29.50**

## SIDE BAND SLICER Model A

Permits selectable SSB reception on any receiver with 450-500 kc IF. Cuts QRM and reduces interference from 15 kc TV harmonics. Has built-in power supply.

**Kit** **\$49.50**  
**Wired** **\$74.50**

**AP-1 ADAPTER** — Plug-in IF stage for use with Slicer. Allows receiver to be switched from SSB to normal.

**Wired** **\$8.50**

**AP-2 ADAPTER** — Combines AP-1 and crystal-mixer for use with receiver having 50, 85, 100, 915 kc or other IF systems.

**Wired** **\$17.50**

## SIDE BAND SLICER—Model B

Complete Sideband Slicer same as Model A, but including built-in 'Q' Multiplier. Does not require AP-1 Adapter.

**Kit** **\$69.50**  
**Wired** **\$99.50**

**Harvey Ships Everywhere  
in the World!**

## Model 20A MULTIPHASE EXCITER

20 watts peak envelope output on AM, PM, CW, and SSB. Has single switch for sideband selection. . . VOX on AM, PM and SSB, plus break-in operation on CW . . . bandswitching, 160 through 10 meters . . . magic eye indicator for carrier null and peak modulation . . . plus many other features. Choice of table or rack model.

**Kit** **\$199.50**  
**Wired** **\$249.50**

## Model 10B MULTIPHASE EXCITER

10 watts peak envelope output—AM, PM, CW and SSB. Uses plug-in coils. Improved version of earlier 10A.

**Kit** **\$129.50**  
**Wired** **\$179.50**

**Write for HARVEY's  
1955  
HAM CATALOG

## Model QT-1 ANTI-TRIP UNIT

All-electronic VOX break-in anti-trip unit for use with loudspeaker. Prevents loud signals, heterodynes, etc. from tripping voice break-in. Plugs into socket of 20A or 10B Exciter.

**Wired** **\$12.50**

## 458 CONVERSION KIT

Basic 458 conversion parts kit, 15 to 160 meters with dial, etc.

**Kit** **\$15.00**

**Case and Panel Kit**  
for 458 conversion **\$10.00**

## New—For 10 Meters Model 458-10

Crystal-controlled converter package to extend 458 VFO into 10-meter band. For use with 458 Conversion Kit.

**Kit** **\$27.50**  
**Wired** **\$37.50**

## DELUXE CODE PRACTICE OSCILLATOR

With Built-in Key-Click Filter

In Kit Form  
or Wired

The AMECO Code Practice Oscillator, for 110 volts AC or DC, with a built-in 4 inch speaker, produces a pure, steady tone with no clicks or chirps. It can take a large number of headphones or keys. After the code has been learned, the AMECO code practice oscillator is easily converted to an excellent c.w. monitor.

Other features include:

- Variable tone control
- Volume control
- Sturdy grey hammertone cabinet
- Lowest prices

In Kit Form, with Instruction, less tubes (Model CPS-KL).....\$11.75

Completely Wired & Tested, less tubes (Model CPS-WL).....\$12.95

Set of two tubes (35W4 and 50C5).....\$ 1.80

**SOUTHERN TEXAS —** SCM, Dr. Charles Fermaglih, W5JFF — ABQ, who has been in bed for a very long time, is now up and around again and beginning a full kw. rig just for 80-meter c.w. Good luck to you, Jerry, and we are all happy that you are recovering. URW is doing a lot of MARS and NTO operating and soon will be heard on STEN. The next Annual STEN Meeting will be held in Kerrville May 28-29. From *Gutter Dope*: FND and his XYL are moving into a new home on the north side. V1 is sporting a new mobile on 75 meters and a new QTH out on Fredericksburg Rd. EPB is building a new Q multiplier. TIU has just installed a new Elmac transmitter in his mobile. We wonder if JHH has his car painted yet, and how about the 24-volt system? GK1 is ready to fire up an ART-13 mobile. Emergency Net NCS, KQG, has recovered from laryngitis. EVT is having lots of fun operating his new Viking Ranger. LVE is mounting his put-put on a new trailer. OER reports 3855 kc., the mobile frequency, is crowded in Houston. TSE says we should be seeing LFG soon. The Galveston County ARC is doing an FB job of publicizing amateur radio. ULN presented a program on oscillators. The Club call is KMK and Campbell is trustee. The GCARC had an FB picnic in March. Elder, Judd, and Bolles were the committee. New Novices in Galveston County are Mr. and Mrs. W. C. Fulton and Jimmy Taylor. WN5JSV, and OM, WN5JSU, share the same station. Jim's call is WN6GMX. DJG, a 13-year-old YL, is thought to be the youngest in Texas. AET has moved to a new QTH in Pharr and is loading up the clothesline pending completion of an antenna. FZO is back on the air with his numerous transmitters but he still is having some trouble. The hams in Hidalgo County participated in the Red Cross simulated disaster Mar. 5th. DTJ is on 40-meter 'phone and c.w. with 60 watts for the first time since 1951. It is his first 'phone rig since becoming a ham in 1933. At a recent meeting the HARC elected RPW, pres.; Sam Dixon, vice-pres.; FZD, treas.; URU, secy.; PBX, membership chairman; VWF, prog. chairman. Traffic: W5MN 631, FJF 42, ABQ 16, URW 16.

**NEW MEXICO —** SCM, G. Merton Sayre, W5ZU — SEC: KCW, PAM: BIW, V.H.F. PAM: FPB, RM: JZT. The NMENP meets on 3838 kc. Tue. and Thurs. at 1700, Sun. at 0730; the NM Breakfast Club every morning except Sun. 0700-0830 on 3838 kc.; NM C.W. Net daily on 3633 kc. at 1900. Changes in NCS for the Breakfast Club: Mon. ZGG, WKX; Tue. TBP, BZB; Wed. CEE, AK; Thurs. WBC, GYN; Fri. CEE, VLZ; Sat. PSP, CXN. WBC is NCS for Tue. and Thurs. NMENP, with CXN alternate; GEM is NCS Sun.. BXP is alternate. BIH and FPB are candidates for the SCM post. Remember the State Ham Picnic at Albuquerque June 4-5, the West Gulf Division Convention at Fort Worth June 10-12; and Ruidoso in 1956 for the West Gulf Division Convention site. AQQ has left the State. NMENP stood by for three days when Albuquerque amateurs provided communications in connection with the TWA plane search and rescue activities in the Sandia Mountains. Caravan Club members did a grand job. WIY and CGE moved to Mojave. DNK, ECS, FAG, FPB, HAG, NSJ, RKS, UEO, UZL, WIY, YXM, and others were at the Feb. Albuquerque V.H.F. Club meeting. FAG and NSJ are trying to work DX after each Nevada test. SB is in Farmington as a TV engineer. GUB attended Chicago school on microwave and teletype maintenance. PBV works on u.h.f. gear for CAA. PO1 lost his whip and coil in a snow storm. AAU has a communications service in Farmington. Traffic: K5WSP 268, W5RFP 54, QR 48, JZT 43, VLZ 40, HJF 39, WPA 39, AQQ 38, CEE 31, HOE 16, ZU 15, ARD 12, BZB 9, BIH 5, BXP 5, WBC 5, DZB 4.

## CANADIAN DIVISION

**MARITIME —** SCM, Douglas C. Johnson, VE1OM — Asst. SCM: Fritz A. Webb, 1DEB, SEC: RR, RMs: VE1HJ and VO6X, PAMs: VE1OC, VO2AW, and VO6N, ECs: VE1AAV, VE1DG, VE1DW, VO2G, and VO6U. A new appointee is PF, PAM for N.B. We regret the passing of E.A. Clary was particularly noted for his 160-meter transatlantic pioneer work, and had set a number of DX records on that and other bands. The Cape Breton C.D. Net meets Sun. at 1:30 p.m. on 3750 kc. Congrats to AV and his XYL on the new jr. operator. A movie interview of FQ was shown on CBHT after Brit had informed the press that two missing Arctic travelers were found. BN is using new all-aluminum sky hook with 450-ohm feed. VO1M, M, U, V, and Y have migrated to 20 meters. VO1AB has a new mobile. VO1AE is active on all bands. VO1AM is back on after a few years layoff. VO3X and VO1D participated in the BERU Contest. W4BRP/VO2 has 5 watts on 3.5 Mc., and 500 on 14 Mc. Congrats to VO1AH and his XYL on the new jr. operator. VO6N is running 150 watts and has worked up to 77 countries. VO6AH is Acting NCS for the Labrador Net. The GBARC is conducting a training program in theory and code under the direction of VO6R. Traffic: VO6N 158, VE1FO 129, VO6B 106, VE1PX 51, VO6S 46, VE1HJ 35, VO6AF 34, VE1QM 33, VE1UT 29, VE1OM 28, VE1ME 20, VE1OC 15, VO1D 8, VE1DB 3, VE1AV 2.

# Everybody's Talking About Our GLOBE KING!

*A Globe King transmitter was used in the Amateur Radio Booth at the recent State Fair of Texas. How did it operate? Here's what Mr. Edward F. Aymond, Jr. Amateur Day Committee Chairman, has to say:*

## THE 500 WATT Completely Bandswitching GLOBE KING

Here's an advanced design, high power transmitter of 500 watts input on both CW and fone 100% modulated. Is completely bandswitching 10 thru 160M. bands. Consists of FR, Speech Modulator and Dual Power Supply Sections. Entire unit is specially screened for TVI. Pi Network output matches any antenna from 52-600 ohms. Has provisions for VFO and Single Sideband input. Forced air-cooled 4-250 tube, push-talk, special aluminum mesh screening of RF Section — just a few of the many fine features. Enclosed in grey hammertone cabinet, 31" x 21 3/4" x 15".

Edward F. Aymond, Jr.  
Dallas, Texas  
WSUHV

"... was operated on 14.228 mc for 16 days continuous from 10:00 a.m. till 10:00 p.m. Some 200 different amateurs used this transmitter and not once ... did we have any trouble whatsoever.

"... no interference either on the video or the sound as a result of the Globe King being operated in this close proximity (3 feet) to (two) television sets. During the operation at the Fair, 41 states were contacted, 5 of the Canadian Districts, Alaska, Hawaiian Islands, Canal Zone, Cuba, Nicaragua, Honduras, Peru, and Columbia. All operation was via phone.

"... we were more than pleased with this operation and wish this transmitter had belonged to one of us personally"

*and ...*

Dan Hoover (W9VEY) of Hillsboro, Illinois says, "It sure is a wonderful rig. GRM just melts and backs off to either side."

In the words of George H. Cooke (W2LOP) of 25 Cottler Ave., Springfield, N. J.: "... there is absolutely no interference on our own TV set ... Needless to say I'm very well satisfied with my purchase."

And from Don Smith, La Junta, Colorado: "I think you have topped the field ... I congratulate World Radio Labs for really turning out a FB rig!!! ... The modulation reports I get are 'The best sounding rig on the band OM what are you running?'"

# Quick QUIZ

Q. What are the procedures to be followed in renewing an amateur station and operator license?

Q. Who may operate an amateur radio station?

Q. What are the requirements for portable and mobile operation?

Q. How do U.S. amateurs obtain authorization to operate in Canada?

## The ANSWERS?

You'll find them all in . . .

Complete FCC and International Rules and Regulations governing amateur radio . . . detailed explanations on amateur licensing covered in separate chapters . . . a complete index for ready reference . . . and, of course, separate study guides for all amateur operator examinations. . .

*50 cents postpaid*

**THE AMERICAN  
RADIO RELAY LEAGUE**

West Hartford 7, Connecticut

**ONTARIO** — SCM, G. Eric Farquhar, VE3IA — We record with deep regret two Silent Keys, OW and AP. OW was well known as a member of the Air Transport Board and an active member of the Ottawa Amateur Radio Club. AP, a past secretary of the same club, and a member of the Dept. of Transport, was very active on 20, 40, and 80 meters. The Nortown Radio Club of Toronto is possessor of the Marconi Trophy for being top Canadian score in the 1954 ARRL Field Day operation. Up Simcoe way the Norfolk Club recently held a banquet, but lack of information has us guessing as to what took place. The annual banquet of the Brantford ARC was a tremendous success. Some eighty hams who attended, representing Windsor, Chatham, Cravenhurst, Elora, Toronto, Hamilton, Galt, Kitchener, and Belmont, heard some very interesting data on civil defense, ably presented by P. H. Fox, Chief Transport Officer for Canadian Civil Defense. He described civil defense as "a pressing necessity toward safeguarding the lives and well-being of our people and the preservation of that way of life which we hold so dearly and prize so deeply, within our hearts." 2BE, ARRL Canadian Division Director, who recently completed 25 years of service to Canadian Amateur Radio as its representative, outlined the benefits derived from being a League member. Touching on the AREC, which forms communication networks across Canada, he said, "These are the boys who control and operate the civil defense networks. All other organizations get their reservoir of trained personnel from this organization." TM changes receivers and says "There's a difference." BUR and his XYL were seen vacationing down Tampa way. VZ reports OSN activity keeps up. A newcomer in Belleville is BDT. VWI, in Kapuskasing, puts out a nice signal on 40 and 80 meters. BSW reports being the "first VE contact" to about 25 Novices. U.h.f. fellows are asked to be on the lookout on the 420-Mc. band for BDT, CAB, BEE, and ASD. Traffic: VE3GI 172, BUR 168, VZ 126, AJR 95, AUU 74, TM 62, DQX 38, BJV 35, CP 22, KM 22, NO 21, AVS 17, AOE 14, DPV 14, PH 10.

**QUEBEC** — SCM, Gordon A. Lynn, VE2GL — PQN is taking a beating these days from poor conditions, particularly long skip making short hauls difficult. However, DR continues behind it with quite a few stations reporting in. The same difficulty is being experienced on the Northland Net, as reported by FL. CA reports nothing new, just lots of traffic for the Far North. II has renewed ORS appointment after a lapse of a few years, this time from Sherbrooke. The St. Maurice Valley gang has one station or another covering 3675 kc. continuously throughout the day, as well as on 3740-ke. 'phone, on the lookout for traffic for that way. Reports from all parts of the VE2 district are solicited. Traffic: VE2CA 101, BB 82, LM 35, GL 16, CP 14, EC 14, ATQ 10, FL 10, LO 7.

**ALBERTA** — SCM, Sydney T. Jones, VE6MJ — PAM: OD, RM: XG. AL has n.f.m. and a.m. ready to go as soon as the OK has been received from the R.I. WC was away on a business trip to Houston, Tex. UB is active from the new QTH at Cowley. KL is building new remote control VFO. MJ is building a new antenna tuner. LQ has the new rig well under way. PS has a new TA12 rig. CE has plans for a vertical antenna. ZR has been hobnobbing with the Eskimos and working from VES-Land. Congratulations to WO and his XYL on the arrival of a YL jr. operator. CP stays up nights chasing the elusive DX. YE is active on the BC Net. Make plans now to attend the Alberta Hamfest which will be held this year in Lethbridge. It is with regret that the death of JJ is reported. A charter member of the Hat Ham Club, his advice and help were highly valued. Traffic: VE6HM 117, YE28, OD 27, AL25, WC7, IZ 5, MJ4.

**MANITOBA** — SCM, John Polmark, VE4HL — OO: RB. New officers of the ARLM are NW, pres.; MO, treas.; PE, secy. The Noon Net now is registered with the ARRL. EF is having trouble with his 20-meter beam. ML, IF, and JW are sporting new mobiles all with very nice signals. QD is having TVI trouble. JW has a new antenna but still has TVI. It is curling time so we don't see much of GB, XW, wouldn't it be better to stay on the ground? We don't have too many active YLs now. No reports were received from the 20-meter gang. A fine time was had by all at the ARLM's annual "Ham Do" Mar. 5th. The ARLM had a booth at the Sportsmen's Show and handled lots of traffic; a very nice showing for ham radio. Thanks to all relaying stations. Traffic: VE4GE 98, LO 18, EF 14, HL 14, KL 12, YR 11, QD 7, JM 6, AI 4, RB 4, AY 3, HS 2, OS 2.

**SASKATCHEWAN** — SCM, Harold R. Horn, VE5IIR — QL's activities are curtailed while changing the QTH to Govan. RE is looking after PAM duties in the meantime. LT finally made the air with 807s running 40 watts and puts out a nice signal. CM put in a busy week as communications station at civil defense, Fort Qu'Appelle. FG says his big traffic count is 1 delivered 1 received with a new addition to the family, a baby girl. Congratulations, Don. TV, at Swift Current, reports the formation of a club known as the Frontier City Radio Club with BC, pres.; TV, vice-pres.; and JR, secy.-treas. Meetings are held Fri. at 7:30 P.M. and any visiting ham is welcome. LU has changed his OBS frequencies to 3827 and 3798 kc. Tue. and Thurs. at 1830 hours. HN is a new ham at Nipawin and can be heard on 75- and 40-meter c.w. Traffic: VE5FG 31, HR 16, LU 12, VL 12, BF 10, DD 10, DS 10, CB 6, LJ 6, MX 6, CI 5, GX 4, LE 4, IL 2, RG 2, RE 1.

**BUSY? BUSY?  
LITTLE TIME FOR HAMMING?**

**GO MOBILE!**

**...AND MAKE GOOD QSO USE OF YOUR DRIVING HOURS!**

**HARRISON HAS IT!**

## MULTI-ELMAC EQUIPMENT

**to give you more fun per mile!**

AF-67

Has all the features that give you greater operating results!

● **VFO, and spotting switch!** Enables your zeroing-in to a net frequency, a CQ, or into a clear spot, without QRMing anyone. A "must" in the crowded bands.

● **Single knob bandswitch!** No matter the time nor location, you can quickly and easily jump to the band that will give you the solid local or DX QSO's you want. (Seven bands, 160 thru 10 meters.)

● **Power!** A respectable 40 to 50 watts OUTPUT, with good "sock" audio, keeps your signal right up there with the best of the KW's.

● **PLUS—**just about everything else you could desire in a modern, highly efficient, well constructed, compact (11½" wide x 7" high x 8½" deep), VFO transmitter for mobile, field, or fixed station stand-by or KW exciter.

AF-67, complete with tubes, quick-disconnect power plug, for 6/12 volt systems, and full installation and operating instructions. **\$177.00**

### THREE— for the price of ONE!

Slip the PMR-6A Receiver and the AF-67 Transmitter out of the car, and just by plugging in these AC operated power supplies you have a complete, compact, home and portable field station, or VFO exciter for any service or emergency.

PSR-116S

**Of course—**

Harrison has all of the good makes of Ham equipment!

Just order, or ask for literature and our low prices.

PS2V

115 Volt AC supply for complete operation of 6 or 12 volt model Receiver. With cable and plug.

PSR-116 —\$24.50

Same, out with S meter.

PSR-116S—\$35.50

Dual output supply for full power operation of the AF-67 Transmitter. Complete with cable and plug to match transmitter, and internal push-to-talk control. **\$56.25**

Coaxial antenna change-over relay with 115 Volt AC coil. **\$9.25**

Model S20VRX, 6 volt DC input. Brand new overstock, fully guaranteed. Regular net dealer price is \$80.25—it's yours for only **\$20.25** with the purchase of an AF-67.

Quantity limited—so, hurry!

### SAVE \$60

on this complete dynamotor supply, of top quality, with RF-AF filters, and control relay. Delivers 500 volts at 200 ma—just right for full power with the AF-67!

A complete 10 tube job, with internal noise limiter, BFO, RF stage, and everything else you would expect in a modern communications receiver—all in a cabinet only 6" wide, 4½" high, by 8½" deep!

(Specify 6 or 12 volt system) **PMR-6A \$134.50**

Speaker. Oval auto type, for mounting in dash. Heavy PM magnet, to handle the 3½ watts output of the receiver. **5" x 7"—\$3.95** **6" x 9"—\$4.50**

Multi-Elmac receiver power supply. Exceptionally well filtered and shielded. Mount anywhere—remote controlled by receiver. With cable and connector plug. Specify for 6 or 12 volt system. **\$24.50**

PSR-6

Round out your installation with these recommended top quality accessories:

Microphone. Shure controlled reluctance. Police type hand mike, with push-to-talk button. Dash mounting bracket. **\$17.35**

Antenna change-over relay. Coaxial type. With contacts for push-talk control, 6 or 12 volts DC. **\$10.50**

Webster "Band Spanner" Antenna. Telescopic tuning for 10 thru 75 meter bands. Stainless steel top whip. **\$29.50**

Premax antenna mount. Link chain type, clamps on to any bumper with 1" clearance. No holes to drill! **Type CA—\$5.88**

Heavy duty spring for CA—**\$6.47**

Master Mobile Deluxe "Any-angle" body mount. Heavy duty stainless steel spring. Coax connector. **132XXSSC—\$15.95**

Steel frame mounting racks. Fasten to bottom of dash, etc., unit is held in cushion grip, can be slid out for fixed station use.

For AF-67 or PMR-6A **\$6.95**

Mike plug **\$1.17**

RG-8/U coaxial cable.

The good kind! **Per foot 13c**

Coax connectors **SIX for \$4.50**

Heavy dynamotor cable **Per foot—18c**

**10%**  
lets you start having fun, now! Take a year to pay, on Harrison's low cost, confidential terms.

**TRADES?**  
Yes! Tops!

### SAFETY FIRST!

Keep both hands on the wheel, and your eyes on the road!

1. Use a Turner "Third Hand" to hold the mike in front of your lips. (\$2.94). Light-weight yoke slips around neck. Special Shure controlled reluctance hand microphone, quickly screws on or off "Third Hand" **\$8.82**

2. Put a "Foot-to-talk" switch in the floor-board, and connect across push-to-talk control wires. **\$1.89**

3. Mount the receiver where you can tune and see the dial without looking away from the road.

## Antenna Coupler

(Continued from page 13)

(Global) provides a convenient load for transmitter adjustments. Our requirements were for power inputs up to 250 watts with the transmitter terminated with 50 ohms; however, work is being done on a 70-ohm version of the "Z-match."

The transmitter used here has a pi-network output circuit and this is adjusted for proper plate loading with  $S_2$  in the first position, which connects the 50-ohm dummy load. Power can be read in the forward position of the bridge on the proper scale. No reflected power will be evident with the resistive load. The proper forward reading scale on  $M_1$  should be selected by means of  $S_1$ , depending on the power output of the transmitter. As can be seen from the schematic and photographs,  $R_2$ ,  $R_3$ , and  $R_4$  set the 0-10-, 0-100- and 0-1000-watt full-scale levels. Reflected power calibrations are automatically taken care of by the settings of  $R_2$ ,  $R_3$  and  $R_4$  when adjusted in the forward position.

It might be well to note here that transmitters having outputs in excess of 50 watts should be tuned up at lower power, because the dummy load in the "Z-match" is rated at 50 watts and excessive power could ruin the resistor. However, the "on-the-air" rating of the "Z-match" is much higher than 50 watts.

The antenna should be connected to the output terminals  $J_3$  or  $J_4$ , depending on the frequency.  $S_2$  is then switched to the second position and  $C_{10}$  and  $C_{11}$  tuned for minimum reflected power, as read on the meter. The two controls will interlock somewhat, but a few trials will readily lead to a good null. The system is then ready for use. In testing with a wide variety of both antennas and resistive loads, the reflected power was below one watt in all cases. After this minimum or zero reflected-power reading has been obtained no readjustment of the transmitter is necessary if it has previously been adjusted to work into the dummy load.

The tuning capacitor  $C_{11}$  will be near maximum capacitance for both 3.5- and 14-Mc. operation, while the setting will be near midscale at 21 Mc. On 7 and 28 Mc., the capacitance will be nearly at minimum. The setting of  $C_{10}$  will vary with different loads. In the third position of  $S_2$  straight-through operation can be used, enabling the amateur with a matched 50-ohm line to use the bridge. The bridge is an excellent instrument for adjusting element lengths on a beam for lowest reflected power.

(Continued on page 118)

As a service to visiting mobileers, the Amateur Radio Society of Eglin Air Force Base, Fort Walton, Fla., maintains a monitoring watch on 29,560 kc. Signs patterned after the ARRL diamond have been posted on main highways in the area to bring attention to the call-in frequency.

BOB CHEEK . . . WHO HAS BEEN A "HAM" FOR 23 YEARS AND OPERATES W3LOE . . . IS ASSISTANT MANAGER OF THE ENGINEERING DEPARTMENT AT THE WESTINGHOUSE ELECTRONICS DIVISION.

## WITH AN IMPORTANT MESSAGE FOR ALL ELECTRONIC ENGINEERS!

You may have heard Bob Cheek on the DX bands during the recent DX contest. Bob is a ham of 23 years standing, and is recognized as an outstanding DX operator, both phone and CW. Like many hams, Bob finds that his "rig" is relaxing and educational . . . and as stimulating as his work on advanced development projects at the Westinghouse Electronics Division.

Can a job be as interesting as a hobby? Bob says it can! "At Westinghouse," he contends, "the combination of professional surroundings, creative freedom and challenging 'projects of tomorrow' has put me in a real 'engineer's heaven'! In addition, the income and employee benefits, fine suburban living conditions, and so forth have helped both myself and my family achieve many of our

lifetime goals while we are still young enough to enjoy them!" For the expansion of work on the interesting projects mentioned by Bob Cheek, Westinghouse needs still more experienced electronics engineers. If you have an engineering degree and would like more information on top-level openings to be filled in the near future . . . drop us a line today! All replies will be treated with the strictest confidence!

# NEW!

# "28 Uses for JUNCTION TRANSISTORS"

only  
25¢

## Build your own TRANSISTOR DEVICES

- dynamic microphone • audio preamplifier
- five-watt audio amplifier • multivibrator
- 100 KC oscillator • DC voltmeter
- field strength meter

You'll find complete instructions for these and many other equally useful transistorized devices in Sylvania's new booklet.

This new booklet is a must for anyone interested in getting a firsthand practical understanding of the transistor. Each of the circuits has been designed by Sylvania engineers, built around Sylvania transistors and tested in Sylvania Laboratories to give you a compilation of practical transistor data. Circuit descriptions are preceded by a full, referenced chapter on Transistor Theory.

Pick up your copy at your Sylvania Distributor—or send 25¢ in coin with this coupon.

## Results

The "Z-match" has been in use at the writer's station for the past several months and the results have been excellent on all bands from 3.5 to 30 Mc. Two transmitters have been used. One is a Harvey-Wells T-90 Bandmaster running between 75 and 90 watts input on both c.w. and 'phone. The second, with a pair of 4-65As in the final running inputs up to 300 watts, has been used with no apparent breakdown of capacitors, coils or the Z bridge. The first transmitter utilizes a pi-network output tank, and after tuning this properly on any band into the 50-ohm load, no retuning is necessary after the "Z-match" is tuned for minimum reflected power. The second transmitter uses an all-band tank with series-tuned link output and the results were the same with this output circuit. The fact that retuning the transmitter is not required after tuning the coupler for zero reflected power indicates a definite impedance match.

Although the functions of the "Z-match" have been described in terms of matching the transmission line to a coax line to the transmitter, it is equally useful for coupling the line to a receiver. The same antenna is used for both transmitting and receiving at the writer's station, and received signals have been given a tremendous boost by the use of this coupler, mainly because the receiver has a nominal input impedance of 50 ohms and its antenna terminals are finally looking at the proper impedance. The send-receive switching is of course done in the coax link.

After operating conventional-type antenna couplers with no visual means of obtaining a match, we wonder how many times a mismatch has been tolerated. Quite often, we think, at this station, because the percentage of contacts for stations called has gone up tremendously since the installation of the "Z-match," and in the recent DX contest the speed of tuning helped in running up the best score we ever had, on both 'phone and c.w.

## Mobile Antenna Tuning

(Continued from page 18)

completed unit is ready for testing and adjustment. With all turns of the variable series antenna inductor removed (tap at top of  $L_1$  in Fig. 4), the externally-mounted loading coil (center or base) should be adjusted for resonance at the extreme high end of the band in use. This adjustment will place the transmitter and the antenna system on precisely the same frequency. Temporarily disconnect the tuning motor from the control unit. Adjust balance control  $R_1$  to its electrical center position, and adjust the sensitivity control to the point where both relays  $K_1$  and  $K_2$  (Fig. 3) are operated, as evidenced by illumination of both indicator lamps,  $I_1$  and  $I_2$ . Then slowly back off the sensitivity control until either one or both relays deenergize. If both relays

**YOURS FOR ONLY \$89.50**

20 WATT POWER AMPLIFIER

MEGAPHONE-Dynamic MICROPHONE Pistol GRIP-TYPE

**All Units BRAND NEW and GUARANTEED**  
**BATTERY CHARGING RACK Included**

Lafayette made a terrific deal with the U. S. Navy—bought a quantity of U. S. Navy Model PAE-2 Portable Amplified Electronic Megaphone Systems which enables us to offer the complete system at a price which can never be duplicated again.

Here is an ideal system for such applications as fishing boats, yachts, traffic control, sports events, construction crews, surveyors, carnivals, car owners, life-saving stations, or any place where handling of large crowds is necessary, and wherever convenient power line connections are not available, because unit operates from self-contained rechargeable 6-volt storage battery. Can also be used as a stationary or permanent system when used with charging rack, which is designed to hold entire portable amplifier and battery.

System consists of portable amplified electronic megaphone—operated by a trigger switch in the pistol-grip-handle—dynamic type microphone unit rated at 50 ohms at 1000 cps, and a reproducing unit, all contained in megaphone mouthpiece and housing.

A powerful 20 watt 6 tube amplifier, housed in a water-proof, two-piece, portable metal case (as illustrated), having compartment for and supplied with 3-cell 6-volt storage battery. Amplifier built with finest quality parts to rigid Navy specifications.

**A UNIVERSAL BATTERY CHARGING RACK** that operates from 110 volts AC 50-60 cycles, 110 volts DC, 12 volts DC, 24 volts DC, 48 volts DC, or 96 volts DC. The charging rack consists of a battery recharger with time switch and also provides a space for stowing the portable amplifier. Two pilot lights in the front panel of rack indicate a "Low" or "High" charging rate. Timing switch controls the rate of charging. Has separate On/Off switch.

Approximate Dimensions & Weight : Megaphone 20" long, diameter 13½".

Amplifier dimensions—in 2-piece Portable Metal Case, housing 6 volt storage battery—13¾" H, 12¾" W, 9¾" deep.

Charging Rack 15½" H, 13" W, 12" deep.

**COMPLETE SHIPPING WEIGHT 88 LBS.**

Complete System consisting of electronic megaphone, 20 watt portable amplifier with tubes and storage battery in case, as illustrated, Universal Battery Charging Rack with all necessary interconnecting cables and plugs and 30 page Instruction Book with schematic diagrams of all units.

drop out at the same positioning of the sensitivity control, no balance adjustment is necessary. If one relay drops out before the other, the balance control should be adjusted for simultaneous operation of  $K_1$  and  $K_2$ . Following adjustment of the balance control, the sensitivity control may be adjusted for optimum sensitivity. This system may be made sufficiently sensitive to respond to carrier shift brought about by nonlinear modulation and slight overmodulation excursions and to antenna detuning caused by passing pedestrians, automobiles or any phenomena causing even the slightest antenna detuning effect. Normal sensitivity adjustment is a matter of choice and will vary with individual operating requirements.  $R_3$  should not be adjusted to the point where  $K_1$  and  $K_2$  are energized simultaneously. Such an adjustment renders the tuning motor inoperative.

Sensing of this system may be changed by reversal of the output and input coaxial connectors. Reversal of the tuning-unit operation may be obtained by reversal of the two control leads from the remote control unit. In normal operation, series inductance is automatically added with a capacitive antenna and inductance reduced with an inductive load.

A great deal of satisfaction in mobile operating has been brought about by the use of this system. It is a real pleasure to QSY about the 40- and 75-meter bands without the worry of antenna resonance, and to be confident that no matter what the position of the mobile whip — *it is resonant.*

### Two-Tone Generator

(Continued from page 35)

#### Using the Two-Tone Generator

If the generator is used to test an s.s.b. exciter equipped with a high-impedance microphone input circuit, it will be desirable to divide down the output signal by means of a circuit such as shown in Fig. 4. If an input terminal or jack for audio

Fig. 4 — Method of connecting the two-tone generator to the microphone input terminals of a speech amplifier. The 33K resistors provide good isolation between the sources of the two output frequencies.  $C_1$  may be 0.01  $\mu$ f. for the usual high-impedance microphone input circuit.

input at higher levels is provided on the unit, the output of the generator need not be divided down. Since a few volts of d.c. exists from the output of the generator to ground, a blocking capacitor should be used if one is not employed in the equipment under test.

Two-tone test procedures have been outlined in references (2), (3) and (4). (See p. 124.)

(Continued on page 122)

# Looking for mobile gear?

...you'll do better on trade-ins and financing at Burghardt's!

**Terrific Trade-Ins**—As liberal as anyone in the country ...and yours may be worth more at Burghardt's. Trade-ins usually cover down payment on your new gear.

**10% Down—Easy Terms**—10% down lets you "take it away." Up to 18 months to pay on balances over \$200. Burghardt's financing saves you money—adjusts terms to your budget. All time payments on 1/2 of 1% per month based on original unpaid balance. Full payment within 90 days cancels interest.

**Speedy Delivery—Personal Attention**—No order too large or small for personal attention. All inquiries acknowledged and orders processed day received.

**MULTI-ELMAC AF-67 TRANSCITER**—Designed as an exciter—speech amplifier, VFO, driver, or a complete low powered transmitter. Covers 7 amateur bands: 10 through 160 meters. Single control band-switches all stages simultaneously—built-in VFO. Output circuit uses coaxial connector and a Universal Pi Matching network for wide variety of impedance matching. Provisions for 40 watts of audio at 500 ohms. Grid and plate circuits metered. Operates from 6 or 12 volt AC-DC source.

Complete with tubes and 15 prong power connector ..... **\$17.70**  
**\$9.64 per month for 18 months.** ONLY DOWN

**MODEL PS-2V POWER SUPPLY**—A universal power supply for use with the AF-67 or in many other applications. 6 V. @ 6 A. or 12 V. @ 3 A. Delivers 230 volts at 80 ma. DC output or 475 volts at 170 DC output. Separate plate and filament transformers. Fused primary circuit—Separate rectifier and filter circuits for each DC output. 11 1/4" x 7" x 8 1/2". Weight: 26 pounds.

**\$3.93 per month for 12 months.**

ONLY  
**\$4.95**  
 DOWN

**PMR 6-A RECEIVER**—A complete 10 tube, dual conversion, mobile communications receiver. Only 6 inches wide—covers 10, 15, 20, 40, 75, 80 and 160 meters as well as standard broadcast band. Built-in noise limiter is highly effective—built in BFO. Full 3 1/2 watts audio output with less than 1 micro-volt signal. AVC "on-off" switch located on front panel. Ten tuned circuits provide high selectivity.

**\$7.33 per month for 18 months.**

ONLY  
**\$13.45**  
 DOWN

**PSR-6 POWER SUPPLY**—Designed especially to power the PMR-6A receiver, 3 models: for 115 volt AC or 6 volt or 12 volt DC operation. Power turned on or off by switch on receiver volume control. Delivers 250 volts at 90 ma. B plus. Circuit is arranged to permit easy connection of an "S" meter. 6 and 12 volt units completely filtered to eliminate vibrator hash.

ONLY  
**\$24.50**

**Satisfaction Guaranteed**  
 or your money refunded  
 after 10 day trial.

## TOP TRADE-INS!

Write for our latest bulletin. We have hundreds of standard brand pieces of equipment in our trade-in department—used equipment made by Johnson, National, Collins, Hallicrafters, Ganset, Elmac, Harvey-Wells, Marrow, Central Electronics, and other leading names.

Our prices on trade-ins are realistic and down to earth. In addition where purchase is for cash with no trade-in, an additional 10% discount is allowed. Our own time payment plan tailored to your budget can be used for the purchase of used as well as new equipment.

**Improve the selectivity  
of your present receiver  
with this improved Q-Multiplier**

**R. L. DRAKE's Q-X'er**

**All the advantages  
of a crystal filter  
without the  
disadvantage of  
poor speech quality.**

Actual superimposed  
photos of HQ-129 pass-  
band with mechanical  
filter and DRAKE Q-X'er.

The R. L. Drake Model 583 is an improved Q-Multiplier which provides complete flexibility in use to provide either a sharply peaked IF curve or a deep rejection notch. Results are so superior that some communications set manufacturers are planning to substitute this type of unit for the usual crystal filter. And, with the R. L. Drake Q-X'er you can have these advantages with your present receiver.

#### Controls:

- **Selector Switch**
- **Notch Adjust Potentiometer** — Provides elimination of unwanted carrier and its heterodyne with no audible change in speech quality.
- **Peak Adjust Potentiometer** — True single signal reception for cw provides sharp peak and minimum passband.
- **Tuning** — with 8-to-1 vernier control of condenser, which allows tuning to any part of IF band.

#### Additional Features

- Closed core shielded Hi-Q coil not affected by nearby metal
- Peak and notch come at same point on tuning dial
- Uses a single 12AX7
- External connections: shielded lead to mixer plate or 1st IF grid, and 4-wire cable to 6.3 V at 300 mils and 100-250 volts at less than 1 ma.

**Q-X'er Model 583 for 455KC. \$24.95**  
**Amateur Net**

Other models for other IFs to be announced soon.

Available from your local distributor  
who handles R. L. Drake Filters

**R. L. DRAKE CO. MIAMISBURG, OHIO**

In the preceding paragraphs considerable emphasis has been placed on minimizing distortion. Low-distortion test signals are especially important when testing phasing types of transmitters because distortion on the test signal produces sideband components in the region of desired sideband suppression.

Another point which is worthy of consideration when evaluating the performance of the phasing-type exciter is the absolute phase shift in the 90-degree audio phasing network at the two test frequencies used. Reference (5), which discusses a typical phasing network, indicates a possible variation of about  $\pm 1.3$  degrees phase shift over a frequency range of 225 to 2750 c.p.s. For best results it is therefore desirable to select two test frequencies such as to produce equal phase shift; this results in equal suppression at each frequency and minimizes any slight ripple modulation which would otherwise be superimposed on the two-tone envelope output. Slight variation in components of one of the two oscillators may be made in this case so as to obtain a pair of frequencies fulfilling the above requirement.

The two-tone test generator is simple and inexpensive to construct and is believed to be a very worth-while addition to the test equipment used by the s.s.b. and a.m. man.

#### Keyer

(Continued from page 37)

released.  $V_{10}$  conducts and  $R_{28}R_{29}$  is negative. The dash selection potential is clamped by  $D_4R_{26}$ . The dot memory clears as the dot starts.  $V_{10}$  cuts off on  $-13$  volts from  $R_{30}R_{32}$ .  $R_{28}R_{29}$  rises to  $+12$  volts to pass the dash selection to  $V_{11}$ . Conduction in  $V_{11}$  establishes  $+10$  volts at  $R_{25}$  for a dash on the next positive time-base pulse, and drops  $R_{19}R_{20}$  to  $-7$  volts to lock out any new dot selection made before the dash starts. The reverse transfer actions are obtained through circuit symmetry.

With their interlocks and activation circuits,  $V_{10}$  and  $V_{11}$  comprise effectually a tri-stable system. Either one or the other tube may be conductive, but never both. However, both tubes may be nonconductive. The three conditions correspond to selection of dot, dash, and spacing characters. By itself, this structure guarantees that a given character will be held in storage if an opposite type character(s) has been priorly selected, and it will not be released until that prior character(s) has been transmitted.

$C_8$  and  $C_9$  delay the rise of sequencer cathode voltages. When control is transferred from one

# TRAVELING LIGHT

BUT WITH A COMPLETE

pocket-sized

LABORATORY

**ON HAND** for his service needs in the Triplett

Model 666R pocket size VOM

**TRAVELING LIGHT,** too, on expense

Model 666R is only \$26.50 net

Enclosed selector switch of molded construction keeps dirt out. Retains contact alignment permanently. A Triplett design representing the culmination of a quarter-century of switch making experience. Unit construction—All resistors, shunts, rectifier and batteries housed in a molded base integral with the switch. Eliminates chance for shorts. Direct connections. No cabling.

Precision film or wire-wound resistors, mounted in their own separate compartment—assures greater accuracy. Four connectors at top of case, controls, knobs and instrument are all flush mounted with the panel.

3" 0-200 Microammeter, RED • DOT Lifetime guaranteed. Red and black dial markings on white. Easy to read scale.

Precalibrated rectifier unit. Batteries—self-contained, snap-in types, easily replaced.

side to the other this delay guarantees that both memories are not cleared by the same clearance pulse and that both generating triggers are not tripped by the same time-base pulse. Without capacitive delay this would occur, since generator trip, memory clearance and sequence transfer are virtually simultaneous.

## Sequence Seizure

Thus far, a given sequencor tube cannot be activated by its associated memory or key until the opposite sequencor is released by both its key and memory, because of the interlock function.  $V_9$  and  $V_{12}$  generate seizure pulses to override the interlocks in such a manner that the output exactly follows the order of selection, regardless of subsequent key manipulations or holdings. The crisscross grid and cathode connection to the memories results in nonconduction in both tubes if both memories are clear or if both memories are actuated, and conduction in one of the tubes when the memory associated with its grid is actuated and the other memory is clear. This obtains from the following potentials in the memories: actuated—cathodes +11 volts, junctions  $R_{32}R_{33}$  and  $R_{40}R_{41}$  +1 volt; clear—cathodes +1.3 volts,  $R_{32}R_{33}$  and  $R_{40}R_{41}$  -17 volts. When both memories are actuated,  $R_{32}R_{33}$  and  $R_{40}R_{41}$  rise to +3 volts as the grid-current loading in  $V_9$  and  $V_{12}$  is removed.

Assume the dot and dash keys closed in that order before any output starts, with only the dot key held closed. Without seizure the closed dot key would hold the sequencor after the first dot on +10 volts from  $R_{37}R_{38}$  for continuous dot output, and the stored dash would not appear in the order of selection. However, when the dot memory clears, its cathode (and that of  $V_9$ ) drops to +1.3 volts and  $V_9$  conducts as a result of the +1 volt on its grid from the actuated dash memory.  $C_6$ , slowly reverse charged by  $R_{17}$ , charges through  $V_9$  and  $R_{18}$ . This momentarily reduces  $R_{19}R_{20}$  from +12 to -7 volts, to cut off  $V_{10}$  by pulling down the dot-holding potential at  $D_3R_{21}$ . Junction  $R_{23}R_{29}$  momentarily rises to +12 volts while  $V_{10}$  is cut off. The positive selection potential from the actuated dash memory seizes  $V_{11}$  via  $R_{26}$  while  $R_{23}R_{29}$  is positive, and conduction in  $V_{11}$  permanently holds  $R_{19}R_{20}$  at negative interlock potential to isolate the closed dot key. Thus sequence control has been transferred to the dash side despite the closed dot key, and the next output character will be the dash. When the dash memory clears, the still-closed dot key will reestablish  $V_{10}$  conduction for dot output. If both keys have been held closed, the dash hold potential will retain control of the sequencor, since the dot memory is now clear and no pulse will be generated by  $V_{12}C_{10}$  when the dash memory clears in the presence of an already-cleared dot memory.

Assume that the dash key is not closed until after the first dot (or any dot of a series) has started. The dot memory will be clear at this time with  $V_{10}$  conducting on the +10 volts from the closed dot key. The cathode of  $V_9$  stands at

## HAM GEAR AND SUPPLIES

... All Standard Radio, Audio, T. V. and Electronic Equipment!

NEW!

### Johnson Viking ADVENTURER CW Transmitter Kit

Work round the world with the ADVENTURER... the perfect transmitter kit for both novice and experienced amateur. Completely self-contained. Loaded with new features:

- Power Input — 50 Watts • Effectively TVI suppressed
- Pi-network output tuning — no antenna tuner needed
- Single-Knob Bandswitching on 80, 40, 20, 15, 11 and 10 meters
- Extremely compact in size — only 7 3/8" high x 10 3/8" wide x 8 1/8" deep.

No. 240-181-1 VIKING ADVENTURER Kit with tubes, less crystals and key. Complete with easy assembly directions and operating instructions.

### FOR THE HAM WHO BUILDS HIS OWN BEAM

Complete with all bolts, nuts, castings, insulators, mast-clamp, etc. No cutting—just telescope to length, drill and fasten.

Also Better Built Plytubular Beams for amateur—TV and other service.

See Your Distributor or Write

**TENNALAB • Quincy, Illinois**

+1.3 volts and that tube will conduct immediately when the dash memory is activated, seizing the sequencor as before.

In both cases, with both keys held closed, the subsequent output is a series of dashes until either the dash key is released or the dot key is released and reclosed. After clearance of the dash memory, release of the dash key applies -13 volts to the grid of  $V_{11}$  and initiates a simple sequencor transfer to the +10 volts from the closed dot key. Opening and reclosing the dot key with the dash key still closed actuates the dot memory for a  $V_{12}C_{10}$  seizure, and the output switches to dots. The opposites of these seizure actions obtain from symmetry.

### Summary of SMS Functions

1) Momentary closure of a key actuates the associated memory. The memory directs an activating potential toward the associated sequencor.

2) Continued closure of a key directs an independent holding voltage toward the associated sequencor. This hold potential is effective only after the associated memory has assumed or seized control of the sequencor.

3) Actuation of a memory with the opposite key and memory idle *assumes* control of the sequencor, isolating the opposite memory and hold potentials.

4) Actuation of a memory *seizes* control of the sequencor over continuously closed opposite key hold potential, if the opposite memory is clear.

5) Actuation of a memory does not take control of the sequencor over an actuated opposite memory.

6) Clearance of a memory whose key is closed allows an actuated opposite memory to seize control of the sequencor over the hold potential from that closed key.

7) Clearance of a memory whose associated key is closed does not relinquish control to an opposite closed key whose associated memory is not actuated.

8) In the absence of any actuated memories, release of one key after both keys have been held closed places the sequencor under control of the still-closed key.

### Summary of Actions of the Keys

1) A single character is generated by momentary or prolonged closure of a key. The character is held by the memory for a positive time-base pulse if the key is released prior to that pulse.

2) Successive like characters are generated by constant closure of a key.

3) When one memory is already actuated, closure of the opposite key before generation of the first-stored character activates the opposite memory. The firstly actuated memory retains control of the sequencor until one character of its type is delivered at the output. The secondly actuated memory then assumes control of the sequencor (as the first key is open or still closed) and the next output character is of the second type.

4) Continued closure of this second key maintains control of the sequencer after the transfer action, and the output is a series of the second type until that key is released. This obtains even with the first key still closed.

5) Release of the second key, with the first key still closed, causes the output to revert to the first character type.

6) Release and reclosure of the first key (just a flick!) reactuates the first memory and seizes control of the sequencer — the second key closed all the while — and the output reverts to the first character type until that first key is again released or until the opposite type character is flicked in by the second key. At least one character of the first type is guaranteed by the memory.

7) In recapitulation, any closure of a key guarantees at least one character of that type, transmitted in correct relationship to the order of closure, regardless of intervening selective motions. Whenever a key makes contact, the output subsequent to the character in progress corresponds to that key until the other key makes contact or the first key is released.

With automatic spacing, perfect characters, and memory and seizure leeways, all the operator has to do is spell. With a few more tubes, the keyer might be tied in to a dictionary.

#### **D.C. Output**

To eliminate the one relay, the circuit modification of Fig. 3 (Part I) can be applied. With this circuit,  $V_3$  conducts during spacing and its plate stands 120 volts negative with respect to ground. Cut-off voltage from  $-30$  to  $-120$  is available at the arm of  $R_2$ , for control of a vacuum-tube keyer.  $R_3$  protects the memory clearance junction  $R_1R_2$  from loading effects by connected equipment and also serves as the key-click filter resistance.

The plate of  $V_8$  drops 60 volts on marking, transmitting a 60-volt negative pulse via  $C_1$  to the grid of  $V_3$ . The  $C_1R_4$  time constant is sufficiently long to hold  $V_3$  cut off for a 2-w.p.m. dash. With  $V_3$  cut off the output load stands at ground potential, marking condition for the standard vacuum-tube keyer.

Heavy line surges can produce as much as 10 volts negative swing across  $R_4$ . The 24-volt positive grid return of  $V_3$  to  $R_5R_6$  ensures that these surges do not appear in the output. Since the generator and SMS trigger configurations are quite independent of source voltage, they are stable in the presence of any surge short of complete outage. Use of this output circuit demands that  $V_3V_4$  be at the absolute ground end of any heater strings. Even though the 12AU7 heater-cathode insulation is rated at 180 volts, the maximum point is approached in  $V_3$  when the line voltage exceeds 125.

(Scramble in Part I, April, 1955, *QST*: Page 14, left-hand column, in last paragraph, the text should read: "... insulated from the chassis by  $\frac{3}{8}$ -inch Plexiglas. Metal pivot blocks, tapped for 8-32, are bolted to the  $\frac{3}{4}$ -inch Plexiglas levers and threaded on the 8-32 pivot bolts. The pivot bolts are secured. . . .")

# HARVEY PRESENTS

## The NEW ELDICO VFO 10/20A

Variable Frequency Oscillator  
for 80 and 20-meter Bands

Designed expressly for Central Electronics SSB Exciters (Models 10A, 10B and 20A). Provides complete band coverage on 80 and 20 meters. No modification of Exciters is required.

Each band is accurately calibrated and divided into two sections selected by a front panel switch. Has 6-inch dial. Provides approximately 5 inches of bandspread on 75-meter phone band and 3 inches on 20-meter phone. Sturdy cabinet construction and rugged mounting of components achieve maximum mechanical stability. Electrical stability is attained through the use of circuit employing high-Q inductor and a precision geared tuning condenser. There are no tubes in the VFO proper, hence no heat to cause drift. A single tube (6BA6) oscillator unit plugs directly into an octal socket on C.E. Exciters. The only external connection is a single coax line from the exciter to the VFO.

Complete Kit with instruction manual..... **\$3995**

**E. E. or PHYSICS  
GRADUATES**  
*with experience in*  
**RADAR or**  
**ELECTRONICS**

*or those desiring  
to enter these areas...*

Hughes-equipped  
Convair F-102  
all-weather  
interceptor.

*The time was never more  
opportune than now for becoming  
associated with the field of  
advanced electronics. Because of  
military emphasis this is  
the most rapidly growing and  
promising sphere of  
endeavor for the young electrical  
engineer or physicist.*

Since 1948 Hughes Research and Development Laboratories have been engaged in an expanding program for design, development and manufacture of highly complex radar fire control systems for fighter and interceptor aircraft. This requires Hughes technical advisors in the field to serve companies and military agencies employing the equipment.

As one of these field engineers you will become familiar with the entire systems involved, including the most advanced electronic computers. With this advantage you will be ideally situated to broaden your experience and learning more quickly for future application to advanced electronics activity in either the military or the commercial field.

Positions are available in the continental United States for married and single men under 35 years of age. Overseas assignments are open to single men only.

SCIENTIFIC AND  
ENGINEERING STAFF

**HUGHES**  
**RESEARCH AND  
DEVELOPMENT  
LABORATORIES**

*Culver City,  
Los Angeles County,  
California*

Relocation of applicant must not cause  
disruption of an urgent military project.

USED IN ALL 48 STATES!

## Self Supporting STEEL TOWERS

For Rotary Beams, FM, TV

Amateurs and commercial users alike—in every one of the 48 states and many foreign countries—have discovered VESTO is the most famous name in towers! If you're not already a Vesto owner, write today for full information.

### ATTRACTIVE—NO GUY WIRES!

- 4-Post Construction for Greater Strength!
- Galvanized Steel—Will Last a Lifetime
- SAFE—Ladder to Top Platform
- COMPLETE—Ready to Assemble
- Easy to Erect or Move
- Withstands Heaviest Winds

Width of  
Base Equal  
to 1/5 Height

Vesto Towers are available in a wide range of sizes to meet requirements of amateurs and commercial users alike. Note the low prices for these quality lifetime towers: 22'-\$104, 28'-\$127, 33'-\$149, 39'-\$182, 44'-\$208, 50'-\$239, 61'-\$299, 100'-\$895.

## XMTRS FOR 160 TO 2 METERS

or Special Freq. 500 KC. to 160 MC.

### LETTINE MODEL 240 TRANSMITTER WITH MOBILE CONNECTIONS AND A.C. POWER SUPPLY

This outstanding transmitter has been acclaimed a great performer throughout the world. Air wound plug-in coils used for high efficiency. Takes any freq. from 1.6 to 30 mc. Ideal for General Class, Novice, CAP, CD, Industrial. Sold direct from our factory, ready to operate. 40 to 50 watts input, 1-Phone-CV. Complete with 8 x 14 x 8 cabinet, 40 meter coils, xtal, tubes: 6V6 osc., 807 final, 5U4G rect., 6XJ7 xtal mike amp., 6N7 phase inv., 2-6L6's PP mod. Wt. 30 lbs. \$79.95. 80, 20, 10 meter coils \$2.91 per band, 160 meter coils \$3.60. MODEL 130 FOR 120 TO 130 WATTS — \$199.50

MODEL 242 FOR 2 METERS — 45 WATTS INPUT — 6146 FINAL. Complete with mobile connections, A.C. power supply, tubes, xtal, xtal mike input. Uses 8 mc. xtals. Swinging link matches 52 — 300 ohm antennas. Same cab. as 240. \$89.95. Also 6 meter model.

150 WATT ANT. TUNER matches any antenna, 8 x 10 x 8 cab. \$20.00. Coils extra: 160 — \$4.30, 80 — \$3.45, 40 — \$2.73, 20 — \$2.40, 10 — \$2.31.

VFO FOR ANY OF ABOVE TRANSMITTERS — \$49.95  
Send full amount or \$25 with order — balance C.O.D.

# 8-TUBE SYLVANIA FM-AM CHASSIS

- ★ 7 UV. FM SENSITIVITY!
- ★ AC CIRCUIT SUPPLY!
- ★ OUTPUT TRANSFORMER!
- ★ PHONO INPUT SWITCH!
- ★ "FLAT" TONE CONTROL!
- ★ UNTUNED RF STAGE FM!
- ★ AM LOOP ANTENNA!
- ★ 8 NEW SYLVANIA TUBES!

★ EASILY CONVERTS TO TUNER, WE SHOW HOW!

**OVER \$31<sup>95</sup>**  
**50% OFF**

**Worth \$70**

EXCLUSIVE IN EASTERN U.S.A. AT RADIO SHACK, this brand new famous-make Sylvania chassis is the buy of '55 at a price less than a common garden variety ac/dc FM-AM radio! The straight AC circuit with transformer power supply allows conversion — if desired — to tuner with 71c-worth of parts (listed below) and our SIMPLE instructions which are INCLUDED with every set. To operate at once, attach ANY speaker having 3.2 ohm voice coil impedance.

SPECIFICATIONS INCLUDE: dual concentric controls; volume-power/tone, and FM-AM-Phono/Tuning. Tone control: flat center position and continuous from bass boost through treble drop — an important feature! Lab-checked excellent sensitivity of 7 microvolts for 30 db quieting — very fine figure.

Untuned RF stage on FM, shielded condenser gang, ratio detector circuit will operate with only a 4 ft. piece of hookup wire in local areas; provision for external antenna. Spare fuses AC receptacle on rear for phono motor. AC power transformer AND 3.2 ohm output transformer! AM loop. Includes instructions, schematic diagrams, conversion to tuner procedure for feeding external amplifier, lucite escutcheon which edge-lights by pilot lamp. IMPORTANT: circuit is AC — not AC-DC — and employs 8 tubes: two 6AU6, 6BE6, 6BA6, 6AL5, 6AT6, 6W6GT output, 7Z4 rectifier tube. Overall size: 10 1/4" wide, 5 1/2" high less escutcheon, 6 1/2" deep (8" with knobs). Ship. wt. 15 lbs.

★ NEEDS ONLY A SPEAKER  
TO USE IMMEDIATELY!

## PRICE LIST AND ACCESSORIES:

Order No.	Description	Wt.	Net

## Beginner's Receiver

(Continued from page 32)

choke lead. Four leads are brought out from the power supply to connect to the receiver: the two heater leads, the B+ lead, and the B- lead.

When the power supply is wired and the leads connected to the receiver, the unit is ready for testing.

### Testing and Using the Receiver

If you already have an antenna strung up, connect the end of it to Terminal 2—the one connected to the rotor of C<sub>1</sub>. If you don't have an antenna, any wire, 20 to 40 feet long or longer, can be strung up. An outside antenna will perform better than one indoors, although you'll hear plenty of signals with a wire just strung around the room.

Connect your headphones to the tip jacks and plug in the 80-meter coil. Plug the power cord into the 115-volt a.c. line and watch the 6US to see if the heater lights up. If it doesn't, turn off the power and check your wiring from the power supply to the heater pins, 4 and 5, on the 6US socket.

The receiver will only take a minute to warm up. Turn the regeneration control and, at one point, you should hear a change in the characteristic of the noise. This is the point where the receiver starts to oscillate. Tune the general-coverage condenser slowly and you should hear signals. Leave the capacitor set at or near one

(Continued on page 138)

# Take The Fuss Out of Switching Circuits

Now you can eliminate the fumbling and annoyance of screwing and unscrewing coax connections. With B&W's new Model 550 coaxial switch, you can instantly select antennas, transmitters, exciters, receivers, and other r-f generating devices merely by turning a knob.

This new multi-position coaxial switch has six S0239 connectors for selecting any one of five 52 or 75 ohm lines. It will handle up to 1 kw of modulated power with a maximum crosstalk of -45 db at 30 mc. Housed in a 2 3/4" diameter aluminum case, the unit is designed for single hole mounting.

## CASCADE CRYSTAL CONTROLLED CONVERTER for 144 or 220 Mc.

### Provides:

- **HIGH SENSITIVITY** — Sensitivity better than 1/10 microvolt. Gain approx. 30 db. Noise approx. 4 db.
- **COMPLETELY STABLE**. C.W. on 144 mc. NO mechanical modulation. Pure D.C. note. No drift.
- **RUGGEDLY BUILT** — Suitable for mobile application.
- **USE WITH ANY COMMUNICATIONS RECEIVER** — Availability with output at 1.1 F. frequencies 6-10 mc., 8-12 mc., 10-14 mc., 12-16 mc., 14-18 mc. We recommend use at 1.1 F. output 14-18 mc.
- **COMPLETELY SHIELDED** — In beautifully finished silver gray hammertone steel case.
- Available (SPECIAL ORDER) for other CD or industrial frequencies. Also available for Collins receiver.
- **USES 6BZ7, 2 — 6CB6, 2 — 6J6 tubes. COMPLETE** with plugs, tubes and crystal. . . . . \$42.50
- **Kit Form. Complete.** . . . . . \$29.75

Approved for G. I. training

### Parts List for Regenerative Receiver

- 2 100- $\mu$ f. midget variable capacitors (Millen 20100) ( $C_1, C_2$ )
- 1 15- $\mu$ f. midget variable capacitor (Millen 20015) ( $C_3$ )
- 1 100- $\mu$ f. mica or ceramic capacitor
- 3 0.001- $\mu$ f. disk ceramic capacitors
- 1 0.01- $\mu$ f. disk ceramic capacitor
- 1 0.01- $\mu$ f. 250-volt paper capacitor
- 1 10- $\mu$ f. 25-volt electrolytic capacitor
- 2 16- $\mu$ f. 250-volt electrolytic capacitors (or dual 16- $\mu$ f.)
- 1 470-ohm 1/2-watt carbon resistor
- 1 68,000-ohm 1-watt carbon resistor
- 1 0.1-megohm 1/2-watt carbon resistor
- 1 0.5-megohm 1/2-watt carbon resistor
- 1 1.0-megohm 1/2-watt carbon resistor
- 1 50,000-ohm potentiometer
- 2 1-mh. r.f. chokes (National R-50)
- 80-, 40-, and 20-meter Barker & Williamson Baby Inductors MEL ( $L_1, L_2$ )
- 1 interstage transformer (Stancor A-53-C) ( $L_3$ )
- 2 6-henry 40-ma. filter chokes (UTC R-55) ( $L_4, L_5$ )
- 1 power transformer, 120-volt secondary at 50 ma.; 6.3 volt at 1 amp. (Merit P3045 or P3046, or equivalent)
- 1 selenium rectifier, 130 volts, 20 ma. (Federal 1159) ( $CR_1$ )
- 1 aluminum chassis, 7"  $\times$  7"  $\times$  2"
- 1 aluminum panel, 7"  $\times$  6"
- 1 piece of aluminum for power-supply chassis, 3" by 10" (the panel and this piece are obtainable at any sheet-metal shop)
- 1 9-pin miniature tube socket, bakelite or mica filled
- 1 5-pin socket for coils  $L_1$  and  $L_2$ , bakelite or isolantite
- 4 3-terminal tie points
- 7 3/8" rubber grommets
- 1 Panel bearing assembly, over-all length 6"
- 1 insulated shaft coupler
- 1 terminal strip, 5 terminals
- 2 pin jacks, insulated type
- Miscellaneous 6-32 machine screws and nuts
- 6 ground lugs
- 25 feet of hook-up wire
- 4 knobs for controls (In the unit shown, a National type K dial was used for bandspread.)
- 1 6US tube
- 1 length of spaghetti wire covering
- Line cord and plug

of the signals and then tune the bandspread capacitor. This capacitor gives a slower tuning rate, making it much easier to tune in signals.

With a signal tuned in, rotate the antenna-trimmer control and the signal should get louder at one point. If it doesn't, change the antenna to terminal number 1 and short terminals 2 and 3 together with a short piece of wire. Try the antenna trimmer again, and you should find that the signal will peak up. The regeneration control setting may have to be changed to maintain oscillation.

Locating the amateur Novice bands is simple. Tune the receiver until you find an amateur 'phone station. The Novice band on both 80 and 40 meters is immediately below the 'phone bands. To tune lower in frequency than the 'phone bands, the bandspread capacitor is turned so that the capacitance increases, or the plates mesh.

The beginner will find great satisfaction in completing the receiver and many happy hours of listening will be his for the asking.

**"COMMANDER"** Power inputs up to 60 watts A.M. ....  
Continuous coverage from 160 .... including 6 meters

#### COMMANDER

.....an extremely compact and versatile transmitter, advanced in design, modern in circuitry. It covers a continuous frequency range from 1.7 to 54 mcs and may be operated xtal control as-is or with the Gonset VFO. A 6146 output tube and two 7C5's as modulators permit plate voltages of 400 to 500 volts—inputs, (modulated) to 50 watts. Two high Q coils provide

SIZE: 5 $\frac{3}{8}$ " high,  
 8 $\frac{1}{2}$ " wide,  
 7 $\frac{1}{8}$ " deep.

coverage of 75-40-20-15-11 and 10 meter amateur bands and are readily changed from front of housing. The output circuit eliminates loading problems frequently present with pi networks where the load is a short, loaded mobile antenna. Circuit also couples into balanced or unbalanced lines, can be quickly

converted to "Pi" or "L" networks by simple wiring change. Driver is bandswitched. The Commander uses any standard carbon or PA-type dynamic or crystal microphone. No preamp required.

An excellent VFO is available as a companion unit for the Commander. This is an extremely stable, low drift unit and uses no tubes—requires no operating voltage—coax cable, (furnished) plugs into fitting on Commander panel. Unit covers 75-40-20-15-11-10 meter amateur bands. Very rugged and compact—can mount next to transmitter or on steering column.

COMMANDER (with tubes) . . . Net 124.50

VFO . . . Net 29.95

# W2JXH awarded FIRST SSB W.A.C.

## using AEC's Model 410

Here is our AEC-410, 400 watt linear which provided W2JXH with the first SSB 'WAC' and top signals for many discriminating amateurs. To obtain POWER OUTPUT you must have POWER INPUT, which we provide with our rugged high voltage supplies. Only the finest components are used, and every precaution is taken to insure stability and linearity.

Tubes: Two 811A Push-Pull.

The low drive requirements of the 811A (in a push-pull plug-in swinging link type final) lend themselves admirably to use with the existing exciters of 3 to 10 watts output without additional driver stages.

Power supply: Self contained 1600 volts @ 325 mills, well filtered.

Grid Circuit: High efficiency band switching turret —well shielded, high Q.

Metering: Two large 3" square meters provide simultaneous and continual reading of grid and plate currents.

Size: Table top cabinet 22" W. x 14" H. x 14 3/4" D., with hinged top. Panel is std. 12 1/4" rack mounting. (Grey or black.)

Price: Complete all band \$295.00

## 400 WATTS

DC INPUT  
LINEAR  
AMPLIFIER

AEC-420: Band switching, pi-network parallel 811A's grid turret, otherwise similar to AEC-410 \$335.00.

AEC-1010 Kilowatt Linear with grid and screen supplies \$650.00 Complete with plate supply and cabinet \$875.00. For details of these or other A.E.C. SSB see them at your dealer or write or phone us.

(Continued from page 54)

meters. This is a problem for the Novices who are located near the Canadian border. Also, many Novices are not financially able to buy a super-selective receiver at the first chance. Each 'phone station takes up more room than a few c.w. stations. If the 'phone station is stronger than the c.w. station, it will blank it out. Furthermore, since Novices are crystal-controlled, they are not able to change frequency so readily when 'phone or other QRM appears.

— George Hippisley, KN2KIR

202 N. High St.

Mt. Vernon, N. Y.

Editor, QST:

I wish to take issue with the viewpoints taken by Messrs. Clark and Brogdon in March QST. Both of these letters seem to indicate signs of the so-called "progressive" viewpoint prevalent in amateur circles.

I agree with Mr. Clark in condemning the use of c.w. in the 'phone bands; it is definitely an ungentlemanly practice. But the reason is not that c.w. was here first. The same argument could be applied to argue that spark was here first so it should be allowed. As has been pointed out before, c.w. is necessary in case of communications emergency or breakdown of speech equipment, so it is necessary to have c.w. allowed everywhere (on the hambands that is). This does not give c.w. operators the right to use normally-assigned 'phone channels, the reason being courtesy to the 'phone men.

Mr. Brogdon carries his "progressive" ideas a bit too far. Granted that "sideband" is a more efficient form of communication. But how many, in spite of the technical niceties, are on s.s.b. compared to those on double-sideband? For that matter, a kilowatt is technically superior to 50 watts for reliability and readability of communication but are 50-watt rigs outlawed? The factor that makes for outlawing something should be the will of the majority of hams, not how closely some new system approaches perfection.

— Karl Felperin, W2FSJ

R. D. No. 2, So. Side  
Oncota, N. Y.

Editor, QST:

... I too came up through the Novice ranks; I too am disgusted with the shenanigans to be heard on the 75-meter 'phone band; but please, I say please, don't ask for five hundred kilocycles of unidentified carriers, sloppy splatter-band operators, etc. ... Admitted, there are always a few c.w. signals to be found in the 'phone bands, also admitted that there are quite a few lids running "kilowatts." Nothing has sounded as jolly as the character from Ohio heard for several evenings calling "CQ eighty" on the so-called wide-open c.w. portion of the band!

As you have assumed, I am primarily a c.w. man, part Scotch, yes, with a full 25 watts on 80 meters. I wouldn't be caught dead in your end of the band, because I don't have the patience or the experience to make me feel eligible to work a band which I always recall as the Happy-Hunting Grounds for the old-timers of this business.

— W. W. Thompson, W2MTA

## C.W.-BAND S.S.B.

2029 Hopkins Court  
Alameda, Calif.

Editor, QST:

After reading the pros and cons of a.m. 'phone vs. s.s.b. in the March issue from some of our (ugh) brothers, some of the heated arguments are rather nauseating.

I think both a.m. and s.s.b. definitely have their place in amateur communications if operated properly and I have heard some poor excuses for both. Some operators have the idea that s.s.b. operation eliminates the possibility of TVI, BCI, and even improper operation, but this to me is only an admission of ignorance. I have heard extremely wide signals complaining of the other, while operating close to each other.

The a.m. 'phone men complain naturally about s.s.b. and c.w. signals in the 'phone portions of bands, and I agree with them in many respects, but I think the fault lies with

the FCC in allocating such large portions of the bands to c.w. operation and small portions to the more useful means of communications, a.m. 'phone. If the c.w. and s.s.b. boys continually pat themselves on the back for operating on such small segments then maybe they would like to have less and be forced to operate in what the a.m. boys are using now.

It is my belief that if s.s.b. were forced to operate in separate portions of the band from a.m. they would have many more join them in true progress. The a.m. boys would leave the crowded 'phone segments to enjoy the merits of s.s.b. This may not lay too well on the s.s.b. boys' stomachs at first but think it over boys, it would be wonderful to operate s.s.b. in the c.w. bands. It is a nuisance to try to operate a.m. and have a s.s.b. close in frequency. Also, it must be tough for s.s.b. boys to be repeatedly referred to as "voice modulated key-clicks."

So it all boils down to this: we are not getting any place beating each other on the head, trying to convert a.m. to s.s.b., preaching lengthy sermons over the air, and committing the very act of libel and slander. The only reason for rivalry between s.s.b. and a.m. is because we are guilty as poor representatives and members of ARRL properly to govern ourselves and correctly allocate bands for proper operation. Instead of fighting each other we should exert all our force to allow s.s.b. to operate in the c.w. bands and let the a.m. boys have their segment in peace.

— Jack R. Perciful, W4PDC/6

## THEY CAME, TOO

119 Eustis Avenue  
Newport, R. I.

Editor, QST:

The second paragraph of your editorial in the March issue of QST might lead some to think that amateur affairs were handled by the Federal Radio Commission between 1927 and 1934. However, some of us who originally obtained our amateur and commercial tickets from the Radio Division of the Department of Commerce recall that it was not until July, 1932, that the responsibilities and duties of the old Radio Division were transferred to the FRC.

# POWER

## TRANSITRON "500" LINEAR AMPLIFIER

Power Output: Single Side-Band 400 watts  
peak envelope. C.W. 350 watts

Designed By Hams — To Serve Hams Better

HERE is an "honest to goodness" power-laden linear amplifier that comes right out of the design facilities of Transitron, Inc. So easy to operate, the Transitron 500 is a compact, fully shielded unit, ideally suited for single side-band operation.

IT HAS no plug-in coils, and features a minimum number of tuning adjustments. Field tests have proven the "500" to be of low harmonic output, free from parasites, and with excellent stability on all bands.

- Single Side-Band Operation
- Continuous tuning from 3.5 to 30 MC
- No Plug-In Coils
- Driving Power Required: 5 watts
- Low Harmonic Output

\$369.50  
net

### T-R SWITCH

### Model TR-1000

The most practical and efficient answer to operation of amateur and commercial transmitters and receivers from a common antenna. Requires no tuning adjustments of any kind and has a power handling capacity of 1000 watts.

\$9.95

# Q-max

## A-27

### LOW-LOSS LACQUER & CEMENT

- Q-Max provides a clear, practically loss-free covering, penetrates deeply to seal out moisture, imparts rigidity and promotes electrical stability. Does not appreciably alter the "Q" of R-F coils.
- Q-Max is easy to apply, dries quickly, adheres to practically all materials, has a wide temperature range and acts as a mild flux on tinned surfaces.

In 1, 5 and 55 gallon containers.

## In this top rated rig TVI is sealed in with METEX Electronic Weatherstrip

Viking Ranger

This inexpensive product will do the same for your own rigs. Follow the lead of Johnson and other high placed manufacturers.

For sealing your own rigs or any consumer, industrial or military equipment against RF leakage METEX Electronic Weatherstrip is highly effective and is a simple operation. It's made of highly resilient compressed knitted wire which comes in several forms to meet all normal requirements even where closure is of an uneven nature. Type TVI 20-S is easily applied to most rigs in the home workshop.

METEX Electronic Weatherstrip is the simplest and most inexpensive method for sealing in RF leakage yet devised. Try it. Results are amazing. Ham and industrial inquiries invited.

JOHN F. RIDER

Publisher, Inc.

380 Canal Street, New York 13, N. Y.

I also recall that originally the FRC was created by Congress in 1927 to bring order out of the chaos in the broadcast field. At that time its life was only going to be for one year, yet like many other Washington agencies that came along later, they imitated the "Man Who Came to Dinner" and picked up additional duties along the way. That is how they got amateur affairs in 1932. Then, in 1934, Congress straightened out the whole thing by creating the Federal Communications Commission.

It is refreshing to read an article that compares today's activities with earlier days.

— Lester C. Harlow, W4CVO/1

[EDITOR'S NOTE — OM Harlow is correct. The story appeared in Sept. 1932 QST.]

## ONE SOLUTION

Rt. 1, Box 825  
Tigard, Ore.

Editor, QST:

... True — there is a lot of QRM these days, but why not solve it nicely instead of trying to either change the rules or shove other amateurs around. Since one of the prides of being an American amateur is to be flexible and help with many new "firsts" in radio, wouldn't the best solution be to improve your own operating techniques first and then try to help the other fellow instead of drowning him out.

Many hams in this area have taken their rigs "upstairs" and are finding a new world in v.h.f.; c.w. for me on 80 and 40, and 'phone on 2 — and you can't ask for better ham radio when you practice good operating principles.

— Jim Strickland, W7SEZ

## YL News & Views

(Continued from page 55)

and OM W4HJH. . . . W5SYL, Iva, was one of some 100 YLs and OMs who assisted in the search for the body of W5DM, pilot of a plane which crashed in Texas. . . . And in Lancaster, Calif., K6HVB, Vivian, stayed on the air for more than 20 hours monitoring, relaying, and keeping 3995 kc. clear during a search for a Douglas jet test pilot on

(Continued on page 150)

Devotees of amateur radio come younger all the time. Here's one chap who was exposed to 75-meter QRM at the innocent age of several hours.

For five days following the birth of son Mark Eric in January, Mildred Drummond, W0GNG, kept three schedules daily with OM W0BWP, Rev. Wesley J. Drummond, pastor of the Second Presbyterian Church, Flandreau, S. Dak. Mildred's transmitted instructions on household matters were dutifully carried out at home by her OM, 11-year-old son John, WN0TLR, and 9-year-old daughter, Darlene.

We note with womanly interest that it is becoming fairly common practice for mothers-to-be to pack a portable transmitter and receiver with a suitcase to take to the hospital for a maternity confinement. Seems opportune for a few days of leisurely(?) QSOing.

# NOW! SSB

## at a new low cost\*

4" long x 1-3/8" wide, 2-3/16" high

with the **BURNELL S-15000 single side band filter**

Modest budgets no longer stand in the way of single side band advantages. Not with the new BURNELL S-15000 filter. This low cost filter can be adapted to commercial or ham receivers or transmitters!

Although the S-15000 is made with the same commercial quality toroids and condensers as employed in the regular BURNELL Commercial Grade Audio Filters,

it is designed for low budget application.

Also available: a new low cost upper single side band filter, S-16000.

Write Dept. P for our new booklet "Low Cost Single Side Band for Amateur and Commercial Equipment" and order your SSB FILTER now.

\*PRICE \$35.00 Net, plus postage

## PLUGS AND JACKS

Perfect for plug-in tuning units, inductors, or terminal strips, Johnson banana plugs and jacks permit fast assembly and disassembly, and provide positive, heavy current connection. Plugs have nickel-silver springs—extra long studs for added strength and rigidity. Both plugs and jacks are made of high grade nickel-plated brass with accurate threads and milled nuts.

Plug shown above has rugged, molded nylon insulating sleeves and is designed for solderless connection. For information on these and other Johnson plug and jack types, write for your free copy of General Products Catalog 976.

**GARDINER & COMPANY**

STRATFORD

NEW JERSEY

Take a teen-ager and her mother, both licensed amateurs, and you can virtually see the mutual pride that exists between them. Add a teen-age brother and a father with tickets, and you have a situation that any therapist would recommend for family happiness. In the case of the Hansen family of Cheney, Wash., mother Rosella, W7ULK, interested in radio for twenty years, got her license first, built a transmitter and started teaching her family. Daughter, son, and husband followed with the calls W7N7s VWU, VWZ, and WVA respectively. An ex-schoolteacher, Rosella has been coaching a number of teen-agers who aspire to become hams. She recently worked her daughter for her 100th QSL and a YL Century Certificate.

Jan. 13th. Twenty-seven amateurs and 11 mobile units helped locate the pilot within 48 hours. . . . K6DEN, Evelyn, is on 20 and 75 'phone regularly from Redwood City. . . . At a March meeting, committee chairman for the first YLRL International Convention gave various progress reports. It was announced that a fashion show would be staged during the luncheon on June 25th. . . . We regretfully note the untimely passing of Neva Josephine Fredenburg, W6YXI, and her husband John, W6VJQ. The couple perished when their automobile collided with another near Alpine, Calif. A charter member of the San Diego YLRL unit, Neva was past-president, vice-president, and secretary. Owners of a radio and TV store in San Diego, Neva and John were particularly active in AREC and c.d. activities. They will be missed by their many friends.

## How's DX?

(Continued from page 67)

by Statesider W3ZXD . . . . W6ZOL could use a tip on ex-KS4AQ's present whereabouts . . . . A belated bow to W2GTU for the idea behind last month's Jeevesie cartoon . . . . In very few months the FG7XB ten-watter with two crystals made contact with over 200 stations in 33 ARRL DXCC List countries. There is *nothing* like a call! . . . . Club North American notes, WFGDXC: W6AIW, W6EIB and YN4CB have been straining at the leash to put YNØYN on the air from Corn Island. KS4 and HKØ operation is a possibility on this jaunt, too. Meanwhile, KS4AW hopes to keep Swan Island available for another month or so. NCDXC: VP7NX (W6RRG) subsequently may be heard as VP2NX, VP2RG and HJ6NX . . . . SCDXC outfitted itself with four nifty trophies to be awarded to high club scorers in the '55 ARRL DX Test, plus another rotating plaque award to be held by southern California's top all-around DX performer each year . . . . Sparked by the news-gathering of W4KVX, Ohio Valley Amateur Radio Association's *Ether Waves* burgeons into quite a juicy DX newsletter. . . . W9FGX does DX-editing chores for *Sparks*, organ of the Tri-State Amateur Radio Society with headquarters in Evansville, Indiana.

### DXCC NOTES

Announcement is hereby made of the addition to the ARRL Postwar Countries List of two new countries. For purposes of identification these will appear on the list as Saint Martin and Sint Maarten. Saint Martin will encompass all French territory within the limits of 17 and 19 degrees north latitude and 62 and 64 degrees west longitude. Sint Maarten shall serve to designate Netherlands territory within these same boundaries.

DXCC credit will be given starting July 1, 1955, for creditable confirmations dated on or after November 15, 1945. This will permit foreign amateurs to start receiving credits at the same time as those in U. S. A. Confirmations received prior to July 1, 1955, for these countries will be returned without credit.

In future ARRL DX Competitions, those making contact with amateur stations located in either Saint Martin or Sint Maarten may claim credit for a separate country in accordance with DXCC rules.

# FACTS ABOUT LEARNING

# CODE

*Now* — A PROFESSIONAL TELEPLEX IN  
THE NOVICE PRICE RANGE

**S**ENDS correctly timed signals from 5 words to 70 words per minute. Sixteen lessons. Its 110 volt A.C. motor makes it hold an even, steady speed. Code is received on the air over headphones; therefore, it should be learned with oscillator and headphones. Furthermore, an oscillator is an excellent device with which to learn sending.

**Y**OU get **TELEPLEX TWO PHASE, STEP BY STEP** instruction. That means first you train your EAR to HEAR the signals in the same manner you hear spoken words. You learn only a few letters at a time. You advance step by step in an orderly manner. You may select for concentrated practice characters that give you trouble. You are never confused by jumping from one character to another without sufficient time to thoroughly learn the sound.

You get plenty of cipher groups that you will never memorize. Speed up to 25 words is child's play with TELEPLEX. Forty to fifty words certainly is within reason.

Send postcard for brochure describing **MASTER TELEPLEX**, the only Code Teacher that records your own signals so that you can see and hear just how you make your signals. (See it at **Blan's**, 64 Dey St., New York.)

**NOVICE SPECIAL** with 16 Lessons \$15.95 prepaid. Built-in oscillator with radio tube \$6.00 extra. Complete oscillator kit with tube; you wire it up \$4.00 (Oscillator or kit not sold separately.) Get it from your dealer or order direct. State your present code speed if any.

**Here's Why!**

There's no drilling or damage to Bumper or splash-pan necessary. "CA" Bumper Mounting is fully adjustable with 9 links of chain. Add or remove links as needed!

# HAM-ADS

(1) Advertising shall pertain to radio and shall be of nature of interest to radio amateurs or experimenters in their pursuit of the art.

(2) No display of any character will be accepted, nor can any special typographical arrangement, such as all or part capital letters be used which would tend to make one advertisement stand out from the others. No Box Reply Service can be maintained in these columns.

(3) The Ham-Ad rate is 30¢ per word, except as noted in paragraph (6) below.

(4) Remittance in full must accompany copy. No cash or contract discount or agency commission will be allowed.

(5) Closing date for Ham-Ads is the 20th of the second month preceding publication date.

(6) A special rate of 7¢ per word will apply to advertising which, in our judgment, is obviously non-commercial in nature, and is placed and signed by a member of the American Radio Relay League. Thus, advertising of bona fide surplus equipment owned, used and for sale; by an individual or apparatus offered for exchange or advertising inquiring for special equipment, if by a member of the American Radio Relay League take the 7¢ rate. An attempt to deal in apparatus in quantity for profit, even if by an individual, is commercial and all advertising by him takes the 30¢ rate. Provisions of paragraphs (1), (2) and (5), apply to all advertising in this column regardless of which rate may apply. To expedite handling of your copy please state whether you are member of ARRL.

(7) Because error is more easily avoided, it is requested signature and address be printed plainly. Typewritten copy preferred, but handwritten signature must accompany all authorized insertions.

(8) No advertiser may use more than 100 words in any one issue nor more than one ad in one issue.

*Having made no investigation of the advertisers in the classified columns, the publishers of QST are unable to vouch for their integrity or for the grade or character of the products or services advertised.*

**QUARTZ**—Direct importers from Brazil of best quality pure quartz suitable for making piezo-electric crystals. Diamond Drill Carbon Co., 248 Madison Ave., New York City 16.

**MOTOROLA** used communication equipment bought and sold. WSBGO, Ralph Hicks, 204 E. Fairview, Tulsa, Okla.

## Test your QRK\*

THIS little quiz is based on articles appearing in *QST* for March. How much do you remember from the issue of two months ago?

1. What is the least noisy vacuum tube amplifier?
2. What benefit is gained by "fanning" elements of a beam antenna?
3. Multivibrators are usually used to divide the frequency of a crystal oscillator by a factor of not more than \_\_\_\_\_.
4. What adjustments at the transmitter will affect the s.w.r. in the transmission line?
5. What bill of interest to amateurs is pending in Congress?

How you scored doesn't matter too much. The important question for any active amateur is "What magazine covers the whole of amateur radio—regulatory matters, operating activities, and first class technical articles?" . . . and the answer is: *QST*. Is it delivered to your door every month?

## 90900 Series Cathode Ray Oscilloscopes

The No. 90902, No. 90903 and No. 90905 Rack Panel Oscilloscopes, for two, three and five inch tubes, respectively, are inexpensive basic units comprising power supply, brilliancy and centering controls, safety features, magnetic shielding, switches, etc. As a transmitter monitor, no additional equipment or accessories are required. The well-known trapezoidal monitoring patterns are secured by feeding modulated carrier voltage from a pickup loop directly to vertical plates of the cathode ray tube and audio modulating voltage to horizontal plates. By the addition of such units as sweeps, pulse generators, amplifiers, servo sweeps, etc., all of which can be conveniently and neatly constructed on companion rack panels, the original basic 'scope unit may be expanded to serve any conceivable industrial or laboratory application.

**Everything for the Amateur  
from one complete  
dependable source**

**ultra-modern facilities to serve you best**

*you can't log 'em  
if you can't hear 'em!*

No matter what else a receiver does, it must pull 'em in! And that's just what the NC-183D does! Compare its **1uv** sensitivity (on 6 meters) and extremely low noise level with the highest-priced amateur receivers made (\$150 higher!) and you'll see why you'll hear more, log more on an NC-183D!

**COVERAGE:** Continuous from 540 kcs. to 31 mcs. plus 48 to 56 mcs. for 6-meter reception.

**FEATURES:** Two tuned R.F. stages. 3 stages of I.F. Voltage regulated osc. and BFO. Main tuning dial covers range in five bands. Bandsread dial calibrated for amateur 80, 40, 20, 15, 11-10 and 6-meter bands. Bandsread usable over entire range. Six-position crystal filter. New-type noise limiter. High fidelity push-pull audio. Accessory socket for NFM adaptor or other unit, such as crystal calibrator.

**\$399.50**

#### PRECISION-WOUND RF CHOKES

National makes a complete line of quality RF chokes, covering virtually every frequency range and every electronic need. In addition, National's engineering staff and production facilities are capable of winding chokes to any specifications for commercial or military applications. Write for complete information.

# Leading Amateur Designs ... *USE RCA TUBES*

In the Heathkit DX-100, a single RCA-5763 beam power tube drives two RCA-6146 beam power types in parallel in the final—an ideal combination that is capable of delivering a "healthy" signal at a very modest cost.

Here's ONE basic reason—among many—why amateur and professional designers prefer RCA Tubes.

RCA High-Perveance tubes deliver high power output—at lower plate voltages. For you this means: (1) lower-voltage filter capacitors, (2) lower-voltage tank circuits, (3) more reasonable values of pi-network components, (4) fewer problems with rf and dc insulation.

RCA high-perveance power tubes—both beam and triode types—are available at your RCA Tube Distributor. For technical data, write RCA, Commercial Engineering, Section, E37M Harrison, N. J.

## NEW EDITION! RCA Headliners for Hams

Completely revised, up-to-date data on RCA Tubes for amateur transmitter applications. Free—from your Tube Distributor.

Popular beam power combination for medium power. RCA-5763 takes up to 17 watts input CW, 15 watts 'phone; RCA-6146 takes up to 90 watts input CW, 67.5 watts 'phone. Both types are original RCA designs!

Final Amplifier of the Heathkit DX-100, showing two RCA-6146's in parallel.

THE STANDARD OF COMPARISON FOR OVER 20 YEARS

# HIGH FIDELITY TRANSFORMERS

FROM STOCK... ITEMS BELOW AND 650 OTHERS IN OUR CATALOGUE B.

## TYPICAL UNITS

### LINEAR STANDARD series

Linear Standard units represent the acme from the standpoint of uniform frequency response, low wave form distortion, thorough shielding and dependability. LS units have a guaranteed response within 1db. from 20 to 20,000 cycles.

Hum balanced coil structures and multiple alloy shielding, where required, provide extremely low inductive pickup.

These are the finest high fidelity transformers in the world. 85 stock types from miliwatts to kilowatts.

**LS-10X Shielded Input**  
Multiple line (50, 200, 250, 500/600, etc.) to 50,000 ohms... multiple shielded.

**LS-19 Plate to Two Grids**  
Primary 15,000 ohms.  
Secondary 95,000 ohms C.T.

**LS-50 Plate to Line**  
15,000 ohms to multiple line... +15 db. level.

**LS-63 P.P. Plates to Voice Coil**  
Primary 10,000 C.T. and 6,000 C.T. suited to Williamson, MLF, ul-linear circuits.  
Secondary 1.2, 2.5, 5, 7.5, 10, 15, 20, 30 ohms. 20 watts.

**CASE** LS-1 LS-2 LS-3  
Length 3 1/8" 4-7/16" 5-13/16"  
Width 2 5/8" 3 1/2" 5"  
Height 3 3/4" 4-3/16" 4-11/16"  
Unit Wt. 3 lbs. 7.5 lbs. 15 lbs.

### HIPERMALLOY series

This series provides virtually all the characteristics of the Linear Standard group in a more compact and lighter structure. The frequency response is within 1 db. from 30 to 20,000 cycles. Hipermalloy nickel iron cores and hum balanced core structures provide minimum distortion and low hum pickup. Input transformers, maximum level +10db. Circular terminal layout and top and bottom mounting.

**HA-100X Shielded Input**  
Multiple line to 60,000 ohm grid... tri-alloy shielding for low hum pickup.

**HA-106 Plate to Two Grids**  
15,000 ohms to 135,000 ohms in two sections... +12 db. level.

**HA-113 Plate to Line**  
15,000 ohms to multiple line... +12 db. level... 0 DC in primary.

**HA-133 Plate (DC) to Line**  
15,000 ohms to multiple line... +15 db. level... 8 Ma. DC in primary.

**CASE** H-1 H-2  
Length 2 1/4" 3-9/16"  
Width 1 1/8" 1-13/16"  
Height 1 1/4" 1 1/2"  
Unit Weight 2 lbs. 5 lbs.

### ULTRA COMPACT series

UTC Ultra Compact audio units are small and light in weight, ideally suited to remote amplifier and similar compact equipment. The frequency response is within 2 db. from 30 to 20,000 cycles. Hum balanced coil structure plus high conductivity die cast case provides good inductive shielding. Maximum operating level is +7db. Top and bottom mounting as well as circular terminal layout are used in this series as well as the ones described above.

**A-10 Line to Grid**  
Multiple line to 50,000 ohm grid.

**A-18 Plate to Two Grids**  
15,000 ohms to 80,000 ohms, primary and secondary both split.

**A-20 Mixing Transformer**  
Multiple line to multiple line for mixing mikes, lines, etc.

**A-26 P.P. Plates to Line**  
30,000 ohms plate to plate, to multiple line.

**A CASE**  
Length 1 1/2"  
Width 1 1/8"  
Height 2"  
Unit Weight 1/2 lb.

### OUNCER series

UTC Ouncer units are ideal for portable concealed service, and similar applications. These units are extremely compact... fully impregnated and sealed in a drawn housing. Most items provide frequency response within 1 db from 30 to 20,000 cycles. Maximum operating level 0 db. These units are also available in our stock P series which provide plug-in base. The O-16 is a new line to grid transformer using two heavy gauge hipermalloy shields for high hum shielding.

**O-1 Line to Grid**  
Primary 50, 200/250, 500/600 ohms to 50,000 ohm grid.

**O-6 Plate to Two Grids**  
15,000 ohms to 95,000 ohms C.T.

**O-9 Plate (DC) to Line**  
Primary 15,000 ohms, Secondary 50, 200/250, 500/600.

**O-14 50: 1 Line to Grid**  
Primary 200 ohms, Secondary .5 megohm. for mike or line to grid.

**OUNCER CASE**  
Diameter 7/8"  
Height 1-3/16"  
Unit Weight 1 oz.

UNITED TRANSFORMER CO

150 Varick Street, New York 13, N. Y. EXPORT DIVISION: 13 E. 40th St., New York 16, N. Y. CABLES: "ARLA"

• Right: the "why" of G-E "Operation Snow White". Unretouched micro-photograph of tube grid, shows a strand of lint which can easily cause an inter-electrode short-circuit. Dust particles have similar effect.

• Glass-paneled hoods for General Electric 5-Star Tube assembly and microscope inspection, assure working conditions of optimum cleanliness. Employees wear rubber finger cots,

to avoid contaminating tube parts with dirt or moisture. The entire "Snow White" area is air-conditioned and pressurized, and all garments are made of lint-free Nylon and Dacron.

## G-E "Operation Snow White" further increases 5-Star Tube high reliability!

Inoperatives among 5-Star Tubes have been cut two-thirds by measures G.E. has taken to provide lint-free, dust-free assembly and inspection. 100% 5-Star factory tests prove this gain in *built-in* tube dependability.

Most tube inoperatives are the result of intermittent "shorts" from lint and dust. G-E "Operation Snow White", by means of pressurized, filtered, and de-humidified air, plus numerous other steps to accent working cleanliness, cuts down on short-circuits at the source. Result: 5-Star Tubes are the most trust-

worthy types that you can install!

Use them in civil-defense work, where dependable communications are a "must"! Specially designed, built, and tested, they're your foremost protection against rig and receiver failures.

Your G-E tube distributor stocks 5-Star high-reliability tubes. See him for full information! *Tube Department, General Electric Co., Schenectady 5, N. Y.*

# SSB

**ease of operation  
exclusive with**

*Collins* **75A-4**

Advanced design features of Collins new 75A-4 receiver provide the greatest ease in SSB, AM, or CW operation ever offered to the amateur. Proven circuitry of the earlier 75A receivers such as crystal controlled first injection oscillator, hermetically sealed VFO and mechanically filtered IF selectivity are retained.

## PASSBAND TUNING

The receiver BFO is mechanically ganged and tracked with the main tuning dial. Once a SSSC signal is tuned in, it can be moved around in the passband to tune out interfering signals, and it also allows selection of either sideband for SSB operation. In CW reception the desired signal can be moved around in the passband without changing the received beat note, and at the same time, interfering signals can be pushed off the edge of the steep sided mechanically filtered passband.

## REJECTION TUNING

A combination "Q" multiplier and bridged-T rejection notch filter, are used. The filter has a deep, narrow notch and is effective anywhere in the passband. Conventional crystal filters become inoperative at frequencies several hundred cycles on either side of the resonant frequency. The "T" filter does not distort the IF passband seriously as does the crystal filter. Heterodynes are effectively eliminated with little loss of intelligibility.

Rejection Tuning Circuits

## AVC

A fast attack, slow release AVC system is employed in the 75A-4. It will respond to the first few cycles of a sideband transmission and does not require the presence of a carrier for operation. Fast and slow release times are selectable by means of a panel mounted control. The fast is used normally for AM reception. The slow is used during sideband and CW reception and prevents the receiver from opening up during words and characters.

## SEPARATE AM AND SSB DETECTORS

Separate detectors are used for double or single sideband signals. The single sideband detector is a mixer type, which generates much less distortion than a conventional diode detector on a SSSC signal. A diode detector is used for conventional double sideband signals.

AM and SSB Detector Circuits

The enemy attack will allow *no time* for the development of advanced communications systems . . . *no time* to further perfect electronic equipment for defense or swift retaliation . . . *no time* to produce more of the vital and dependable equipment made by Hallicrafters during World War II and Korea. Hallicrafters, with a background of over twenty years of electronic "know how," is perfecting and producing secret equipment *now* being used by our Air Force and other branches of the service. The American "edge" over the enemy depends upon Hallicrafters and other "Primary Producers" for the United States Armed Forces.

*World's leading exclusive manufacturers  
of communications radio*

## Section Communications Managers of the ARRL Communications Department

**Reports Invited.** All amateurs, especially League members, are invited to report station activities on the first of each month (for preceding month) direct to the SCM, the administrative ARRL official elected by members in each Section. Radio club reports are also desired by SCMs for inclusion in *QST*. **ARRL Field Organization station appointments** are available in the areas shown to qualified League members. These include ORS, OES, OPS, OO and OBS. SCMs also desire applications for SEC, EC, RM and PAM where vacancies exist. *All amateurs* in the United States and Canada are invited to join the Amateur Radio Emergency Corps (ask for Form 7).

# ABOUT SINGLE SIDE BAND THESE ARE THE FACTS

**"talk power" equivalent to 1 Kw. AM in the new Hallicrafters Linear Power Amplifier Model HT-31**

## • MORE COMPLETE • MORE RUGGED • MORE RELIABLE

**More complete**—Engineered with a wider range of antenna impedance—50 to 600 ohms.

**More rugged**—Components surpass even the most rigid commercial specifications. Heavier transformers for less heat, and an exclusive Hallicrafters feature, a blower to further reduce heat!

**More reliable**—on-the-air factory tests assure you of dependable performance. Here in one compact package is a full band switch power amplifier covering 80-40-20-15-11 & 10 meters that's easy to drive, highly stable, extremely versatile, and engineered to Hallicrafters world-famous quality.

### SPECIFICATIONS

Plate Power Input—500 - 510 watts.

Power Output—330 P.E.P. on 80 meters with slightly less on 10 meters.

Drive Power for 80 meter input 10 watts P.E.P. maximum on lowest frequency.

### FEATURES

1. Continuous frequency coverage from 3.4 Mc. to 30 Mc.
2. Pi-network output for efficient harmonic and T.V.I. suppression.
3. Major T.V.I. suppression built in.
4. Does not require an antenna tuner as will feed loads from 50 to 600 ohms.
5. Full power capabilities available on CW because high stable, time proven circuitry does not require trick overload protective devices.
6. No special selection of R.F. amplifier tubes required.
7. Total tube replacement cost including high voltage rectifiers, amateur net only \$14.20.
8. Full metering of all important circuits.
9. Power input in watts shown on meter.
10. May be mounted in relay rack.

### CIRCUIT DETAILS

This power amplifier employs two 811-A zero bias triodes in parallel. The input system is designed to be fed from a 50-70 ohm unbalanced line and requires a maximum of 10 watts drive on 80 meters. The grid tank circuit is balanced to provide all band neutralization. The output tank circuit is a continuously variable pi-network which provides a high degree of harmonic suppression.

### TUBES

# THE AMERICAN RADIO RELAY LEAGUE, INC.,

is a noncommercial association of radio amateurs, bonded for the promotion of interest in amateur radio communication and experimentation, for the relaying of messages by radio, for the advancement of the radio art and of the public welfare, for the representation of the radio amateur in legislative matters, and for the maintenance of fraternalism and a high standard of conduct.

It is an incorporated association without capital stock, chartered under the laws of Connecticut. Its affairs are governed by a Board of Directors, elected every two years by the general membership. The officers are elected or appointed by the Directors. The League is noncommercial and no one commercially engaged in the manufacture, sale or rental of radio apparatus is eligible to membership on its board.

"Of, by and for the amateur," it numbers within its ranks practically every worth-while amateur in the nation and has a history of glorious achievement as the standard-bearer in amateur affairs.

Inquiries regarding membership are solicited. A bona fide interest in amateur radio is the only essential qualification; ownership of a transmitting station and knowledge of the code are not prerequisite, although full voting membership is granted only to licensed amateurs.

All general correspondence should be addressed to the administrative headquarters at West Hartford, Connecticut.

# "It Seems to Us..."

## PUBLIC RELATIONS

The instances are fortunately rare, but every now and then an item in a newspaper will carry an account of amateur radio which can be classified as uncomplimentary. The subject is usually amateur interference. Occasionally the item is directly antagonistic; more often the disparagement is implied, or conveyed by an inaccurate headline.

In some of these few cases amateurs will write the League asking that a retraction be demanded. In our experience, this is entirely the wrong approach, for two reasons: Too much time is wasted (any effective action must be immediate); and generally speaking the editor is more impressed with a protest from his local readers than one from a distant organization. Usually, an alert local ham or club will take immediate action by contacting the paper or writing a letter to the editor in an attempt to obtain clarification and set the record straight. While this is the preferable procedure, it still has the disadvantage of again mentioning interference and amateurs in the same breath, and thus tends to accentuate the association of ideas.

There's a much better basic approach.

What is needed is full, complete and accurate accounts of all *other* amateur doings, so that any localized interference problems will seem minor in comparison to the good that can be and is being accomplished by public-spirited hams. In other words, a good long-range public relations program. To paraphrase the song title, you eliminate or neutralize the negative by accentuating the positive.

Naturally, any emergency activities of amateurs should be promptly and fully reported to the newspapers and radio stations. But in any one community emergencies are few and far between. You can't create a disaster, but you can be alert to participation in civic projects, or to initiation of some of your own, to maintain and improve the local standing of your amateur group. We'd like to mention here several such special projects, simply to suggest angles which you might use.

"Must" reading for those concerned with the state of our public relations is the article in November *QST*, describing Maryland Amateur Radio Week activities of the Baltimore Amateur Radio Club. It's full of project ideas.

A number of clubs have coöperated in fund-raising drives. One helped out in an all-night Telethon on behalf of the March of Dimes. Persons wishing to contribute called the TV station, whereupon an amateur net control installation directed a mobile to the address, where civic club members performed the leg-work of actually calling on the donors. Another amateur club undertook a similar project in a cerebral palsy drive, enriching it to the tune of \$50,000 — and doing themselves a world of good in public relations.

In a city famous for its huge parades, hams offered their services to the grand marshal. The marshal reluctantly accepted, and ended up immensely pleased — the parade started on schedule for the first time in the city's history! Needless to say, hams are now a fixture whenever they "strike up the band."

But you don't need to wait for fund drives or parades; except in the larger cities, a great many amateur occurrences are considered newsworthy. The local club receiving its charter of ARRL affiliation; a local amateur making DXCC; an emergency coördinator being appointed; participation by the club members in a contest, Field Day, or hamfest; delivery of a message from a serviceman in Alaska to his mother — all these and a host of other activities, however common they seem to us, can mean an inch or two in the Daily Bugle or 30 seconds on "The Voice of Podunk."

What else? Well, is your PTA putting on a hobby show? Be in it! Kiwanis looking for a speaker? Volunteer! Does your company have a "house organ"? Its editor would probably be delighted to have a feature story on the hams in the company.

Publicity helps are available at League Headquarters to make it easier for you, too. A sample speech, interview, radio broadcast program, and TVI script with slides are available. So are reprints of outstanding amateur stories, which have appeared in nationally-known magazines, to explain our hobby to interested BCLs.

Good public relations are important to nearly every society, corporation, or charity, but especially important to us — our very licenses depend on our activities being "in the public interest, convenience, or necessity." We must leave no doubt in the minds of the public that we meet this requirement.

## HAMFEST CALENDAR

**ILLINOIS** — The Central Illinois Radio Amateur Picnic will be held Sunday, July 17th, at Spider Woods State Park, six miles southeast of Decatur on State Route 121. Registration will open 11 A.M. CDT. There is no charge for admission to anyone interested in amateur radio. Lively contests for the kids; it will be a real family affair. There will be a ham auction and a swap table. Bring the family and a basket lunch. Drive east of Decatur on Highway U.S. 36 and watch for Ham Picnic signs.

**INDIANA** — The Annual Turkey Run V.H.F. Picnic will be held on Sunday, July 31st, at Turkey Run State Park under the sponsorship of the Wabash Valley Amateur Radio Association. The route in the park will be posted. There will be a swap table and games. Bring your family and a lunch basket and meet the v.h.f. gang. For further information write to Charles Hoffman, W9ZHL, Picnic Chairman, P. O. Box 186, North Terre Haute, Ind.

**MICHIGAN** — The annual Upper Peninsula Hamfest will be held on Sunday, July 31st, in the Houghton area, under the sponsorship of the Lake Superior Radio Club. The election of the UPEN NCS will take place at this time. Further details of the program will be given on local bulletins. There will be a potluck lunch, with coffee, pop, and ice cream provided by the host. A registration fee of one dollar will be collected at the grounds to cover expenses.

**MICHIGAN** — Sunday, July 31st, at Warren Dunes State Park, 15 miles south of St. Joseph, Michigan, on U. S. Hwy. 12 — Annual Picnic and Hamfest of the Blossomland Amateur Radio Association. Bring the family, a basket lunch, and swimming gear; also usable radio equipment for swap and shop. Ten-meter transmitter hunt. No admission charge to the park or picnic. Registration fee \$1.00 in advance or \$1.25 at the park. Please make reservation in advance through R. T. Hatch, W8JFW, 3225 Cleveland, St. Joseph, Michigan.

**MICHIGAN** — The first annual Adrian Amateur Radio Club Hamfest will be held Sunday, July 10th, at the Adrian, Mich., Fairgrounds. The program will consist of various contests of acquired skills, and will include activities of interest to XYs. The following bands will be monitored for mobiles: 2 meters at the low end; 10 meters at 29,640; 75 meters at 3910 and 3960; and 160 meters at both ends of the band. Gov. G. Mennen Williams of Michigan is expected to speak briefly. There will be a "swap and shop" party throughout the day. Representatives of leading manufacturers of electronic equipment of interest to amateurs will be present to discuss their products with the group.

**MONTANA** — The Glacier Waterton International Peace Park Hamfest will be held at Apgar Camp Grounds in Glacier Park on July 23rd and 24th. All welcome.

**WYOMING** — Saturday and Sunday, July 23rd-24th. The Annual Wyoming Hamfest at the South Fork Camp ground and Inn, in the beautiful Big Horn mountains 18 miles west of Buffalo, Wyoming. The Sheridan Radio Amateur League is sponsoring the event. A full program including banquet and Wyoming Trading Post is planned. Registrations, including banquet, \$3.50. Tourist mobiles in Yellowstone Park area welcome; watch for mobile antennas on Highway 16. Register with Robert B. Miller, President, 8RAL, 362 E. Loueks St., Sheridan, Wyoming, or contact any Wyoming ham for information.

### COMING A.R.R.L. CONVENTIONS

**July 30th-31st** — Canadian Division, St. John, New Brunswick  
**August 12th-14th** — Roanoke Division, Old Point, Va.  
**September 3rd-4th** — South Dakota State, Yankston, S. D.  
**October 15th-16th** — Central Division, South Bend, Ind.  
**October 22nd-23rd** — Midwest Division, Omaha, Neb.

## A.R.R.L. CANADIAN DIVISION CONVENTION

Saint John, N.B. — July 30th-31st

The New Brunswick Amateur Radio Association is sponsoring the 1955 ARRL Canadian Division Convention to be held in Saint John, N.B., on July 30th-31st, with the Loyalist City Amateur Radio Club as host. Every effort is being made to make this convention a most interesting, informative and enjoyable affair. It will be held in the YMCA building, commencing at 6 P.M. ADT, Saturday, July 30th. Registration is from 2 to 6 o'clock.

The program will include a banquet, special speakers, presentation of the VEI Contest cup, and contests. There will be a 75-meter hidden-transmitter hunt, picnic, games, etc., on Sunday, July 31st. Alternative plans are being arranged in case of poor weather on Sunday. There will be special programs for the ladies.

The rates, including banquet and picnic, are \$4.00 for men and \$3.00 for ladies. Send advance registrations to R. B. Nichols, VE1GE, 153 Rodney St., West Saint John, New Brunswick, Canada.

**25 Years Ago**  
this month

July 1930

... Describing the annual meeting of the ARRL Board of Directors, the Editor states that a lively advance interest was displayed by the members in regard to important topics scheduled for discussion. Comments were also made concerning various problems confronting 'phone men and measures the Board feels necessary to make voice operation more effective and enjoyable.

... Adventure and ham radio are combined in "Hamming with a Portable in Africa," by Clyde De Vinna, W6OJ-W6ZZK.

... "Naval Reserve Holds Its First National Emergency Drill," by William J. Lee, is a detailed report of that organization's latest operating activity. Main objectives of the drill were to determine speed, completeness of district representation, accuracy and circuit discipline.

... VE2CA, operated by Mr. and Mrs. Earle H. Turner, is the station of the month. With two transmitters, each employing UX-852 oscillators, the Turners emit healthy signals on both 7 and 14 Mc. Two receivers are in operation: one, a four-tube with an r.f. stage, detector, and two audio stages; the other, a conventional Hartley with a two-stage audio amplifier.

... RCA announces the production of three new tubes. One is a general-purpose tube known as the UX-230; another is a screen-grid tube, the UX-232; and the remaining is an UX-231 audio power amplifier featuring low distortion.

... Some good hints on key click elimination can be found in the Experimenters' Section of this month's issue. An excellent filter is described. It utilizes old Ford spark coil primaries and two 0.006-μf. capacitors.

... In the same section, A. E. Harrison, W6BMS, describes a receiver for 3.5 and 7 Mc. using a variometer for the tuning inductance. The set uses a Type '22 untuned r.f. stage, a Type '99 detector and two Type '01As as audio amplifiers.

### OUR COVER

"Oh! my aching back. . . I almost got that W7 . . . That #&%\* generator!" These are familiar post-Field Day expressions. Yes sir, if you weren't out with the gang this year you just haven't lived!

# A Four-Band S.S.B. VFO

*Single Fundamental Range for Use with Conversion-Type S.S.B. Exciters*

BY GORDON LAUDER,\* W9PVD

Most of the VFOs used in s.s.b. work with the Central Electronics exciters and others using a 9-Mc. master oscillator cover one, or at the most, two bands: 75 meters, or 75 and 20 meters. This is because the same 5-Mc. injection frequency can be used in the mixer stage for both these bands, but not for others. However, the injection frequencies for 40- and 160-meter operation are harmonically related to this same 5-Mc. injection frequency. The beautiful part of this is that the oscillator can always be calibrated against the 5-Mc. signal of WWV. Thus a VFO with a fundamental tuning range of 5.0 to 5.5 Mc., plus a bandswitched buffer/multiplier stage, will furnish outputs on all four bands.

Using two miniature tubes and slug-tuned coils, a complete unit can be built horizontally on a 3½-inch rack panel, as indicated by the accompanying photographs of the one used at W9PVD. The tuning is done with a National type MCN dial which has been equipped with a National type HRT knob for ease of tuning.

The circuit uses two 6AK6 tubes, one as an electron-coupled oscillator and the other as a buffer/multiplier stage. The plate coils of the buffer/multiplier stage are shorted out electrically, when not in use, by a Centralab switch that connects all unused contacts, thus connecting B-plus to both sides of unused coils. Shorting the coils allows mounting them in close proximity. All that is necessary is to wire B-plus voltage to any unused contact on the switch.

An 0B2 VR tube is used to stabilize plate and screen voltages of both tubes. Each stage uses 10 ma. of cathode current. The Central Electronics exciters furnish 300 volts at 25 ma. through the accessory socket in the rear. The

\*134 Marquette St., Park Forest, Ill.

• No doubt there would be more s.s.b. activity on 7 and 1.8 Mc. if it were not generally thought that a separate VFO is needed. Here's how to make one VFO unit serve for both the popular 4/14-Mc. combination and the above two bands as well.

0B2 dropping resistor is adjusted until a current of 23 ma. is drawn with the 6AK6s out of their sockets. This allows a margin of insurance against loss of ignition in the VR tube. At these current and voltage settings, sufficient VFO injection is developed to give stable operation on all four bands.

## Construction

The author's VFO was built on a homemade chassis. Room was reserved on the left side of the panel for mounting a 2-inch 'scope monitor, as described in the 1954 ARRL *Handbook*.

The best size in commercially available chassis would be the 5 × 10 × 3-inch with bottom plate. The dimensions of the chassis at W9PVD are 5 × 7 × 3 inches. The chassis is mounted with the top down and even with the bottom of the panel, to allow clearance for the bottom of the National MCN dial mechanism. The dial is mounted with the top flush with the top of the panel. The tuning condenser, C<sub>1</sub>, is mounted on an aluminum bracket so as to line up with the dial drive.

The switch S<sub>1</sub> is mounted on another bracket with the end of the 2-inch shaft projecting through a 3/8-inch hole in the panel to allow mounting the knob. This switch is mounted to be

The four-band s.s.b. VFO fits readily on a 3½-inch relay rack panel. By choosing the proper fundamental tuning range and using appropriate harmonics, four bands can be covered with exciters using a 9-Mc. s.s.b. generating frequency.

Oscillator circuit is at the right in this view, frequency-multiplying coils and handswitch at the left. The two resistors alongside the switch add up to the 10,000 ohms specified in Fig. 1 for the dropping resistor to the VR tube.

symmetrically placed with respect to the operation switch of the 10-A exciter, which is mounted directly above the VFO in the rack.

Viewed from the rear, the components mounted from right to left on the center line are  $L_1$ ,  $V_1$ ,  $L_2$ , and the plate coils for  $V_2$ , these coils being mounted in a roughly triangular grouping to give minimum lead length to  $S_1$ .  $L_5$  should be positioned for the shortest leads as it is the highest-frequency coil. After these come  $V_3$  and the jack,  $J_1$ . A 6-prong Jones chassis-type male connector was used for  $J_1$  because it was available in the junk box. However, any male connector having 5 or more prongs will do the job.

The two stages are shielded to reduce the possibility of feed-back when the buffer/multiplier is operated at the oscillator frequency. The coupling capacitor,  $C_6$ , is mounted inside a  $\frac{1}{4}$ -inch rubber grommet, both for mechanical stability and insulation.

Only two of the coils,  $L_1$  and  $L_5$ , need to be wound by the constructor. The total number of turns for  $L_1$  was wound on the XR-50 coil form, then  $5\frac{1}{2}$  turns were backed off before cutting and soldering to the ground end. The enamel is carefully scraped off with a knife, and the tap is made by wrapping the bared wire around a small diameter nail and then twisting once to

(Continued on page 116)

$L_3$  — Slug-tuned (CTC LS-3 10-Mc. coil).

$L_5$  — 25 turns No. 26 enam. on  $\frac{3}{8}$ -inch. diam. slug-tuned form (CTC LS-3).

NOTE: See text for data on resonating slug-tuned coils to proper frequencies. Inductance required depends on stray circuit capacitance and length of coax cable to s.s.b. exciter.

$S_1$  — Rotary switch, 1 pole, 3 positions, unused contacts shorted (Centralab PA-18 with PA-300 index. Use all spacers furnished to mount section near rear of index).

NOTE: The 2.5-mh. choke in the oscillator cathode circuit should be of the small type such as National R-33.

# Versatilize Your Oscilloscope

## Adding a Z-Axis Amplifier and Voltage Calibrator

BY LYLE E. SHARPE,\* W6FSC

THE addition of a Z-axis amplifier and voltage calibrator to any 'scope provides a useful asset and is not a difficult job. The oscilloscope pictured in this article is a Heathkit model 0-7, but the same technique may be applied to

Front-panel view of the 'scope with the additional controls.

\*% Engineering Dept., J. B. Rea Co., Santa Monica, Calif.

• This article describes the circuitry and construction involved in adding a Z-axis amplifier and voltage calibrator to any oscilloscope lacking these refinements. The Z-axis amplifier may be used for trace brightening, Z-axis modulation, or retrace blanking and, with the voltage calibrator, the measurement of any waveshape on the screen is available at the flick of a switch.

any 'scope, providing necessary space for mounting the parts can be found. In this case, very little space was available immediately behind the front panel, so two small subchassis were fabricated and set back on the main chassis with extension shafts run through panel bushings for the control knobs. As shown in the front-view photograph, the added rows of controls are placed midway between the existing controls with the voltage calibrator on the left side, and the Z-axis amplifier on the right.

### Voltage Calibrator

The voltage calibrator (Fig. 1) consists of a free-running symmetrical multivibrator ( $V_1$ ) operating at approximately 1500 c.p.s. Its output is taken off the plate of  $V_{1B}$  through  $C_1$  to the top of the diode load resistor,  $R_1$ .  $V_{2A}$  is connected as a clipper and functions as a clipper to square the waveshape. The plate of  $V_{2A}$  is direct-coupled to the grid of cathode follower,  $V_{2B}$ , and the output

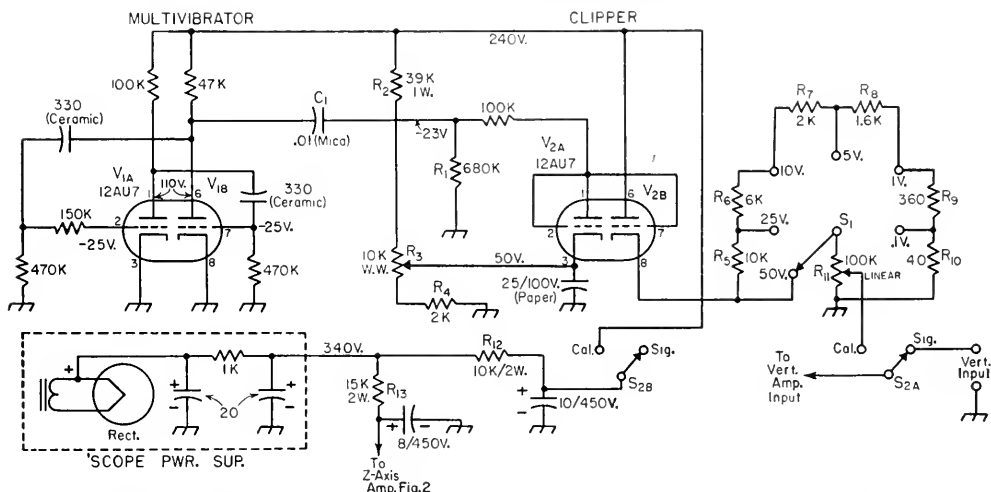

Fig. 1 — Circuit of the voltage calibrator. All resistors  $\frac{1}{2}$  watt, unless otherwise specified.

$R_{11}$  — Ohmite CU-1041.

$S_1, S_2$  — Rotary switch.

Voltage-calibrator sub-chassis wired and ready for installation.

voltage of the calibrator appears across the cathode-resistor string,  $R_5$  to  $R_{10}$ . The maximum peak-to-peak voltage in each position of  $S_1$ , as indicated, may be taken from the arm of the switch and attenuated through the gain-control potentiometer  $R_{11}$ .

Potentiometer  $R_3$  in the voltage divider,  $R_2R_3R_4$ , controls the bias on the cathode of  $V_{2A}$  which, in turn, controls the output voltage of the calibrator. Output voltage is taken from the arm of  $R_{11}$  to the calibrating position of  $S_{2A}$  for comparison with the signal being measured.

### Z-Axis Amplifier

The first tube in the Z-axis amplifier (Fig. 2) is a 12AU7 duo-triode acting as a phase inverter. The cathodes of both sections are tied together using the same cathode resistor,  $R_{14}$ . The second section operates as a grounded-grid amplifier. Signals from the plate of each section to the ends of the center-tapped potentiometer  $R_{15}$  are equal and 180 degrees out of the phase. This potentiometer must be linear, with 25,000 ohms

each side of center tap. The tube gives a gain of four for each phase.

The signal is then taken from the arm of the gain-and-phase-control potentiometer,  $R_{15}$ , through  $C_2$  to the input grid of  $V_4$ .  $V_4$  is a triode voltage amplifier with a gain of 12, thereby giving a total gain of 48 through the amplifier in either a positive or negative direction. From the plate of  $V_4$ , the signal is passed on to the top of  $R_{16}$  and through  $C_3$  to the grid of the cathode-ray tube. Positive signals at this point brighten the trace, while negative signals bias the tube toward cut-off.  $C_3$  must be a high-voltage capacitor to withstand the negative d.c. voltage on the grid of the tube.

### Blanking

The pulse for blanking is taken from the oscilloscope horizontal-sweep oscillator and differentiated through  $C_4$  and  $R_{17}$ . During the slow rise time of the sawtooth sweep, no voltage is developed but the rapid fall in voltage at the end of the sawtooth develops a pulse at the junction

Fig. 3 — Sketch showing dimensions of the two subchassis. The one to the left is for the Z-axis amplifier; the one to the right is for the voltage calibrator.

of  $C_4$  and  $R_{17}$ , which is impressed on the grid of  $V_{3A}$  through  $S_{3A}$  when in its blanking position. The size and width of this pulse is adjusted by  $R_{17}$ , and  $R_{15}$  is adjusted toward its positive position, putting a positive pulse on the grid of  $V_4$  which, in turn, puts a negative pulse on the grid of the cathode-ray tube, thus biasing the grid to cut-off, and blanking during the retrace.

### Construction

The material used in the construction of the two subchassis is 0.026-inch copper sheet, since it is easily worked. They were cut out, drilled and bent to shape in a small vise, as shown in Figs. 3A and 3B.

A photograph shows the voltage-calibrator chassis with the components mounted and wired. The calibration potentiometer,  $R_{11}$ , is shown mounted on the lip of the chassis, with the multiplier switch ( $S_1$ ) just below. The Z-axis amplifier chassis is bent in the opposite direction, with the gain-and-phase potentiometer,  $R_{15}$ , mounted on the lip, and the selector switch  $S_3$  below. These four controls are reached with extension shafts through panel bushings, the remaining controls being mounted on the front panel.

In the photograph of the voltage calibrator, the potentiometer shaft,  $R_3$ , may be seen extending through the chassis where it is available after assembly for adjustment of the voltage-calibrator output. The potentiometer is mounted between the tubes on the top side of the chassis, its leads being fed through a small grommet to the underside.

Both amplifiers should be completely wired according to the schematics, leaving signal, B+ and heater leads long enough to reach their connections. Wiring is not at all critical and point-to-point wiring was employed to conserve space.

The holes in the front for the added

controls are all  $\frac{3}{8}$ -inch diameter. The hole for the shaft of the voltage-calibrator gain potentiometer,  $R_{11}$ , is centered  $2\frac{1}{4}$  inches above the main chassis, and midway between the oscilloscope vertical-gain and frequency-selector controls. The hole for the shaft of the multiplier switch,  $S_1$ , is  $1\frac{1}{8}$  inches below.

Rear view of oscilloscope with the cathode-ray tube removed, showing the added subassemblies. The voltage calibrator is in the foreground, and the Z-axis amplifier above and to the left.

« Fig. 4 — (Left) Voltage-calibrator square wave with low horizontal sweep frequency. (Right) Same signal with high-speed sweep.

« Fig. 5 — (Left) Sine wave before return-trace blanking. (Right) Sine wave after return-trace blanking.

« Fig. 6 — (Left) Intensity modulation of 2-microsecond positive pulse. (Right) Z amplifier used for trace brightening.

« Fig. 7 — (Left) One cycle of sine-wave input to vertical modulator by 4 cycles of square wave (right).

« Fig. 8 — (Left) Marker-generator signal on baseline. (Right) Marker-generator signal putting a hole in baseline.

The voltage-calibrator switch,  $S_2$ , is mounted on the panel in the most available position between the oscilloscope vertical-input attenuator switch and the vernier frequency control.

The hole for the shaft of the Z-axis gain and phase control,  $R_{15}$ , is centered  $2\frac{3}{4}$  inches above the main chassis, and midway between the frequency-selector switch and the horizontal gain control. The hole for the shaft of the selector switch,  $S_3$ , is  $1\frac{1}{8}$  inches below. The blank-phase potentiometer,  $R_{17}$ , is mounted on the panel midway between the frequency-vernier and synchronizing controls. The Z-axis input jack is located just above the horizontal input switch.

The placement of the two subchassis, with their extension shafts through the panel bushings, is shown in the rear-view photo of the 'scope. The Z-axis amplifier chassis is on the left side of the photograph, just behind the 'scope horizontal-sweep-amplifier tube (6J5) and the voltage-calibrator chassis is on the right in front of the power-supply rectifier tubes.

The Z-axis amplifier draws only 8 ma. in operation, and the voltage-calibrator requires 10 ma., so they may be operated from the oscilloscope power supply, as shown in Fig. 1. The power-supply output voltage is 340. This potential is dropped to 240 volts through  $R_{12}$  for the voltage calibrator, and to 250 volts through  $R_{13}$  for the Z-axis amplifier. In the calibrate position,  $S_{2B}$  puts plate voltage on the calibrator, and  $S_{3B}$  has the same function for the Z-axis amplifier. It is necessary to provide another filament source for the tubes, so a small filament transformer,  $T_1$  in Fig. 3, is mounted alongside the power transformer, under the main chassis.

After the units were installed and the wiring completed, switch positions on the front panel were labeled with decals as shown. The voltage-calibrator multiplier switch shows maximum output voltages of 50, 25, 10, 5, 1 and 0.1. These voltages may be attenuated at each position with the gain potentiometer,  $R_{11}$ , which is calibrated in tenths on the front panel.

The only adjustment necessary after completion is to set the output level of the voltage calibrator. This calibration is in peak-to-peak volts which is equal to 2.88 r.m.s. voltage. Dividing the maximum output voltage of 50 by 2.88 is equal to 17.4 volts r.m.s. Turn on the oscilloscope, put  $S_1$  in the 50-volt position, and turn up the gain pot,  $R_{11}$ , to maximum output. A square wave should appear on the screen, as shown in Fig. 4 (left), if the horizontal sweep is at a slow rate. However, if the sweep speed is increased, an image such as Fig. 4 (right) will appear. Connect an a.c. voltmeter to Pin 8 of  $V_2$  and adjust potentiometer  $R_3$  so the r.m.s. output voltage reads 17.4 volts. The calibrator is now ready for operation.

Turn  $S_2$  to the signal position, and feed a sine wave into the 'scope input. Adjust the trace to any convenient height between selected lines on the screen mask. Turn  $S_2$  to the calibrate position and adjust the multiplier switch,  $S_1$ , and gain pot,

$R_{11}$ , till the square wave on the screen is at the same height between the previously selected lines. The sine-wave peak-to-peak voltage may now be read by noting the position of the multiplier switch and the percentage of the gain pot used. For example: If the multiplier switch reads 5 and the gain pot 7, there would be an indicated voltage of  $0.7 \times 5$ , or 3.5 volts peak-to-peak or, dividing by 2.88, 1.22 volts r.m.s.

Turn  $S_2$  to the signal position, put the sine wave back on the 'scope screen and turn up the intensity control so both the sine wave and retrace are visible as at 5 (left). Turn  $S_3$  to the blanking position, advance the Z-axis gain control,  $R_{13}$ , to its positive position, and advance the blanking-phase pot,  $R_{17}$ , until the retrace just disappears as at 5 (right). The small bit of retrace left on 5 (right) would be eliminated by increasing the gain of the blanking control. At low frequencies most of the resistance in  $R_{17}$  will be needed for blanking, but this becomes successively less as the frequency (speed) is increased.

### Z-Axis Amplifier

Set the Z-axis pot,  $R_{15}$ , to zero (midposition). Turn  $S_3$  to the Z-amplifier position. Take the sine-wave injection out of the vertical input and put a sine-wave signal of approximately 1 volt, 1000 c.p.s. into the Z-axis input jack. Set the 'scope horizontal sweep at approximately 100 c.p.s., and advance the Z-axis gain control toward either positive or negative polarity, readjusting the sweep rate at the same time until the baseline becomes a series of dashes. The number of dashes will show the frequency ratio of the sine-wave input to the sweep frequency and is a handy way to check frequency rate.

Turn the Z-axis pot to zero position. Leave the sine-wave signal on the Z-axis input, and inject the same signal into the vertical input of the 'scope, placing several cycles on the tube screen. Turn down the 'scope intensity control until the trace disappears, and advance the Z-amplifier gain control toward positive. The trace should appear similar to Fig. 6 as the cathode-ray-tube grid is driven positive from cut-off by the positive part of the Z-axis signal.

Fig. 6 (left) shows a series of two-microsecond positive pulses which were barely visible on the screen before brightening with intensity modulation, accomplished by injecting the signal into both vertical-input and Z-axis terminals. Fig. 7 shows one cycle of sine wave into the 'scope vertical input with four cycles of square-wave input to the Z axis, and is another method of checking frequency rate.

Fig. 8 (left) shows the horizontal baseline with a marker-signal input to the Z-axis amplifier. The Z-axis gain control is advanced toward positive phase, giving a bright marker on the baseline. Turning the gain control toward negative phase puts a hole in the baseline, as at 8 (right).

Further information on the possible applications of the Z-axis amplifier may be found in Rider's *Encyclopedia on Cathode-Ray Oscilloscopes*.

# Band-Scanning — The Easy Way

## A Simple Means of Automatic Receiver Tuning

BY K. R. JONES,\* W7OSL

• This simple gadget should appeal to many, both as a novelty and as a utility. It lets you sit back and hear the sigs go by. The lazy man will find it just the thing for watching for band openings. It requires no alterations of the receiver, and can be connected or disconnected in a second or two.

HAVE you ever spent valuable time tuning across the 10-, 15-, or 20-meter bands without finding a single signal? Then you must have wished for an easier way to catch the band openings which are so rare in this period of the sunspot cycle. Perhaps what you need is an automatic tuner to operate the receiver while you sit in an easy chair reading *QST*.

Of course, any well-equipped machine shop could attach an assortment of gears, cranks and motors to your receiver that would do the job, but most hams would prefer to get the results without altering their receivers. It can be done. Most of the needed parts may even be in your junk box now.

The theory is easy. All you have to do is vary the tuning of the receiver's high-frequency oscillator at a slow rate. A motor-driven capacitor clipped on in parallel with the h.f. oscillator tuning capacitor will do the trick, and the only disadvantage is a temporary shift in dial calibration during the time the motor-driven scanning capacitor is in use. Theoretically, the r.f. and mixer tuning should also be varied, but most receivers in the lower-price brackets have only one r.f. stage and the front-end passband is so broad that little loss in gain can be noticed over a small frequency range when only the oscillator is tuned.

The unit illustrated was assembled for use with an NC-57 receiver. An old electric clock motor was used as the base and a scrap of aluminum was bent to form a mounting for a ball-bearing butterfly capacitor, as shown in the photograph. The shaft coupling was made from a small block of plastic. An APC-type padding capacitor was fastened on top and connected in series with the butterfly capacitor to vary the bandwidth scanned. The whole unit is small enough to fit inside the receiver near the tuning-capacitor gang.

Although the unit scans only about 200 kc. on the v.h.f. amateur bands, it has proved very satisfactory in detecting band openings. It has

also been very interesting to operate it on bands where there is plenty of activity. At a rate of two scannings (one complete revolution of the capacitor shaft) per minute, the tuning is covered so slowly that several words can be heard from each station as it is passed, and familiar voices can be recognized.

### Construction

Specifications are listed with the schematic, but as identical parts may not be available, several points in construction should be stressed. First, and most important, is keeping stray

Fig. 1 — Circuit of the simple band-scanner.

C<sub>1</sub> — 35- $\mu$ mf. (stator to stator) ball-bearing butterfly variable (Burstein-Applebee Cat. No. 18B1027). Also see Addendum.

C<sub>2</sub> — APC type air trimmer (see Addendum).

M — Synchronous clock motor, 1 r.p.m.

S<sub>1</sub> — Toggle.

capacitance at a minimum since this will have a considerable effect on how far the r.f. stage must be detuned from normal.

Second, the butterfly capacitor must turn very easily. The ball-bearing type shown is ideal, but with some ingenuity in loosening and lubricating the bearings, a plain-bearing type might be satisfactory. A capacitor with a stop cannot be used, of course.

Third, the capacitor shaft should be very carefully aligned with the motor shaft to prevent excessive bearing friction and overloading of the motor during constant use. If the alignment cannot be done accurately, a flexible shaft coupling should be used.

Fourth, any different type of motor than a clock motor should be checked for radio interference before construction is begun. The synchronous clock motor shown caused no interference while operating inside the receiver, but other small motors could generate a great deal of noise.

Fifth, the 115-volt wiring to the motor should be carefully insulated. Every amateur should realize that 115 volts a.c. is potentially just as dangerous as the higher d.c. plate voltages found in power supplies.

\* 627 Fifth Ave., Salt Lake City, Utah.

### Adjustment

Adjusting the scanner for operation is not difficult with the following procedure:

1) Set the butterfly capacitor to approximately the center of its capacitance range by running the motor through part of a revolution.

2) Attach the lead clips in parallel with the receiver oscillator tuning capacitor. On the NC-57 this is the capacitor section next to the front panel. The lead from the APC padder should attach to the stator, and the other lead to the capacitor frame.

3) Use a VFO, crystal oscillator, or signal generator to obtain a strong signal in the middle of the desired band. Tune in this signal with the receiver tuning dial. Since the scanning unit adds capacitance in parallel with the tuning capacitor of the receiver, the setting may be one to several hundred kilocycles higher than the normal dial setting.

4) Peak the signal with the antenna-trimmer control if the receiver has one.

5) Run the butterfly capacitor to its maximum and minimum settings and check these frequencies with the VFO or signal generator. Then adjust the APC trimmer to more capacitance for a wider scanning range or to less capacitance for narrower scanning range. (The total capacity added by the unit is of course equal to  $\frac{C_1 \times C_2}{C_1 + C_2}$ , so, by decreasing  $C_2$ , the total capacitance and the scanning width are reduced.)

6) Repeat Steps 3, 4, and 5 until the desired range is covered.

The amount of receiver tuning capacitance in use is different on each amateur band, so the scanner must be readjusted for each band.

To restore normal receiver operation, just unclip the scanner, lift it out, and reset the antenna trimmer. This scheme is, of course,

not useful with receivers whose tuning ranges are restricted to the amateur bands.

### Addendum

The scanning capacitor used by the author, being of the butterfly type, goes through its capacitance range four times for one complete revolution of its shaft, and therefore the band is swept four times — twice in each direction. The butterfly type with ball bearings may not be generally available on the market. However, the standard-type Hammarlund VU-30 should make a satisfactory substitute, although it will take twice as long to sweep the band (twice per revolution instead of four times). The VU-30 has a maximum resultant capacitance (two sections in series) of 31.5  $\mu\text{mf}$ .

To obtain an idea of the range to be expected on the various lower-frequency bands, the arrangement of Fig. 1 was tried on a Hallicrafters SX-71, with a Johnson 27- $\mu\text{mf}$ . capacitor at  $C_1$ , and a 100- $\mu\text{mf}$ . unit at  $C_2$ .

With  $C_2$  set at minimum, the band-set on the SX-71 had to be readjusted about 200 kc. higher, and the tuning range of  $C_1$  was approximately 40 kc. With  $C_2$  set at maximum, the band-set had to be set about 300 kc. higher, and the range of  $C_1$  was about 300 kc.

On 40, the band-set was adjusted about 200 kc. higher,  $C_2$  at minimum, and the tuning range was about 40 kc. With  $C_2$  at maximum, the band-set was about 250 kc. higher, and the range slightly over 300 kc.

On the 20- and 10-meter bands, the band-set adjustment was only slightly different than normal. On 20, the bandspread range of  $C_1$  could be varied from about 30 kc., with  $C_2$  at minimum, to about 300 kc. with  $C_2$  at maximum. The range on 10 was about 2 Mc. with  $C_2$  at minimum, and with  $C_2$  set at about half capacitance, the entire band was covered.

This simple band-scanner can be thrown together in a few minutes. The ball-bearing capacitor driven by the clock motor is mounted, with its shaft in line with that of the motor, on a scrap of aluminum. The range-adjusting capacitor,  $C_2$ , is suspended from  $C_1$  on stiff leads connecting it to the latter.

# A Tripler for the 1215-Mc. Band

*Crystal-Controlled Output with 420-Mc. Drive*

BY RUSSELL W. ROBERTSON,\* W6DQJ

• Most of the work done so far on 1215 Mc. has been with oscillator-type rigs, which leave much to be desired in the way of stability and efficiency. Here is a solution in line with more modern techniques: a tripler that can be driven with a low-powered 420-Mc. stage.

Now that the design of stable equipment for the 420-Mc. band is fairly well standardized, experimentally inclined hams are thinking of going higher in frequency. Most of the work done so far on 1215 Mc. and higher bands has been with oscillator-type transmitters. This can be fun, but experience has shown, as on all lower bands, that if we are to accomplish any real good it must be with something more stable and reliable in performance.

Choice of tubes for use as frequency multipliers or r.f. amplifiers is limited enough at 420 Mc. When we go to 1215, there is practically no choice at all. The lighthouse types such as the 2C40 and 2C43 work well at very low power, but if we want to go over the milliwatt level we have only the 2C39A to look to. There are bigger tubes, of course, but their cost puts them out of the reach of most hams.

Tank-circuit design definitely leaves the coil-and-condenser field when we move up from 420 Mc. This shift from coils to lines to cavities leaves the average ham with the feeling of having entered another world, but construction of suitable cavities can be managed without too much in the way of machine tools. The tripler described here is a combination of modified surplus and home-made tank circuits that should not be beyond the ability of many experimenters.

The photographs show the tripler in both assembled and knocked-down form. The input circuit was made from a coaxial tank circuit of an r.f. amplifier from an ASB-series receiver designed for 450 to 500 Mc. Enough detail is apparent so that a near duplicate could be made, if the surplus variety is not available, though having the ASB cavity makes the job quite a bit simpler. The original amplifier was designed for use with a 446A lighthouse tube, but most of the parts can be salvaged for this application with the 2C39A.

## *Making the Cavities*

The ASB cavity, if used, should be cut apart carefully so that it is  $1\frac{3}{4}$  inches long. The inside diameter is  $2\frac{3}{16}$  inches. The original cathode ring is salvaged for use as a plate contact for the 2C39A. The grid ring is used for the grid contact

for the 2C39A, also. Both these are spring-contact finger stock and are probably the most difficult parts to make if suitable materials are not at hand. The plate line of the 446A is cut to a length of  $1\frac{7}{16}$  inches, and then slotted to take the cathode sleeve of the 2C39A. The insert that originally held the plate contact to the plate line is slotted to a depth of about  $\frac{3}{16}$  inch, and then pinched together slightly to fit into the heater connection on the 2C39A. Heater voltage should be fed through shielded wire. Insert the

The tripler for 1215 Mc. uses a 2C39A tube. The small cylinder at the bottom of the assembly is the 420-Mc. cathode tank circuit, and the 1215-Mc. tank is a radial cavity. Air should be blown across the plate fins in normal operation.

heater connection in the end of the tube before putting the tube into the cavity.

The radial plate cavity is made of thick-wall aluminum tubing, 3 inches inside diameter and  $2\frac{5}{32}$  inch long. Silver-plated brass would be fine, if you can manage it. Top and bottom covers are  $\frac{3}{32}$ -inch aluminum, fastened to the cylinder with six No. 4 screws each. The bottom cover is drilled and countersunk to take four 6-32 flat-head machine screws that hold the cathode line onto the assembly. The cars into which these screws thread are integral parts of the ASB tank circuit.

Both grid and plate contact rings are insulated from the case for d.c., but there must be capacitance to the case to make the cavities function properly. The rings are separated from the cavity by sheets of Teflon, though any good insulation that will stand heat may be used. The grid contact ring is held to the cathode side of the bottom cover by a round sheet of flashing copper,  $2\frac{1}{4}$  inches in diameter. The screws that hold this in place must, of course, be insulated from either the copper plate or the cover. In the photograph, a short insulated lead for the grid leak is shown

\* 8118 S. Chaney Ave., Rivera, Calif.

attached to a lug under one of the nuts that holds this assembly together. The screw is insulated from the cavity. The other three screws are insulated from the copper plate, but not from the cavity. The plate contact ring, on the top of the cavity, is treated in like manner, except that only three screws are used. One of these makes contact to the ring and is used for a plate-voltage terminal. The other two are insulated from the ring, but not the cover.

Inductive coupling is used for both input and output. Details of the coupling loops should be clear from the photographs. The cathode cavity is tuned by means of a disk capacitor, the fixed plate of which is part of the cathode line. The movable plate is mounted on a fine-thread screw, which runs through a threaded fitting attached to the inner wall of the cavity. The end of the screw is slotted to permit adjustment from outside the cavity. Coupling out of the cavity can be varied by turning the Type N coaxial fitting. Maximum coupling is with the loop vertical. This position is indicated with a dot of red paint on the sleeve so placed that it lines up with the slot in the fixed portion of the fitting when the loop is vertical. Normal coupling is about 15 degrees from the vertical position. Tuning is done with a  $\frac{1}{4} \times \frac{5}{8} \times \frac{3}{8}$ -inch piece of copper, fastened to a  $\frac{1}{4}$ -inch polystyrene rod that is brought out through a shaft bearing. Pulling the rod out raises the tuning range higher in frequency. Normal tuning is done by rotating the rod.

### Operation

Drive for the tripler is furnished by a 9903 tripler to 432 Mc. With a 10,000-ohm grid resistor, grid current in the 2C39A is about 12 ma., dropping to 10 under load. So far the tube has been operated at no more than 450 volts, as no cooling has been used. At this voltage the plate current dips to 35 to 40 ma. at resonance.

No means of measuring output is available, but the appreciable dip indicates that fair efficiency can be expected.

Sufficient cooling for low-power operation may be obtained by blowing air across the tube's plate fins. If anything approaching the maximum rating for the tube is to be run, a cowling should be used around the cooling fins, to confine the air flow where it will do the most good. Air should also be blown through the cathode cavity. Holes should be drilled in this cavity for ventilation, even at low power levels. Air flow should be increased as the plate dissipation is raised. With no cowling, a flow of 10 cubic feet per minute will take care of up to 40 watts plate dissipation. With a cowling just larger than the plate fins, 10 c.f.m. will allow up to 85 watts dissipation. Running the maximum of 100 watts dissipation raises the air requirement to about 13 c.f.m. There should be a forced air flow through the cathode cavity if more than about 25 watts dissipation is anticipated.

The 2C39A should be inserted into and removed from the cavity with care. The grid plane is held to the glass seal with only a ring of cement; it can be broken loose very easily if any strain is applied to the grid, cathode or heater terminals. Remember, too, that the top plate is hot for d.c. Do not attempt to handle the cavity when plate voltage is applied.

In a cavity very similar to the one described here, it was found that the tube could be made to oscillate by reducing the capacitance in the cathode circuit. The grid resistor was reduced to 1200 ohms for this purpose. The oscillation frequency was around 1280 Mc., but by some re-tuning of the cathode cavity the frequency was changed to about 969 Mc. Obviously some accurate method of checking frequency should be available before operation of the unit as an oscillator is attempted.

Components of the 1215-Mc. tripler. Lower left: bottom plate of the 1215-Mc. plate cavity, showing grid-contact ring and capacitor plate. Right front: top cover, with plate-contact ring and bypass element. Upper left shows interior of the cathode cavity, with the radial plate cavity in the upper right. The 2C39A and the heater contact lead are in the center of the picture.

# Subinterval Markers from a 100-Kc. Crystal

More on Simple Secondary Standards

BY W. C. SMITH,\* K6DYX

BEING in possession of an old and uncalibrated receiver, the article, "50-Kc. Markers from a 100-Kc. Crystal," *QST*, July, 1954, was of particular interest to me. If this circuit would divide a frequency by two, why not by five, or even ten, and yield markers every 20 or 10 kc.?

The crystal calibrator unit complete with power supply.

With this possibility in mind and, with the help of H. Minor, KN6JIE, the circuit of Fig. 1 was assembled. We carried out extensive tests and

\* 67 Cuesta Vista Drive, Monterey, Calif.

• This article is supplementary to one that appeared in the July, 1954, issue. K6DYX shows how additional markers at intervals as small as 6½ kc. may be obtained from a 100-kc. crystal. Included is a series of graphs that help to explain the manner in which the circuit works.

think the results would be of interest to other hams.

## Circuit Operation

It was immediately apparent that the explanation offered in the original article is incorrect. The grid resistor has little effect on the frequency of the subharmonics. The cathode by-pass capacitor is likewise ineffective, although there is an optimum range for both these components in their effect on the stability of operation.

The proper explanation seems to be that the relaxation pulse from the screen circuit is fed to the LC network composed of  $L$ ,  $C_1$  and  $C_2$  through the crystal operating at near its series resonant frequency. A transient oscillation is excited in the tuned circuit which, for 50-kc. markers, has a frequency of 350 kc. Thus the grid signal consists of the resonant frequency of the crystal with the frequency of the tuned circuit superimposed upon it (Fig. 2A). The

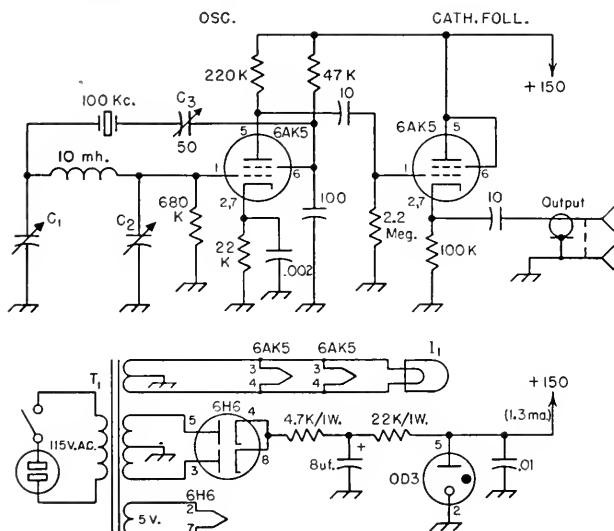

Fig. 1 — Circuit for obtaining subinterval markers from a 100-kc. crystal. All capacitances less than 0.001  $\mu$ f. are in  $\mu$ f.  $C_1$  and  $C_2$  are 50- $\mu$ f. air trimmers. All resistors ½ watt, unless otherwise noted.  $T_1$  — Power transformer: 750 v.c.t., 40 ma.; 5 volts, 2 amp.; 6.3 volts, 2 amp.

Bottom view of the crystal calibrator.

positive crests of this complex wave trigger the tube in such a way that the screen voltage appears as in Fig. 2B, and the output voltage as in Fig. 2C. There is little or no synchronizing action, since the crystal does not feed back any of the 350-ke.

(A)

(B)

(C)

Fig. 2 — Oscillograms when circuit is adjusted for 50-ke. markers. A — Grid voltage. B — Screen voltage. C — Output voltage.

frequency present in the screen voltage. The cathode bias is important, because the tube triggers as its grid returns from beyond cut-off, but the capacitor across the cathode resistor serves only to stabilize the bias, and has no direct effect on the frequency. The time constant of the screen circuit should be less than the period of the crystal for strong relaxation pulses. In this case it is  $47K \times 100 \mu\text{f.} = 4.7$  microseconds, whereas the period of the crystal is 10 microseconds.

### Other Subharmonics

The existence of 50 ke. and harmonics thereof in the output voltage is obvious from Fig. 2C. Here every second one of the 100-ke. sawtooths is distorted. According to the theory of operation given above, it should be possible to distort every third tooth by tuning the  $LC$  circuit to  $333\frac{1}{3}$  ke. and obtain markers every  $33\frac{1}{3}$  ke. This was found to be the case. In fact, it was possible in our set-up to distort the sawtooths at any periodicity up to the 15th, yielding markers every  $6\frac{2}{3}$  ke.! A series of frequencies to which the  $LC$  circuit was tuned, the ratio of these frequencies to the 100-ke. fundamental, and the separation of the marker frequencies is shown in Table I. This is not the only series that will produce subharmonic distortion in this way. A ratio of  $3/2$ ,  $5/2$ ,  $7/2$ ,  $9/2$ , etc., will result in  $1/2$  frequency harmonics. A formula giving the frequency of the tuned circuit,  $L$  with  $C_1$  and  $C_2$  in series across it, is:

$$F_t = nF_1 \neq F_h$$

Where  $n$  takes on integral values,  $F_1$  is the fundamental frequency, and  $F_h$  is the frequency separation of the harmonics it is desired to produce. This formula was verified in our experimental work, but the frequencies shown in Table I seemed to work out best.

Fig. 3 shows the grid-voltage wave and the

output-voltage wave when the circuit was adjusted for 10-kc. separation of the markers. Note that the frequency ratio in Fig. 3A is clearly 31 to 10. The adjustment of either  $C_1$  or  $C_2$  is rather critical because the frequency of the tuned circuit must be within a few hundred cycles of 310 kc. We found it advisable to use a cathode-follower buffer after the oscillator circuit to avoid detuning when we changed loads. Adjusting the fundamental to exactly 100 kc. is also critical, because tuning the  $LC$  circuit pulls the crystal a little and it is necessary to readjust  $C_3$ .

### Adjustment Procedure

For our experimental work we had available rather ideal equipment in the way of synoscopes and frequency counters, but the unit has been adjusted from scratch and used in the home station with very satisfactory results. The best procedure is to establish oscillation, and adjust either or both  $C_1$  and  $C_2$  until clean markers are heard on the station receiver at 100-kc. intervals.

(A)

(B)

Fig. 3 — Oscillograms obtained when circuit is adjusted for 10-kc. markers. A — Grid voltage. B — Output voltage.

Then tune the receiver to the approximate point where the subinterval marker is desired and adjust either or both  $C_1$  and  $C_2$  until a clear, clean marker is heard. No difficulty at all was experienced in getting markers every 20 kc., but for closer intervals one should check that there are the required number between the 100-kc. points previously noted. After the marker intervals have been established, zero-beat with WWV by adjustment of  $C_3$ .

TABLE I

Frequency of Tuned Circuit, Kc.	Ratio of Tuned Circuit and Crystal Frequencies	Separation of Markers, Kc.
350	7 to 2	50
333 $\frac{1}{3}$	10 to 3	33 $\frac{1}{3}$
325	13 to 4	25
320	16 to 5	20
316 $\frac{2}{3}$	19 to 6	16 $\frac{2}{3}$
314 $\frac{1}{2}$	22 to 7	14.285
312.5	25 to 8	12.5
311.1	28 to 9	11.1
310	31 to 10	10

### Construction

The unit shown in the photographs includes a cathode-follower buffer stage and a built-in power supply with voltage regulation. The circuits of these sections also appear in Fig. 1. The components are assembled on a 7 × 7 × 2-inch aluminum chassis. The power transformer, 6H6 rectifier and 0D3/VR150 voltage-regulator tube are lined up along the right-hand edge of the chassis. At the left are the 100-kc. crystal (at the rear), the oscillator tube, and the cathode-follower tube. A coax output connector, pilot lamp and power switch are set in the front edge of the chassis.

In the bottom view, at the top,  $C_3$  is to the left, and  $C_2$  to the right.  $C_1$  may be seen near the center. Clearance holes have been cut in the chassis so that these three variable capacitors can be adjusted from the top with a screwdriver.

# Six Meters for the Beginner

## Part III — Transmitting Equipment and Antennas

BY EDWARD P. TILTON, W1HDQ

THE 50-Mc. band is attractive to the fellow who is just getting started in that it is still possible to do interesting work on 6 with very low power. Increasing power pays off, of course, but plenty of good stuff has been worked with no more than a few watts. The kind of work you expect to do will determine how much power you will need.

If you want only a rig that will give you a good signal locally, there is little reason to go beyond the receiving tube power level. Something like the rig described here will do the job nicely, and it will help the interference problem markedly if you stick with low power. It may surprise you to learn that a 10-watt rig is quite capable of giving a good account of itself when the band is open, too. When sporadic-E skip communication is possible at all, signals are usually quite strong; thus there is not a large difference in results whether high or low power is used. Under borderline conditions, the extra margin over the noise that the high-powered signal enjoys is a major factor in making contacts, but there is probably no field in which low power works out to better advantage than in 6-meter DX. There is no real QRM, and it is unlikely that there ever will be, so we don't need high power to override other stations on the same frequency.

High power does pay off handsomely in one phase of v.h.f. work. To have a wide reliable operating radius you have to lick one enemy: the noise level. The edge of your normal coverage is the point at which your signal disappears into the receiver noise. This is farther out when high power is used, whether you're working on 50, 144, 220 or 420 Mc. (That's why we have super-powered TV stations.) If your signal is running S9 at the receiving point, increasing power from 10 to 100 watts (10 db., or about 2 S-units) won't sound like much. But if you are just a whisker over the noise, that 10 db. will put you right up there in the solidly-readable category.

When you're after that additional 10 db. of signal, the first place to go all-out is in the antenna. Decibels come easier and cheaper there than in the transmitter. In v.h.f. work it is approaching the ridiculous to increase power while using an ineffective antenna. On 80 you may have to put up with a makeshift, but on 6 almost everyone can manage an array that will give good results.

With TV antenna components and rotators available at moderate cost, there is little reason for not having a rotatable array. Even a dipole works well if you can aim it in the right direction for every station, and two or three elements will do a real job. If you *have* to, you can make con-

tacts on 6 with an antenna designed for lower frequencies, but the chances are that it won't do nearly as well as even the simplest rotatable antenna system designed for the job. If you can put up a 4-element array of the type described in all recent editions of the *Handbook*, you'll have gained as much, in respect to coverage with a dipole, as would result from increasing your transmitter power from 10 to 100 watts. It will pay a much larger dividend, actually, for it will increase your receiving performance by at least as great a factor.

### A Low-Cost 10-Watt Transmitter

The little rig pictured here will take an input of 10 to 15 watts, when used with a 300-volt plate

A 2-tube 50-Mc. transmitter, capable of running 10 to 15 watts input. The 4-pin connector on the front wall of the chassis may be plugged directly into the modulator, or a cable may be run between the two units. Tip jacks on the left end of the chassis are for measuring final-stage grid and cathode current.

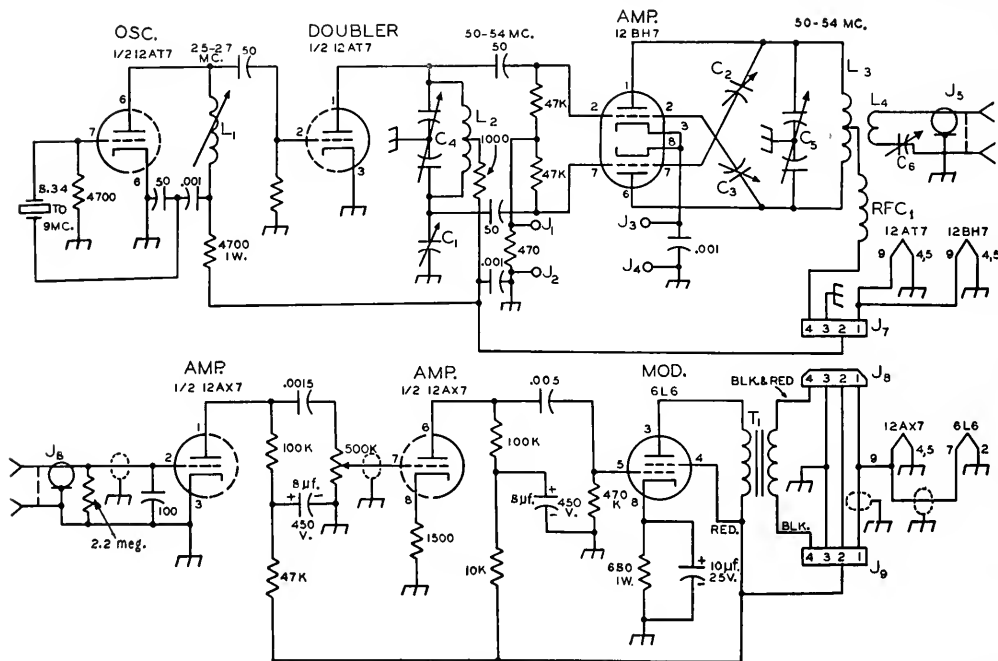

supply, and it can be adapted readily to portable or mobile, as well as home-station use. When used in conjunction with the modulator described in *QST* for December, 1954, it makes a complete 'phone-c.w. transmitter that will give a good account of itself on 6. After you've made your start with the rig as described, it may be used to drive higher power stages at a later date.

Two dual triode tubes are used. A 12AT7 serves as an overtone oscillator and doubler, using 8.3- or 25-Mc. crystals. Output is on 50 Mc., driving a 12BH7 push-pull amplifier. The second tube can also be a 12AT7, but the larger tube handles the power more readily. The rig fits a 5 by 7 by 2-inch aluminum chassis, with plenty of room to spare.

Building the transmitter r.f. section and modulator in separate units is highly recommended, as the r.f. section for another band can be plugged into the modulator at any time. If you decide to make changes in either unit, the other can be left

Power is brought into the transmitter through a 4-pin fitting on the front wall of the chassis. This plugs into a matching fitting on the adjacent wall of the modulator unit. If it is desirable to mount the r.f. and modulator units separately, the two may be connected by a 4-wire cable of any convenient length. On the left edge of the chassis are two pairs of tip jacks for measur-

Photographs of the modulator unit will be found in December, 1954, *QST*, pages 27 and 30. Arrangement of modulator parts is not critical. The complete diagram and parts required are given here, so that the unit may be built without reference to the earlier article, if necessary. Some minor modifications are included, so follow the

diagram given here, not the earlier one, in wiring the modulator. The power supply may be connected either through the modulator, or directly to the r.f. section. This permits operation of the transmitter on c.w. while the modulator unit is under construction.

The modulator was shown originally with a 6V6GT in the output stage. This may be used with the 50-Mc. transmitter, but more audio can be developed with a 6L6. If the rig is used for mobile work, retention of the 6V6GT would be advisable, in the interest of lower power drain. When the latter is used, the total power drain, with a 300-volt supply, is less than 100 ma., making it very suitable for operation from a vibrator or generator supply.

### Adjustment

In hooking up the power supply a cable should be made up with a 4-pin female plug (Amphenol 78-PF4). This will attach to either  $J_9$  or  $J_7$ . The hot side of the 6.3-volt circuit (a.c. or d.c.) should be connected to Pin 1, the cold side and the negative side of the high-voltage circuit to Pin 3. The 300-volt lead is brought to Pin 2. This will energize the oscillator, doubler and audio circuits, but not the amplifier. It will be helpful if the power supply has a separate filament transformer for the transmitter heaters. In this way the tubes can be warmed up before applying the plate power, which will increase tube life. It will also make it possible to operate a 115-volt a.c. antenna relay, connected in parallel with the primary of the plate supply transformer, to switch the antenna to the transmitter when the plate power is applied.

Connect a short temporarily between pin jacks  $J_3$  and  $J_4$ , to close the final stage cathode circuit to ground. Connect a low-range milliammeter, preferably 0-5 or 0-10 ma., in pin jacks  $J_1$  and  $J_2$ , to measure the current developed in the final amplifier grid circuit when drive is applied. The positive terminal of the meter is connected to  $J_2$ . If a low-range meter is not available, a 100-ma.

meter, that will later be used to measure the final plate current, may be substituted. It will be hard to read current accurately on this scale, however.

If a power supply delivering 200 volts or so is available it may be used for initial tests on the r.f. section. If a 300-volt source is used, do not leave it on longer than necessary, until the stages are tuned up properly, as damage to the tubes may result during off-resonance operation. With the tubes hot, apply plate voltage. Have  $C_4$  set near the midpoint of its tuning range,  $C_1$  near minimum, and  $C_2$  and  $C_3$  set with their brass slugs about halfway into the brass sleeves. If the coils are the proper size, and the circuits properly wired, there should be grid current showing on the meter connected to  $J_1$  and  $J_2$ .

Adjust the position of the slug in  $L_1$  quickly for maximum amplifier grid current, and then tune  $C_4$  to see if it can be increased further. Depending on the characteristics of the crystal used, there may be oscillation only over part of the tuning range of  $L_1$ . In this case, grid current in the amplifier will appear suddenly as the coil slug is tuned through the resonance point. With some crystals oscillation may not start every time the plate voltage is applied if the coil is tuned exactly "on the nose" for maximum output. With it set for maximum amplifier grid current, apply plate voltage several times to be sure that the crystal always starts. Should it not do so, detune the coil slightly until easy and reliable starting is obtained.

It will be noted that the plate circuit of the doubler has a center-tapped coil tuned with a split-stator capacitor. R.f. power is coupled from both ends of this circuit into the grids of the amplifier. The output capacitance of the 12AT7 is in parallel with the upper half of the circuit, so some extra capacitance must be added at the bottom to achieve balanced drive. This is done with  $C_1$ , which should be adjusted for maximum grid current in the amplifier, readjusting  $C_4$  each time the setting is changed. It is not critical.

Before going any further, the frequencies in

the two stages should be checked. This can be done with a calibrated absorption wavemeter or grid-dip meter. Output from the oscillator should be on 25 to 27 Mc., the doubler between 50 and 54 Mc. Frequency can also be checked with a receiver that is capable of tuning these ranges, if you can be sure of its calibration. This is a somewhat risky business, however, as many spurious responses may show up in the receiver, and it is often difficult to tell when you have the right signal tuned in.

A listening check should be made to determine that the frequency is crystal controlled. With the receiver b.f.o. on, the signal should have a clear musical tone, and the frequency should show very little change when a metal object is moved near the oscillator plate coil,  $L_1$ .

The next step is neutralization of the amplifier. With no plate voltage on the 12BH7, tune its

Fig. 2—Two methods of feeding balanced lines or antennas with coax. The antenna coupler, above, can use components similar to those in the final stage plate circuit. Any impedance coax can be matched to any impedance balanced load, up to 600 ohms. The balun, B, gives a 4-to-1 impedance step-up. The outer conductors may be grounded to the antenna boom or mast.

plate circuit (with  $C_6$ ) through resonance, watching for variation in grid current. The latter is likely to drop sharply as resonance is reached. Adjust the neutralizing capacitors, keeping them at approximately equal settings, and check for the amount of grid-current dip at resonance, increasing or decreasing the capacitance of  $C_2$  and  $C_3$  until the grid-current dip disappears.

Now we're ready to check the final stage. Connect a 0-100 milliammeter between Pins 2 and 4 of the plug on the power cable. This will apply plate voltage to the final stage, and indicate its plate current. Tune  $C_5$  for minimum plate current, which will be about 5 to 10 ma. Now connect a lamp load to the output. This can be a 10- or 15-watt lamp, or four No. 44 (blue-bead) pilot lamps connected in parallel. None of these lamps will make a good load, but any will do for the initial check. With the load connected, tune the

series capacitor and retune the plate capacitor for maximum brilliance in the load lamp. This should show an output of about 5 watts, with an input of 10 or so. The position of the coupling coil,  $L_4$ , should be at the point of lowest coupling to  $L_3$  that will give the desired loading. Normal plate current, under load, will be about 40 ma., with a 300-volt plate supply.

The modulator is designed for use with a crystal or high-impedance dynamic microphone. The speech amplifier stages provide adequate gain, so long as the operator speaks directly into the microphone, at a distance of not more than two inches. A rough check on the required voice and gain levels can be obtained by watching the load lamp. There should be appreciable brightening of the lamp with ordinary speech.

The final stage may be keyed for c.w. operation by plugging a key into the tip jacks,  $J_3$  and  $J_4$ . With the key open no current will be drawn by the final stage. Stations nearby will hear the oscillator-doubler output, and will report "back-wave" when the key is up, but more distant stations will not hear this radiation to an appreciable extent. The cathode jacks may also be used for a meter, which will read the combined grid and plate currents. If neither key nor meter is connected, a short should be inserted in the jacks to close the cathode circuit. A conventional closed-circuit jack may, of course, be substituted for the tip jacks.

The same is true of the grid-current jacks,  $J_1$  and  $J_2$ , except that a resistor is connected permanently between their terminals, so whether or not a grid meter is connected will make no difference in the operation of the amplifier.

Normal operation of the transmitter, with 300-volt supply, will show approximately the following indications:

- Oscillator and doubler plate circuits — 10 ma. each.
- Final grid circuit — 4 ma.
- Final plate current — 35 to 50 ma.
- Output — 4 to 7 watts.

### Coupling to the Antenna

Any recent edition of *The Radio Amateur's Handbook* or *The ARRL Antenna Book* will give you dimensions and construction ideas for 50-Mc. antennas. If you want to feed your array with coaxial line, the feedline may be plugged directly into the output connector,  $J_5$ . In this case no further coupling devices are required, and adjustment involves only tuning  $C_6$  for maximum loading. Retune  $C_5$  each time an adjustment is made, to be sure that the final stage is tuned for minimum plate current. The position of the coupling loop,  $L_4$ , should be set so that 35 to 40 ma. plate current is drawn with the antenna connected.

If a long run of transmission line is required between the rig and the antenna system, lower line losses will be encountered if open-wire line is used. This will require some form of antenna coupler or balun, to take care of the transformation from the unbalanced coax to the balanced open-wire line.

(Continued on page 122)

# An Inexpensive Battery Charger for Field Use

BY J. S. REDDIE,\* W7FVI

**M**OBILE and emergency-powered portable stations in the 5- to 25-watt class depend almost exclusively upon the storage battery as the primary source of power. A single, fully-charged 100-ampere-hour battery enables a station to stay on the air continuously for 5 to 10 hours at the 10- to 20-ampere discharge rate demanded of the battery. For operation over longer periods than this, it is necessary to provide additional electric energy in the form of either more batteries or a self-powered battery charger. For mobile installations, charging is readily accomplished by the car generator. However, this method is not practical for stations operated in a fixed location,

construct the 6-volt 30-ampere charger.

The gasoline engine, generator and regulator were rigidly mounted on a simple wooden frame. The regulator, shown in the lower left-hand corner of the charger, is wired so as to use only the cut-out section of the unit; its only purpose here is to prevent a reverse flow of current at low engine speeds. At normal engine speeds, full power is supplied to the battery.

The drive mechanism utilizes the same system employed in the power mower. At low engine speeds, the automatic clutch on the engine drive shaft is disengaged and no power is supplied to the V belt. As the engine speed is increased,

Only a few hours are required to assemble this 30-ampere charger. If you happen to have a gasoline-powered lawnmower on hand and can dig up an old car generator and regulator, the cost is negligible.

such as is often encountered in Field Day and civilian defense assignments.

A self-powered charger was assembled at this location with a minimum of time and expense. The unit is lightweight (60 lbs.), potent (30 amp.), and is suitable for continuous operation over extended periods of time.

The 1-horsepower 4-cycle gasoline engine was borrowed from my reel-type power lawnmower, an excess car generator was donated by the brother-in-law, and a much-used regulator was supplied by an interested neighbor. The odds and ends of wood, wire and hardware, plus a d.c. ammeter, were supplied from my own junk box. A few hours' time was all that was needed to

centrifugal force causes the clutch to close, thus enabling the V belt to pick up the load.

Only four bolts hold the engine in place in either the charger or the power mower. Less than five minutes is required to switch the 32-pound engine from one assignment to the other. Those five minutes of time are the only price necessary to keep W7FVI on the air continuously for Field Day and disaster-team commitments.

# What's the Answer?

## A Question-and-Answer Quiz for the Beginner

BY LEWIS G. McCOY, WHICP

**I**N answering correspondence from amateurs around the country, it becomes apparent that certain questions repeat more than others. This would indicate that the same problems are shared by many beginners and that it would be helpful to have an article in *QST* discussing these problems. People seem to enjoy quizzes so we have listed the questions in bold-face type and, if you wish, you can try answering them before reading the explanations. If you get all the answers right it indicates that you have a pretty fair radio IQ for a beginner.

### 1. What causes key clicks?

There are two types of clicks. One is caused by electrical sparking at the key contacts. This is the same type of electrical noise you hear in your receiver when someone in the house turns on an electric light switch. Depending on the intensity of the spark generated and the associated wiring, the noise can cover quite a wide frequency range. The electrical noise from this sparking won't travel far—probably not more than a few hundred feet. However, it can cause interference to neighbors' radio reception, so the clicks should be eliminated. This type of click is easy to cure; a simple key-click filter (Fig. 1) at the key contacts will usually get rid of it.

The second type of click is that generated by the actual turning on and off of the transmitted signal. If the signal goes on or off too abruptly,

Fig. 1—Key-click filter.

a click will be generated. The clicks will be strongest close to the frequency of the transmitted signal but may extend far enough to cause interference across an amateur band. To get rid of this type of click it is necessary to "shape" the keying. The reader should study the keying chapter in *The Radio Amateur's Handbook*, as proper treatment of shaping procedure is beyond the scope of this article.

### 2. What causes chirp?

Chirp is a change in frequency as the transmitter is keyed. There are several possible causes for the frequency change. One is the voltage change on the oscillator stage from the key-up condition to key-down. This can be minimized by regulating the screen and plate voltages of the oscillator stage.

Another common cause of chirp is "pulling" of the oscillator frequency by changing conditions in the next stage or stages as the excitation is applied or removed. Changing voltages and currents in the stages following the oscillator "reflect" a variable load on the oscillator and pull the frequency. When such a condition exists it is necessary to have more or better isolation between the oscillator and the changing stage.

When persistent cases of chirp are encountered with several different crystals, one should look at the circuit adjustment. An overloaded oscillator can make any crystal chirp.

### 3. How far can one expect to work with a low-powered transmitter of say 5 or 10 watts input?

This is not an easy question to answer because of the many variables involved. It will depend a great deal on the location, type of antenna used, frequency, time of day and year, and band conditions. The condition of the ionosphere, the region above the earth that reflects radio signals, varies with the time of day, time of year, and the sunspot cycle. However, it would be safe to state that with a fair antenna, and exceptional band conditions, the transmitted signal from a 5- or 10-watt station can reach any country in the world. This holds true for any amateur band from 40 through 10 meters.

One amateur using approximately 35 watts input worked over 100 different countries on the 80-meter band. Many Novices have worked all 48 states using very low power.

### 4. What is the advantage in using the same antenna for transmitting and receiving?

Nearly all antennas will give better performance in certain directions than in others. To illustrate, let's assume we have a transmitting antenna that is good for transmitting in the east-west direction but is poor as far as north and south are concerned. Suppose we have another antenna, used for receiving, that shows good reception on the north-south path. We can call our heads off at stations on the north-south path but because our transmitted signal in this direction is weak, we get no replies. By using

the same antenna for transmitting and receiving, we eliminate this difficulty. It doesn't mean that everybody we call is going to come back but at least we know they *might* hear us. An antenna relay or knife switch can be used to switch the feeders to receiving or transmitting.

**5. When tuning the amplifier plate circuit, which indication is the correct setting for resonance as shown by the plate milliammeter, minimum or maximum current?**

The tuning setting that gives minimum plate current, or the "dip," is resonance in the plate circuit. Normally, the "dip" is the correct setting for getting maximum output from an amplifier. We say "normally" because in amplifiers using screen-grid tubes, maximum output may occur at a setting slightly different than the "dip." The safest method of tuning is to have an r.f. ammeter, or some similar indicating device, in the feed line and then tune the transmitter for maximum output as indicated by the r.f. ammeter. The final amplifier should not be loaded beyond the rated plate current of the tube in use.

**6. What does "crystal-controlled" mean?**

This means the frequency of the oscillator stage is determined by a quartz crystal. A crystal will only oscillate or vibrate at a certain frequency, depending on the dimensions and cut of quartz used in the crystal. Using a crystal-controlled oscillator is one method of making sure the transmitter frequency will be stable. In addition, the transmitter frequency will be accurately known.

The FCC requires that Novices use crystal control of their transmitters.

**7. What is a harmonic?**

A harmonic is a signal that is an integral multiple of the fundamental frequency. It is characteristic of certain types of r.f. generation that when we develop a fundamental signal, we also generate multiples of that frequency. For example, if we generate a signal on 3700 kilocycles, there will also be signals present at 7400 kc., 11,100 kc., 14,800 kc., etc. Normally, these harmonics will be weaker in strength as they go higher in frequency but in many cases they will be strong enough to cause interference to other services unless we do something to attenuate them.

**8. Why are filaments and heaters necessary in vacuum tubes?**

When an electric current is passed through the filament, the wire heats to incandescence.

In a vacuum, when the wire gets hot enough some of the electrons will fly off the filament and cluster around it. If another element is inserted in the tube and a voltage is applied between it and the filament (+ terminal to the new element), the electrons from the filament will flow to the added element.

The emitter of electrons in a vacuum tube is called the "cathode," and the filament described above is a "directly-heated cathode." Indirectly-heated cathodes are also widely used in vacuum tubes. Here a thin sleeve of metal is coated with a material that emits electrons at relatively low temperatures, and a small heater coil is contained within the sleeve. Indirectly-heated cathodes reduce hum problems in audio work that would be encountered with filament-type tubes.

**9. How does a rectifier tube act to change alternating current to direct current?**

As one can see from the explanation of Question No. 8, the filament or cathode of a tube emits electrons which flow to the positive plate element. If an a.c. voltage is applied between plate and cathode, one half of each cycle of the voltage will be positive, the other half negative. During the positive half cycle, electrons from the filament will flow to the plate. Current will not flow during the negative half cycle. This gives us a pulsating d.c. which can then be run through a filter to smooth out the ripple that will be present.

**10. How fast does a radio signal travel?**

Radio signals travel at the same speed as light waves, approximately 186,000 miles per second. In this connection, it is interesting to note that recently two amateurs beamed a signal at the moon and then listened for the reflected signal. The signal had to travel a distance of some 440,000 miles to get to the moon and back. With radio traveling at the speed of light, the distance would be covered in about 2½ seconds. You can imagine the thrill the two amateurs experienced when they sent the signal and then a couple of seconds later heard the faint "beep" of the returning signal.

**11. What is the relationship of the 80-meter band to the 3.5-megacycle band?**

They are the same. Probably one of the most confusing things the newcomer encounters is the reference to amateur bands by either meters or

(Continued on page 124)

# Lightning Protection for the Transmitting Antenna

## Grounded System for Open-Wire Feeders

BY R. C. CORDERMAN,\* W4ZG

**A**n old adage says lightning never strikes twice in the same place. You may not agree with this, but if it strikes you once it won't make any difference whether you do or don't agree.

Radio amateurs for the most part invite destruction by lightning by neglecting to provide any protection against it. The antenna usually associated with amateur radio transmitting equipment is most vulnerable to lightning due to its length and height. To validate your insurance, your antenna installation must comply with the National Board of Fire Underwriters Electrical Code which says:

*Lightning Arresters—Transmitting Stations.* Except where protected by a continuous metallic shield (coax) which is permanently and effectively grounded, or the antenna is permanently and effectively grounded, each conductor of a lead-in for outdoor antenna shall be provided with a lightning arrester or other suitable means which will drain static charges from the antenna system.

A similar requirement is applicable to a receiving antenna should it extend outside the

• Lightning protection for the amateur transmitting antenna, especially when open-wire feeders are used, has been largely neglected. W4ZG points out the dangers involved and offers some simple solutions.

ages can build up on an antenna due to other causes. About 1920, while attending Carnegie Tech, Pittsburgh, Penna., an experience was observed which will be of interest in this connection. The antenna at 8XC consisted of 10 wires 600 feet long, approximately 165 feet above the ground at its center. It ran across a gully, at the bottom of which was a mainline railroad track. When locomotives pulling heavy trains passed under the antenna, the static charge built up was sufficient to cause flash-over of an 8-inch gap. The flash repeated approximately every five

Fig. 1—A simple lightning arrester made from three stand-off or feed-through insulators and sections of  $\frac{1}{8}$ -inch-thick brass or copper bar.

building in which the receiving equipment is located.

Many years ago my antenna was struck by lightning. At that time, there was an insurance requirement which said that a 100-ampere switch should be used for grounding the antenna when the station was not in operation. The lightning completely destroyed most of the antenna wire, burned the wooden base of the lightning switch and burned the insulation off the No. 4 copper grounding wire between the switch and the ground stake. As the switch was in the grounded position, no damage to the house or radio equipment resulted.

Without adequate grounding, hazardous volt-

\* 792 Oaklawn Ave., Winston-Salem, N. C.

seconds while the engine was immediately beneath the antenna and less frequently when it was approaching or leaving the area below the antenna.

### Lightning Arresters

What steps should we take to protect ourselves and our equipment against these hazards? You will observe that the Electrical Code specifies that the lead-in may be a coaxial cable, the shield of which is permanently and effectively grounded. This means that a ground connection, using No. 4 wire or larger, should be made to the shield of the coaxial cable at the point where it is nearest to the ground outside of the house. If the cable can be run underground, a grounding

stake should be located at the point where the cable enters the ground. The grounding stake, to be effective in soils of average conductivity, should be not less than 10 feet long, and if possible, plated with a metal which will not corrode in the local soil.

When open-wire feeders are used, a lightning arrester is required. The type of lightning arresters provided for residential broadcast and television antennas may be suitable for very

twelve years these gaps were in use there was never an occasion when a lightning hit came closer to our house than a half block when a neighbor's house was struck. This could have been a happenstance but it is the fact, nevertheless. In the Pennsylvania Dutch country around Lancaster and York, most barns nowadays are protected from lightning by a length of old trolley wire mounted on poles extending about 10 feet above the roof. Both ends of the wire

Fig. 2 — Sketch of coax-fed grounded Zepp antenna. Adjustment is discussed in the text.

low-power installations but where higher power is used, they are inadequate, since the radio-frequency voltage on the transmission line is usually enough to cause them to operate; i.e., flash over.

During the early Thirties, advice was obtained from the Naval Research Laboratory at Washington, D. C., on a suitable grounding arrangement for lightning protection for a 1-kw. installation. It was their suggestion that a spark gap be provided between each of the two open-wire feeders and a center contact, grounded with No. 4 or larger wire. It was recommended that  $\frac{1}{8} \times \frac{1}{2}$ -inch flat brass rod shaped as shown in Fig. 1 be used for the gaps. Each of the gaps should be set sufficiently far apart so as to prevent flash-over during normal operation of the transmitter. It was found that because of the standing waves on the open-wire line a gap of approximately  $\frac{3}{16}$  inch was necessary.

This device worked very well during thunderstorms as it would start sparking intermittently when a storm was approaching. As the storms passed over the immediate area, the frequency of discharge would increase. During heavy thunderstorms, there was a steady stream of sparks at the gaps. It was possible to operate the transmitter with relatively little effect on its performance even while the static charges were jumping across the equipment, but this was seldom done because of a personal reluctance to be so close to the antenna system. It has been my belief that a properly installed spark gap on an antenna system drains off sufficient static from the immediate area to prevent a direct hit. This view stems from that fact that during the

are grounded and, so far as can be learned, no barn so protected has suffered lightning damage.

#### Direct Ground Connection

Many of our modern antennas permit relatively simple methods of direct ground connection, which do not interfere with the operation of the antenna. Rotary beams using a T or gamma match may have the center of each of the elements, including directors and reflectors, grounded to the tower on which they are mounted. Two- and six-meter beams should have the supporting pole grounded. If the antenna is mounted on a wooden pole or on the top of a house, a No. 4 or larger wire should be extended from the beam to the ground, using insulators where the wire comes close to the building. The ground wire should be spaced away from metal objects such as gutters, etc., or should be solidly grounded to them. If the connection to such objects is not a good one, but is variable in resistance, it may be a source of spurious signals when excited by the transmitter. This often results in interference with your own or your neighbors' broadcast or television reception.

For the past seven years, the antenna shown in Fig. 2 has been used at W4ZG, Winston-Salem, N. C. It gives what appears to be good lightning protection. It hasn't been hit yet. And best of all, signal reports have been more than satisfactory on power comparisons made with other stations under like conditions.

The antenna may properly be called an end-fed Zepp. Since much of the work done here is on the Tar Heel Net frequency of 3865 kc., the

# Happenings of the Month

## ENGWICHT NEW DIRECTOR

Because of a change of employment, Ray H. Cornell, W6JZ, recently became ineligible to continue as a director of the League from the Pacific Division. In accordance with Article 8 of the Articles of Association, the Vice-Director, **Harry M. Engwicht, W6HC**, was thereupon proclaimed director for the remainder of the term expiring at the end of this year. As notice of the change was too late to permit Mr. Engwicht to attend the meeting of the Board of Directors in Hartford May 13th-14th, Mr. Cornell represented the views of the Pacific Division, although necessarily without vote. In its review of the matter, the Board of Directors set March 14, 1955, the date of change of employment, as the effective date of Director Engwicht's office.

## 7-MC. NOVICE SEGMENT EXPANDED

Three years ago when the Federal Communications Commission proposed a new 7-Mc. band segment of 7175-7200 kc. for Novice use, the League's Board of Directors heartily endorsed the idea but urged that the segment be 50 kc. in width. FCC ruled against the larger band, at the time, suggesting that operating experience with the smaller assignment should be acquired first. At its 1954 meeting the Board found itself precisely of the same opinion as earlier, and voted to recommend an expansion to 7150-7200 kc.; the Commission has now concluded rule-making proceedings in the matter and effective June 22nd amended our rules to authorize the full 50 kc. for Novice use.

## R.E.T.M.A. AMATEUR COURSE

Through its Amateur Radio Activities Section, the Radio-Electronics-Television Manufacturers Association has produced a text-and-records course in theory and code instruction aimed at the Novice Class amateur license. The primary interest of the industry association lies neither in the sale of this item, since it is non-profit, nor in sales of amateur equipment, but rather in urging that more people take up amateur radio as a steppingstone to a career — the objective being to make additional trained personnel available to meet the needs of the expanding electronics field. RETMA suggests that its course will have particular interest for civil defense training programs, amateur radio clubs, hobby groups, schools and personnel in all branches of the military service.

The course consists of an illustrated text on basic theory, equipment operation, etc.; an ARRL *License Manual*; and five LP records of code instruction. Its price is approximately

\$10; the course may be secured from RETMA, 777 14th St., N.W., Washington 5, D. C. A brochure describing the course is available free of charge upon request.

## "LMS" 25TH

The transcribing initials which, in the past, appeared on countless thousands of letters and bulletins from Hq., far more often than any other, are LMS — which as practically every ham in Christendom knows stands for Lillian M. Salter, currently Administrative Aide in the ARRL Communications Department. On May 12th, "Lil" marked 25 years on the staff —

WIZJE

being the seventh Hq. member to attain that length of service.

Miss Salter probably knows more about the day-to-day operation of the CD than anyone else. She is the link between policy and practical accomplishment. Employed originally as a stenographer, she soon acquired administrative duties: processing and editing section reports, supervision of SCM appointments and appointee records, field-organization supplies, club affiliations and records, to name a few. She still personally handles the master stencils for the numerous CD bulletins to appointees and clubs. During World War II, with the title of Assistant Communications Manager, she provided an important continuity in the department through a succession of acting communications managers in Mr. Handy's absence on military duty.

Lil Salter managed for over twenty years to keep from becoming a ham, but a surge of enthusiasm for the Novice license a couple of years ago caught her, too; she quickly graduated to General Class, and is now W1ZJE. Don't look for her on the air around the middle of each month, however; it's "copy time" for QST section reports, and evening hamming must be foregone for overtime work in their editing and processing. That is typical of LMS — as loyal and as conscientious and as devoted a worker for amateur radio and the League as has ever graced the Hq. staff.

## LICENSE PLATE ACTIVITY

Amateurs in several states have been actively promoting the issuance of call-letter license plates, and the governors of four states and the Territory of Hawaii have recently signed into law the coveted legislation. Thirty-one states now offer this privilege and Headquarters continues to provide information on the subject to individuals or clubs.

In Utah, W7NVY was appointed to head the committee which saw its efforts to a successful conclusion on March 11th, when the Governor put his name to the bill. Maryland amateurs W3EQK and W3PRL were instrumental in their state in having Governor McKeldin sign into law, on April 25th, a bill which authorizes plates for mobile amateurs. Meanwhile, in Pennsylvania, W3s BN QV YA ADF EOZ RSB TBV and VZJ organized a drive that put them over the top on May 3rd when Governor Leader made HB 561 into law. Hawaii joined with the Canal Zone and Alaska on May 5th when the Governor signed Act 67. Sparked by W9EU, W9BHT, W9PVD, and W9UQT, in Illinois, Governor Stratton signed the new law on May 11th; it took three years to get this act through, and a committee of more than thirty coordinated the complete coverage that spelled success in their state. On May 26th Connecticut became the latest State to join the parade when Governor Ribicoff signed SB 23 into law.

## EXAMINATION SCHEDULE

The Federal Communications Commission will give Extra and General Class amateur examinations during the second half of 1955 on the following schedule. Remember this list when you need to know when and where examinations will occur. Where exact dates or places are not shown below, information may be obtained, as the date approaches, from the Engineer-in-Charge of the district. *Even stated dates are tentative and should be verified from the Engineer as the date approaches.* No examinations are given on legal holidays. All examinations begin promptly at 9 A.M. except as noted. (Novice, Technician and Conditional exams are given only by mail. See page 50, May 1954 QST, or the *License Manual* for details.)

**MINUTES OF 1955 SPECIAL MEETING OF THE  
 BOARD OF DIRECTORS  
 AMERICAN RADIO RELAY LEAGUE  
 May 13-14, 1955**

1) Pursuant to due notice, the Board of Directors of The American Radio Relay League, Inc., met in special session at the Statler Hotel, Hartford, Connecticut, on May 13, 1955. The meeting was called to order at 9:37 A.M. EDT, with President Goodwin L. Dosland in the Chair and the following directors present:

P. Lanier Anderson, Jr., Roanoke Division  
 James P. Born, Jr., Southeastern Division  
 John H. Brabb, Great Lakes Division  
 George V. Cooke, Jr., Hudson Division  
 Robert E. Cowan, West Gulf Division  
 Gilbert L. Crossley, Atlantic Division  
 Alfred M. Gowan, Dakota Division  
 Walter R. Joos, Southwestern Division  
 Claude M. Maer, Jr., Rocky Mountain Division  
 Harry M. Matthews, Central Division  
 Philip S. Rand, New England Division  
 Alex Reid, Canadian Division  
 R. Rex Roberts, Northwestern Division  
 William J. Schmidt, Midwest Division  
 George H. Steed, Delta Division

Absent: Director Harry M. Engwicht, Pacific Division. Also in attendance as members of the Board, without vote, were Wayland M. Groves, First Vice President; F. E. Handy, Vice President; Percy C. Noble, Vice President; A. L. Budlong, General Manager. Also in attendance, at

the invitation of the Board as non-participating observers, were New England Division Vice-Director Clayton C. Gordon and Central Division Vice-Director George E. Keith. There were also present Treasurer David H. Houghton, Technical Director George Grammer, Assistant Secretary John Huntoon, and Quayle B. Smith of the General Counsel's office.

2) On request of the President, Vice President Groves assumed the Chair. Whereupon, on motion of Mr. Dosland, the following resolution was unanimously ADOPTED, by rising vote (applause):

WHEREAS, on January 1, 1955, Alex Reid, VE2BE, completed 25 years of continuous service as a member of the Board of Directors of The American Radio Relay League, Inc., representing the League members in Canada, and

WHEREAS, his fellow directors on the Board are mindful of the benefits which have accrued to the Board as the result of his long experience and wise counsel, and WHEREAS, it is their desire to make known to Alex Reid their deep affection for him as a respected associate and beloved fellow-amateur, and

WHEREAS, the Board wishes to express to him its sincere best wishes for his continued success and happiness for many years to come

Now, therefore, BE IT RESOLVED, that the Board of Directors, meeting in Hartford, Connecticut, on May 13, 1955, in recognition of Alex Reid's untiring efforts on behalf of the League, does hereby express to him its congratulations and deep appreciation of his quarter century of loyal and intelligent devotion to the best interests of amateur radio and the League.

Whereupon, Mr. Dosland resumed the Chair. Mr. Reid spoke briefly in appreciation.

3) Moved, by Mr. Born, that the Board invites Ray H. Cornell, of the Pacific Division, to attend this meeting as an observer, with the right to participate in discussions, but without the right to vote; and further that the Board authorizes reimbursement of the expenses incidental to his attendance. Moved, by Mr. Maer, to amend the motion to add "and that the Board ratifies the action of the officers of the League in this matter." Moved, by Mr. Brabb, further to amend the motion to add the words "and that all Board members are instructed to review the matter of their eligibility to serve and to resign should they find themselves ineligible by reason of their employment"; but, after discussion, Mr. Brabb withdrew the motion to amend. The question then being on the original amendment, the same was unanimously ADOPTED. (At this point, Atlantic Division Vice Director Charles O. Badgett, General Counsel Paul M. Segal, and Ray H. Cornell, of the Pacific Division, entered the meeting.) Unanimous consent being given, Mr. Cornell discussed the circumstances resulting in his vacating the office of director for the Pacific Division. After further extended discussion, during which the Board heard from its General Counsel, on motion of Mr. Brabb, unanimously VOTED to amend the motion by striking the text of the previous amendment and substituting therefor the following: "And that this Board finds that the Pacific Division Director, by entering in the employ of a firm engaged in the manufacture, sale or rental of radio apparatus on March 14, 1955, thereby effected his resignation as a director on that date." The question then being on the motion as amended, the same was unanimously ADOPTED.

4) On motion of Mr. Roberts, unanimously VOTED that the minutes of the 1954 special meeting of the Board of Directors are approved in the form in which they were issued by the Secretary.

5) On motion of Mr. Born, unanimously VOTED that the minutes of the 1955 annual meeting of the Board of Directors are approved in the form in which they were issued by the Secretary.

6) On motion of Mr. Gowan, unanimously VOTED that the annual reports of the officers to the Board of Directors are accepted and the same placed on file.

7) Mr. Roberts presented the report of the Finance Committee; Mr. Brabb presented the report of the Planning Committee; Mr. Cooke reported briefly for the Membership & Publications Committee; Mr. Dosland reported briefly for the Public Relations Committee; Mr. Reid presented the report of the Merit Award Committee. Whereupon, without objection, ORDERED that these reports be received and placed on file. Without objection, ORDERED that the report of the Committee for the Handicapped be deferred for consideration later in the meeting.

**ARE YOU LICENSED?**

• When joining the League or renewing your membership, it is important that you show whether you have an amateur license, either station or operator. Please state your call and/or the class of operator license held, that we may verify your classification.

8) On motion of Mr. Crossley, unanimously VOTED that the annual reports of the directors to the Board of Directors are accepted and the same placed on file.

9) At this point, supplementary oral reports were rendered by the officers of the League.

10) The Board was in recess from 11:48 A.M. until 11:51 A.M.

11) Moved, by Mr. Brabb, that the Executive Committee, together with the General Counsel, comprise a standing committee for the purpose of determining eligibility of nominees for elective offices and that all rulings of eligibility shall be concurred in by such standing committee; but, unanimous consent being given, Mr. Brabb withdrew the motion.

12) Moved, by Mr. Brabb, that the General Manager investigate the possibility and practicability of publishing a small handbook on the construction and use of test instruments. Moved, by Mr. Rand, that the motion be amended by striking the text and substituting thereof the following: "That the Board express approval of the present policy of the General Manager in the publication of additional books such as 'Single Sideband for the Radio Amateur' and the proposed mobile booklet, and that he continue to explore this field;" but, RULED, by the Chair, that the motion to amend was out of order as not being germane. Whereupon, the question being on the original motion, the same was unanimously ADOPTED.

13) Moved, by Mr. Brabb, that the Technical Department be instructed to investigate and report to the General Manager the feasibility of increasing the scope of the Novice examination in order to insure such licensee's ability to adjust and operate his radio equipment in accordance with current regulations. Moved, by Mr. Cooke, to amend the motion to include a study of the possibility of adding questions on television interference; but there was no second, so the motion to amend was lost. Whereupon, the question being on the original motion, the same was unanimously ADOPTED.

14) Moved, by Mr. Cooke, that there be established a new League official appointment to be called Public Relations Manager, or PRM, to enable the League to draw upon professional public relations and publicity talent within the radio amateur ranks in order that the League and amateur radio generally be more effectively represented to the public. This appointment to be made by Section Communications Managers, but only within rigid requirements

which will insure that PRM appointees have at least one year of professional experience in publicity, public relations or newspaper editorial work, appointed for Section, county and local jurisdiction in similar manner to present EC appointments. The PRM duties shall be to cultivate good amateur relations with the public through publicity and cooperative efforts with other groups, act as a local "Amateur Radio Information Bureau," serve as local outlets for public statements giving local angles to press releases at Headquarters and for public statements aimed at furthering League policies, and that this post be left open by SCMs rather than unqualified personnel be appointed. On motion of Mr. Maer, unanimously VOTED to amend the motion to provide that the Communications Manager is requested to initiate a study of the establishment of such an appointment and report the results of his study at the next meeting of the Board. Whereupon, the question being on the motion as amended, the same was unanimously ADOPTED.

15) The Board was in recess for lunch from 12:28 P.M. until 2:07 P.M.

16) Moved, by Mr. Cooke, that the General Manager be instructed to petition the FCC to revise Part 12.107 (c) and (d) of the Rules Governing Amateur Radio Service, titled "Special Provisions Regarding Radio Teleprinter Transmissions," to permit any shift under 900 cycles while still permitting standard intercommunication with 850 cycle shift as at present incorporated in the Rules. On motion of Mr. Crossley, VOTED to amend the motion by stating that the General Manager is instructed to investigate the feasibility of acting in this manner and, if found feasible, to so petition the Commission to amend. The question then being on the motion as amended, the same was unanimously ADOPTED.

17) On motion of Mr. Rand, unanimously VOTED that the Board congratulates the Headquarters staff for a job well done during the past year.

18) On motion of Mr. Rand, the following resolution was unanimously ADOPTED:

WHEREAS, on March 6, 1955, C. Vernon Chambers completed 25 years of continuous service to The American Radio Relay League as Technical Assistant, QST,

BE IT RESOLVED, that the Board of Directors, meeting in Hartford, Connecticut, on May 13, 1955, in recognition of C. Vernon Chambers' untiring efforts on behalf of the League, does hereby express its deep ap-

The ARRL Board of Directors and League officials at a luncheon recess during the meeting in Hartford on May 13th. Seated, l. to r.: Southwestern Director Joos; Ray H. Cornell, W6JZ, of the Pacific Division; First Vice-President Groves; Northwestern Director Roberts; Midwest Director Schmidt; Vice-President and Communications Manager Handy; Counsel Quayle B. Smith; President Dosland; Secretary and General Manager Budlong; Asst. Secretary Huntoon; Treasurer Houghton; Canadian Director Reid; Vice-President Noble; New England Director Rand; Rocky Mountain Director Maer. Standing, l. to r.: West Gulf Director Cowan; Technical Director Grammer; New England Vice-Director Gordon; Great Lakes Director Brabb; Southeastern Director Born; Dakota Director Gowan; Roanoke Director Anderson; Central Director Matthews; Central Vice-Director Keith; Hudson Director Cooke; Atlantic Vice-Director Badgett; Atlantic Director Crossley. Absent from photo: Delta Director Steed, General Counsel Segal.

preciation of his loyalty, fidelity, and intelligent devotion to the best interests of amateur radio.

19) Moved, by Mr. Rand, that the Board review Items 10, 14, 17, 19, 24, 27, 29, 33, 34, 50, 69, 71, 82, 86 of the minutes of the 1954 Special Meeting of May 14 & 15th to determine whether or not the instructions therein contained were carried out; but, with the consent of his second, Mr. Rand withdrew the motion. Whereupon, the General Manager, in a supplementary report to his earlier oral report, reviewed the action taken with respect to the listed items.

20) Moved, by Mr. Rand, that the Board direct the Editor of *QST* to publish the results of the New England Director's questionnaire in an early issue of *QST*; but there was no second, so the motion was lost.

21) Moved, by Mr. Rand, that the Board instruct the General Manager to use his every effort to have the RACES program made a permanent, instead of a temporary, agency; but there was no second, so the motion was lost.

22) Moved, by Mr. Rand, that the Board instruct the Editor of *QST* to place the primary emphasis on RACES and only secondary emphasis on AREC and to provide ample space each month in *QST* for publishing material on RACES. On motion of Mr. Maer, unanimously VOTED to amend the motion by striking the text and substituting therefor that the Board instruct the Editor of *QST* to continue to emphasize RACES and AREC and to provide ample space in *QST* for publishing material on these activities and to continue efforts to stimulate these activities. Whereupon, the question being on the motion as amended, the same was rejected.

23) Moved, by Mr. Rand, that the Board take immediate and definite steps to raise the overall quality of operating procedures and equipment used on the amateur bands by the following means:

- A. Establish an up-to-date code of ethics for operators.
- B. Establish a minimum set of specs for Ham equipment.
- C. Give all out publicity through *QST*.
- D. Establish a new "Honor Society" for those meeting requirements.
- E. Publish Official Observers reports on bad operating and bad signals in *QST*.
- F. Feature articles in *QST* on both phone and c.w. equipment which will help insure clean signals.
- G. Conduct a contest each year which will feature operators and stations adhering to the new code.
- H. Appropriate sufficient funds to finance this program.

Moved, by Mr. Roberts, to amend the motion to provide that the Planning Committee shall study the matter; but the motion to amend was rejected. The question then being on the original motion, the same was unanimously rejected.

24) Moved, by Mr. Rand, that the Board direct the Planning Committee to study a method of promoting diversification of operating and use of bands by establishing an annual award for the "Typical Ham" of the year in each Division. This award to be suitable loving cup or trophy; but there was no second, so the motion was lost.

25) Moved, by Mr. Rand, that the General Manager be instructed to modify the publication of the ARRL Radio Amateur's Handbook so that the "how to build it" equipment section will be all new every two years, instead of the present every three years; but there was no second, so the motion was lost.

26) Moved, by Mr. Anderson, that the General Manager investigate the establishment of appropriate awards for mobile operation — both as to physical size and merit requirements. Moved, by Mr. Brabb, to amend the motion so that the Merit Award Committee would investigate the establishment of such an award; but there was no second, so the motion to amend was lost. The question then being on the original motion, the same was rejected.

27) On motion of Mr. Anderson, VOTED, that it be the policy of the Board that each director of the League shall send to all other directors a copy of all bulletins, news letters, questionnaires, etc. he originates in his own division.

28) The Board was in recess from 4:00 P.M. until 4:13 P.M.

29) On motion of Mr. Crossley (on behalf of Mr. Cornell), unanimously VOTED that the Board instruct the Secretary in the name of ARRL to continue to seek a change in the Rules Governing Amateur Service, Part 12, Section 12.111 (5) (k) as it pertains to 420-450 Mc. operation, so that the power limit be removed.

30) Moved, by Mr. Born (on behalf of Mr. Cornell), that the Planning Committee be instructed to work out a practical solution to the matter of mobile log keeping and that it be abolished, or kept to a minimum. It is suggested that as a basis of consideration, that if log keeping by mobile stations cannot be abolished entirely that a "Trip Sheet" log be kept, recording time of starting and ending a trip — route covered, frequency and mode of operation. But the motion was rejected, 4 votes in favor to 7 opposed.

31) Moved, by Mr. Joos (on behalf of Mr. Cornell), that to implement and modernize the DX Section of the ARRL, an unpaid committee be set up, whose recommendations, arrived at by joint agreement of a committee two thirds majority, be carefully considered by the ARRL in its DX policies, particularly as to the following: a) DX contest rules; b) DX country list; c) DX awards. This committee to consist of one member from each of the ten highest scoring clubs in the official ARRL DX contest tabulations annually, club committee membership to begin each year on January first following the publication of the official club scores in *QST*, plus any other important DX group or individual deemed helpful by the ARRL. No committee membership to be longer than one year unless the same club is qualified in each succeeding year by its official score remaining among the top ten. Representative member to be selected by each club from among its members. All communication between the committee members and between the committee and the ARRL to be by means of correspondence. Nothing in this proposal shall preclude any individual or club from making proposals either to the ARRL direct or to the committee for approval if considered of merit. Moved, by Mr. Brabb, that the Board now constitute itself a Committee of the Whole for the purpose of considering this matter; but there was no second, so the motion was lost. On motion of Mr. Brabb, unanimously VOTED that the matter is laid on the table.

32) On motion of Mr. Maer, after extended discussion, unanimously VOTED that the salary of the General Manager is increased, effective this date, to \$18,000 per annum. (Mr. Maer requested that the minutes show that all Headquarters personnel in attendance, some of whom are members of the Board, requested leave to absent themselves from the meeting during the discussion of salaries and so absented themselves.) During the absence of Secretary Budlong, in the discussion of this matter, the Chair appointed Quayle B. Smith to record the proceedings of the meeting.

33) Moved, by Mr. Joos, that the General Manager investigate the feasibility of a questionnaire similar to that recently sent out by the New England Division Director to all League members for information purposes; but the motion was rejected.

34) Moved, by Mr. Joos, that the Board instruct the General Manager to print in *QST* quarterly a simple earnings and balance sheet; but there was no second, so the motion was lost.

35) Moved, by Mr. Crossley, that the League, through its General Manager, request the Federal Communications Commission to make a restriction in the 2-meter band (144-148 Mc.). That c.w. operation be restricted to the lowest 100 kc. of the band. But there was no second, so the motion was lost.

36) Moved, by Mr. Crossley, that the Secretary hereafter shall give informal notice to the directors that, on (date) the official notice for the special meeting of the Board will be made. That, if there are any matters which relate to the Articles of Association, notice of these changes must be filed with the Secretary, in his office at West Hartford before that time to be legally included in the Call for the Special Meeting. But there was no second, so the motion was lost.

37) The Board was in recess for dinner from 6:16 P.M. until 8:47 P.M.

38) Moved, by Mr. Crossley, that the Board instruct the General Manager of ARRL to write, edit, and publish a Novice Technical Handbook or Manual, which shall include the fundamentals of electricity and radio, as applied to the level of technical knowledge of the Novice amateur so that he may advance to be better able to read and understand the higher level Handbook; but, after discussion, the motion was rejected.

39) Moved, by Mr. Crossley, that the Board establish a "Student Grade" of ARRL membership much like the similar grade established by the Engineering Societies.

This membership to be available to high school students and others who at the time of application for membership shall not have reached their nineteenth birthday. This membership shall be limited to not longer than three years and the applicant must be a licensed amateur of Novice grade or higher. This grade of membership shall be at the rate of \$2.00 per year, and cannot be used in connection with the family or affiliated club rates. Eligibility to the full membership, of course, is not to be denied, if eligible, but while a Student Grade the member shall have no voting

## BOARD THANKS VOLUNTEER A.R.R.L. OFFICIALS

In reviewing the work of the League for the past year the ARRL Board of Directors again found that much of our progress is due to the volunteer efforts of elected and appointed officials in the administrative and field organization of our association. By unanimous action the Board has again expressed its sincere thanks to the Vice-Directors, director assistants, SCMs, SECs and QSL Managers — an action which we know all amateurs will heartily endorse.

rights in ARRL or Affiliated Clubs. But there was no second, so the motion was lost.

40) On motion of Mr. Groves, the following resolution was unanimously ADOPTED by rising vote (applause):

WHEREAS, on August 26, 1954, George Grammer completed 25 years of continuous service to The American Radio Relay League as Technical Director and Technical Editor of QST,

BE IT RESOLVED, that the Board of Directors, meeting in Hartford, Connecticut, on May 13, 1955, in recognition of George Grammer's untiring efforts on behalf of the League, does hereby express its deep appreciation of his loyalty, fidelity, and intelligent devotion to the best interests of amateur radio.

41) On motion of Mr. Roberts, unanimously VOTED that the General Manager is hereby authorized to reimburse the division directors for actual expenses incurred by them during the year 1955 in the proper administration of ARRL affairs in their respective divisions up to amounts as follows:

Canadian Division Director.....	\$ 550
Atlantic Division Director.....	1250
Central Division Director.....	1000
Dakota Division Director.....	700
Delta Division Director.....	900
Great Lakes Division Director.....	800
Hudson Division Director.....	900
Midwest Division Director.....	900
New England Division Director.....	1000
Northwestern Division Director.....	1000
Pacific Division Director.....	1200
Roanoke Division Director.....	600
Rocky Mountain Division Director.....	700
Southeastern Division Director.....	1200
Southwestern Division Director.....	1200
West Gulf Division Director.....	1000

42) On motion of Mr. Schmidt, unanimously VOTED that the General Manager is hereby authorized to pay expenses for the operation of ARRL committees during the year 1955, but not to exceed amounts as follows:

Planning Committee.....	\$2000
Finance Committee.....	1500
Merit Award Committee.....	250

43) On motion of Mr. Gowan, unanimously VOTED that the General Manager is hereby authorized to reimburse, in the continental limits of the United States and Canada proper, the Section Communications Managers and QSL Managers of the League, in a total amount not to exceed \$5000 for the year 1955, under the provisions

and conditions set up in paragraph (52) of the minutes of the 1953 Special Meeting of the Board of Directors. For the purpose of defraying incidental costs such as the necessary meals or one night in a hotel, if a meeting is over 50 miles from the SCMs home, or highway tolls involved, for example, reimbursement in excess of mileage may be made in a reasonable amount per SCM organization meeting, this to be approved by the Communications Manager, provided that each miscellaneous expenditure be itemized and submitted with the travel claim.

44) On motion of Mr. Brabb, unanimously VOTED that as part of the 1955 SCM/QSL Manager authorization, the General Manager is also authorized to reimburse the SCMs of Alaska, Canal Zone, Hawaii and the West Indies their actual travel expense for attendance, each within his own Section, at major or considerable group meetings where time is scheduled for promotion of League operating organization at Section level. Hamfests may be included only where sponsor schedules such ARRL Section meeting in advance. Travel allowance for shortest feasible route shall, in addition to actual rail or bus fare, or 7½¢ per mile if SCMs personal transportation is used, be subject to approval by the Communications Manager of a report submitted with the itemized request for reimbursement. This report shall cover attendance, representation of ARRL, meeting discussions, recommendations and progress. When such meeting is over 50 miles from the SCMs address, reasonable incidental costs such as necessary meals, or one night in a hotel not to exceed \$7, for example, may be itemized and also submitted for approval as part of the travel claim. No specific limit is set to the number of trips in the Sections that are reimbursable, but in lieu thereof, an applicable limit of \$150 per annum is hereby established as the maximum that may be reimbursed to each SCM under this authorization.

45) On motion of Mr. Born, unanimously VOTED that to continue the Board's policy of reimbursing Section Emergency Coordinators for certain travel, the General Manager is hereby authorized to pay during the year 1955 a total amount not to exceed \$3500 under the provisions and conditions specified in paragraph (58) of the minutes of the 1952 Special Meeting of the Board of Directors. For the purpose of defraying incidental costs such as necessary meals or one night in a hotel if a meeting is over 50 miles from the SECs home, or highway tolls involved, for example, reimbursement in excess of mileage may be made in a reasonable amount per SEC organization meeting, this to be approved by the Communications Manager, provided that each miscellaneous expenditure must, to be reimbursed, be itemized and submitted with the travel claim. In the case of the SECs of Alaska, Canal Zone, Hawaii and the West Indies, no specific provisions as to the number of trips reimbursed shall apply but reimbursements will otherwise be guided by customary provisions, with the applicable limit of \$150 per annum as a maximum that may be reimbursed to each such SEC under this authorization.

46) On motion of Mr. Crossley, unanimously VOTED that the General Manager is hereby authorized to pay, during the period between January 1, 1956 and the 1956 meeting of the Board, expenses against usual authorizations for administrative and committee operations in no greater amounts than 1955 authorized amounts.

47) On motion of Mr. Roberts, unanimously VOTED that, pursuant to the terms of the Trust Agreement under the Pension Plan, the following persons are appointed to serve as a Pension Committee from June 2, 1955 to June 2, 1956: Arthur L. Budlong, George Grammer, and David H. Houghton.

48) On motion of Mr. Noble, the following resolution was unanimously ADOPTED:

WHEREAS, on May 12, 1955, Lillian M. Salter completed 25 years of continuous service to The American Radio Relay League as Communications Department Administrative Aide,

BE IT RESOLVED, that the Board of Directors, meeting in Hartford, Connecticut on May 13, 1955, in recognition of Lillian M. Salter's untiring efforts on behalf of the League, does hereby express its deep appreciation of her loyalty, fidelity, and intelligent devotion to the best interests of amateur radio.

49) On motion of Mr. Brabb, unanimously VOTED that the Board go on record as commending the Field Engineering and Monitoring Bureau of the Federal Com-

munications Commission for its assistance and cooperation rendered amateurs over the past year.

50) On motion of Mr. Born, unanimously VOTED that the Board hereby expresses its sincere thanks and deep appreciation for the untiring work and devotion of the Vice Directors, director assistants, SCMs, SECs and QSL Managers of the League.

51) Mr. Maer reported for the Committee for the Physically Handicapped; whereupon, without objection, the Chair ordered that the report be received and placed on file.

52) On motion of Mr. Schmidt, affiliation was unanimously GRANTED to the following radio clubs:

Peoria-Area Amateur Radio Club...	Peoria, Illinois
Tri-County Radio Club.....	Dresden, Tenn.
Mansfield Amateur Radio Club...	Mansfield, La.
Kaw-Blue Radio Club.....	Manhattan, Kans.
Fairfield High School Amateur Radio Club.....	Fairfield, Iowa
Luther College Amateur Radio Club.....	Decorah, Iowa
Yampa Valley Radio Club.....	Craig, Colorado
Penn. Central Radio Club.....	Falls Creek, Penna.
Watertown Radio Club.....	Watertown, N. Y.

53) On motion of Mr. Cooke, the following resolution was unanimously ADOPTED:

WHEREAS, the radio amateurs of the United States, its possessions, and Canada are aware of the cooperative actions taken by IARU Societies and their memberships in many international competitions, and

WHEREAS, these same IARU Societies have contributed to the advancement of peaceful international relations by the exchange of amateur radio communications between themselves, the United States, its possessions, and Canada,

BE IT RESOLVED, that the Board of Directors and the Staff of The American Radio Relay League extending their hands in friendly greeting to all IARU Societies, demonstrate their appreciation and faith, created by such operations, in international harmony and the advancement of amateur radio worldwide for the good of all peoples, and

BE IT FURTHER RESOLVED, that the President of the ARRL convey to all IARU Societies a copy of this resolution together with his letter of greeting and appreciation.

54) On motion of Mr. Rand, at 9:54 P.M., the Board recessed under orders to reassemble at 8:30 A.M. on the morrow. The Board reassembled at the same place on May 14, 1955, and was called to order by the Chair at 8:42 A.M. with all directors and other persons hereinbefore mentioned in attendance, except Mr. Engwicht.

55) Moved, by Mr. Rand, that pursuant to Article 7 of the Articles of Association, Percy C. Noble is designated and appointed a member of the Executive Committee. Moved, by Mr. Matthews, to amend the motion to throw the appointment open to election, and to include the name of John H. Brabb as a candidate. Moved, by Mr. Cooke, to further amend the motion to include the name of R. Rex Roberts as a candidate; but Mr. Roberts withdrew his name. The question being on Mr. Matthews' amendment, the same was ADOPTED. The question then being on the motion as amended, the same was unanimously ADOPTED. The Chair appointed Messrs. Rand and Groves as tellers. The tellers announced the result of the first ballot as follows: Mr. Noble, 9; Mr. Brabb, 6. The Chair thereupon declared Mr. Noble designated and appointed as a member of the Executive Committee.

56) Mr. Maer moved the adoption of the following resolution:

BE IT RESOLVED that, pursuant to Article 7 of the Articles of Association, R. Rex Roberts is hereby designated and appointed a member of the Executive Committee, to serve as such for the period ending May 15, 1956, and

BE IT RESOLVED that, pursuant to Article 7 of the Articles of Association, F. E. Handy is hereby designated and appointed a member of the Executive Committee, to serve as such for the period ending May 15, 1956, and

BE IT RESOLVED that, pursuant to Article 7 of the Articles of Association, David H. Houghton is hereby designated and appointed a member of the Executive Committee, to serve as such for the period ending May 15, 1956.

The yeas and nays being ordered, upon request, the ques-

## OFFICERS' REPORTS AVAILABLE TO MEMBERS

Each year the officers of the League make comprehensive written reports to the directors. The Board has made these reports available to interested members, in a volume which also includes reports of the directors. The cost price is 75 cents per copy, postpaid. Address the General Manager at West Hartford, Conn.

tion was decided in the affirmative: Whole number of votes cast, 15; necessary for adoption, 8; yeas, 15; nays, none. So the resolution was ADOPTED.

57) Moved, by Mr. Born (on behalf of Mr. Cornell), that it is the sense of this Board that DX activities within the League receive equal emphasis with other activities of the Communications Department which receive full-time consideration, and that the General Manager be requested to make such administrative changes as may be possible to implement this request; but the motion was rejected, 4 in favor to 11 opposed.

58) Moved, by Mr. Crossley, that the Secretary be instructed to contact the FCC requesting that the T prefix be used with the Technician license, similar to the present Novice. On motion of Mr. Maer, unanimously VOTED to amend the motion to read that the General Manager is requested to make a study of the problem of adding the letter T to the Technician prefix and to report his conclusions to the next Board meeting. The question then being on the motion as amended, the same was unanimously ADOPTED.

59) At this point, the President announced the following committee appointments for the following year:

Finance Committee:

Mr. Roberts, Chairman  
Mr. Anderson  
Mr. Gowan

Planning Committee:

Mr. Brabb, Chairman  
Mr. Born  
Mr. Cooke

Merit Award Committee:

Mr. Reid, Chairman  
Mr. Rand  
Mr. Budlong

60) Moved, by Mr. Rand, that the Secretary read all motions which have been passed by the Board at this meeting; but there was no second, so the motion was lost.

61) On motion of Mr. Maer, the following resolution was unanimously ADOPTED:

RESOLVED, that the Board of Directors hereby compliments the staff of QST for its fine work in producing the 1954 volume of QST and urges the continuation of this high standard.

62) Moved, by Mr. Crossley, that the Board do now resolve itself into a Committee of the Whole to make an informal investigation of the ARRL DX Countries List, used in connection with the DX award, consider the methods used by ARRL and others in selecting those lists and that the results of this meeting be reported back to the Board in meeting with recommendations; but there was no second, so the motion was lost.

63) On motion of Mr. Anderson, the following resolution was unanimously ADOPTED:

WHEREAS, Hugh L. Caveness, W4DW, had for many years served The American Radio Relay League and amateur radio as Director of the Roanoke Division, and

WHEREAS, the institution of amateur radio is deeply grieved by his passing on December 18, 1954

Now, therefore, BE IT RESOLVED, that the Board of Directors of The American Radio Relay League meeting in Hartford, Connecticut on May 14, 1955, on behalf of amateur radio hereby expresses its deep sense of loss at his passing.

(Continued on page 128)

# Hints & Snarls – GVZ Style

BY J. P. JESSUP,\* W2GVZ

**T**HE HANDBOOK has it all wrong. It is chuck full of dope on what to do but there's not a dern word about what *not* to do. For 34 years in ham radio I've needed a book that starts off, "Listen, Stupid, don't ever do it like that." To be a ham you've eventually got to be a plumber, steeplejack, ditchdigger, electrician (not a libel on a respectable profession) and many other things. I can louse up any of those specialties with practically no effort. Let me show you what I mean.

Now take porcelain insulators. They are useful gadgets with a breaking point of one ounce less pressure than I always exert. Wonder if it's tight enough? One more turn and C-R-U-N-C-H. They should have said, "Go easy, you big dope." In ye good ol' days I used to paint panels with a graphite mixture shorting everything; now I put plastic spray on everything, connecting nothing.

I am the kind of guy who can talk to a local with the final turned off and then forget and call DX — minus final — for two hours afterward. It isn't enough to tell me how to wire the switch — you've got to tell me to turn it on!

Oh yes, I really have a penchant for pulling plate caps off 807s when removing the safety caps, even when I accidentally let them cool off first. But my real triumph was a 4-125A. Thinking it was shot anyway, I yanked the safety cap off while it was still hot, thereby pulling off the plate cap and breaking the glass. *Then* I find out it was OK! Charge off twenty-five bucks more to experience.

When I was your age, I used to put the trickle charger on reversed polarity, cooking the storage battery to a smelly crisp. Now I drop hot solder in my shoe while up a ladder. The tattoo on my wrist? That's where I once laid down the soldering iron.

Connecting both sides of a capacitor to the same terminal, putting high voltage on the filament, drilling through a panel and into a hardwood floor — elementary. Only GVZ could get his hands on a blinker socket and wire it into the primary of the high-voltage circuit. You think you've got troubles? One guy topped me, though. He accidentally left his beam turning all night

and couldn't understand the QSB reports he was getting.

The *Handbook* I need (and Brother, so do you) should go something like this:

## Inside Construction Techniques

- 1) Never drop pliers on the 866s. You are apt to bend the pliers or melt them in the resulting arc.
- 2) If you must use a razor blade, wipe the blood off the wire. Corrosion, you know.
- 3) When tacking up 300-ohm line in the attic flatten the thumbtack, not . . . YOW!
- 4) Pick out nonconductors to drop in the rig, you old butterfingers!
- 5) Always wait two months before using any diagrams in radio magazines. That gives the editors time to sneak in the inevitable correction: "Connection 6 should have been made to this gimmick instead of that one."
- 6) Never dislocate a knee by crouching down working on the rig. For the sake of my various insurance records, that one shows up as crouching down to change a tire.
- 7) Never use celluloid coil forms. Maybe you ain't got big enough lungs to blow out the flames in one mighty puff.
- 8) Don't ever sit on the floor for hours stuffing beam elements with rock wool using the XYL's broomstick, only to find out that some big brain invented insulating pellets that you can simply pour in.
- 9) Bounce a tube on the floor with impunity but never toss it six inches onto a featherbed — that's fatal!

## Outside Construction Techniques

- 1) It takes two men to put up a skywire on an icy roof; one to catch the other as he slips over the

edge. Any ol' timer will tell you no antenna will work unless it's erected in temperatures below 15 degrees. It helps to leave hunks of your hide sticking to it.

- 2) If you must stand on a 12-foot ladder and chop through a limb as thick as your thigh to clear the beam, get the heck down pronto when she starts to go (one jump recommended).

- 3) When throwing a rope with rock attached up over a limb, remember Newton's Law of Gravity. This goes, too, for "Ol' Slippery Mitts" on top of the pole with block and tackle while you are trust-

## LOW-NOISE RECEIVER DESIGN

1645 Cameron Drive  
Lemon Grove, Calif.

Technical Editor, QST:

In the March issue the article on "Low-Noise Receiver Design" by Longerich and Smith was to me both interesting and profitable, since it enabled me to bring my receiver up to an acceptable level. I have an old HQ-120-X which I bought a couple of years back for \$65. My first attempt at improving the performance involved changing the grid-cap tubes for more modern single-ended types of higher  $\mu_m$ . This resulted in considerable improvement on the lower bands, but in substantially no improvement on the bands above 7 Mc. Believing at the time that the trouble lay in poor image rejection (with an i.f. of 455 kc. and only one r.f. amplifier this is a possibility) and in oscillator pulling, I was in the process of changing over to dual conversion on the three high bands of the receiver (above 5.7 Mc.) with a first i.f. of 5.0 Mc. However, before I had gone very far with this I noticed the above article, and it has done the trick. The cathode follower on the oscillator has eliminated the pulling (if there was actually an appreciable amount present), and the increase in r.f. tank circuit  $Q$  occasioned by the use of the cathode followers has improved the image ratio. This increase in  $Q$ , incidentally, has made the tracking more critical, but not enough so to be a serious problem. But, of course, the major improvement has been in the terrific reduction in receiver self-noise. I now feel that I have a receiver which is equal or superior to anything in the \$300 class.

There were, however, several items in the article which I feel were mistakes, and others which were open to considerable question. One of the items you pointed out, which was that two r.f. amplifiers are not necessarily better than one, since the primary function of the r.f. stage (noise-wise) is to override the noise of the mixer. (Of course, for image-rejection purposes, the more r.f. stages the better, but the law of diminishing returns sets in very rapidly.) In the present instance one r.f. stage is more than ample from the noise consideration, since the equivalent noise resistance of a 6AC7 triode mixer is

$$R_{eq} = 4 \div g_o = 4 \div (g_m \div 4) = 16 \div g_m = 16 \div .011$$

which is about 1450 ohms! (The equations used may be found on page 937 of *Radiotron Designer's Handbook*, 4th ed.) Therefore, the limiting resistance for noise production is the r.f. stage, which has an  $R_{eq} = 2.5 \div g_m = 230$  ohms.

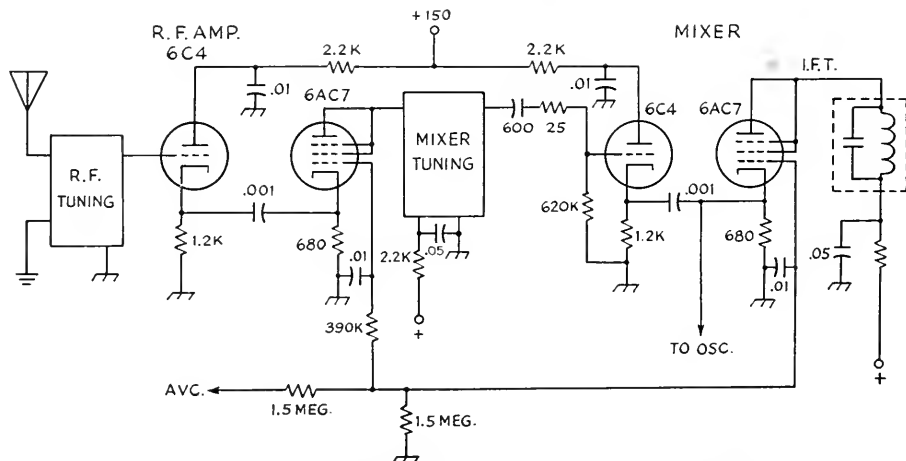

Let me back up a bit and substantiate that "therefore" in the last sentence. Assuming a minimum gain of ten times from the grid of the r.f. stage to the grid of the mixer, the effective resistance of the mixer at the grid of the r.f. stage would be  $1450/10$  or 145 ohms. The gain of the r.f. stage in the original receiver was 10, and if anything, it is greater in the present configuration. This is based on the consideration that the  $\mu$  of a triode-connected 6AC7 is 40, and the  $Q$  of the tank circuit has been increased. Hence, the mixer resistance translated to the r.f. grid would be less than 145 ohms, and the 230 ohms of r.f. tube equivalent resistance at the grid of the r.f. amplifier would be the controlling factor in noise production.

Another error, which is in some ways more obvious, is the application of a.v.c. voltage to the grid of the 2nd r.f. amplifier cathode follower in Fig. 1 of the article. If  $A$  is the gain of the tube in a normal grounded-cathode amplifier application, then the gain of a cathode follower is

$$A' = A \div (1 + A)$$

and since the gain of a 6C4 is about 10 or 12, this fraction would be in the neighborhood of  $12/13$  or about 0.92. If the gain of the tube were reduced to  $\frac{2}{3}$  by a.v.c. action, or to a gain of 4, then the cathode-follower gain would be reduced to  $4/5$  or 0.8. This is not my idea of very good a.v.c. action, since it would result in a reduction of gain of small percentage for a large value of a.v.c. voltage. A more practical method would be to apply the a.v.c. (or even better, partial a.v.c.) to both r.f. and mixer grounded grids, grounding the grids for r.f. through a  $0.01\text{-}\mu\text{f.}$  capacitor. In my receiver, applying no a.v.c. to the r.f. stage or mixer resulted in severe cross-modulation in the presence of strong adjacent signals, particularly on the broadcast bands. This was eliminated completely upon application of  $\frac{1}{2}$  a.v.c. voltage to the r.f. and mixer grids as indicated above.

In addition, the authors quoted a transconductance of 11,000 for the triode-connected 6AC7. However, the tube manual gives this value of  $g_m$  only for a plate voltage of 150 volts and a cathode bias resistor of 160 ohms. Under these conditions the plate current is 12.5 ma., and this results in a bias of  $-2.0$  volts. The 1500-ohm cathode resistor used by the authors in Fig. 1 is certain to result in a smaller effective value of  $g_m$  for the operating conditions, producing a smaller gain, and more important, more noise. I used a cathode resistor of 700 ohms in both 6AC7 stages, and would have used a smaller value if the gain had appeared to be insufficient. There should be no difficulty in obtaining sufficient driving voltage even with a cathode resistor of only

Revised front-end wiring of an HQ-120. The oscillator schematic is shown later.

100 to 200 ohms, because of the low-impedance output of the cathode follower. I have not been able to obtain a set of characteristics for the triode-connected 6AC7, so I have no idea how the variation of plate voltage will affect the picture, but as a general thing, the greater the bias voltage applied, the less the transconductance.

Another small point: In Fig. 1 of the article, it is not necessary to provide the 47- $\mu$ mf. coupling capacitor and the 47K resistor to the grid of the cathode follower on the oscillator stage. The d.c. level at the cathode of the oscillator is not sufficient to affect the operation of the cathode follower, being only a few millivolts; compared to that at the cathode of the cathode follower it is negligible. Furthermore, either the Hartley or the tickler-feed-back oscillators shown in Fig. 2 can be used as a grounded-plate oscillator. The Hartley circuit is so shown in Fig. 2; the tickler circuit need only be changed to look as follows:

This results in a somewhat simpler arrangement than that shown in Fig. 2, and uses about three components less. This is the oscillator circuit as I used it in my receiver. It is to be noted that the polarity of the feed-back coil must be observed — the end previously tied to the plate must go to ground to maintain oscillations. In my opinion this configuration results in a more nearly constant output as frequency is varied, due to the slight degeneration inherent in having a r.f. potential at the cathode. In addition, the signal is not taken from the tank circuit of the oscillator, which improves the isolation somewhat.

In closing, let me say that in my case the article was very timely and much appreciated. I am enclosing a sketch of the complete front end on my HQ-120 as it now is wired.

San Diego 7, Calif.

Technical Editor, QST:

... Before proceeding with individual points it might be well to examine the equation for the noise figure of the input stage of a system as given by Goldberg ("Some Notes on Noise Figures," *I.R.E. Proceedings*, October, 1948).

Where  $R$  = Generator impedance  
 $R_1$  = Signal generator load  
 Noise from the tube is represented  
 by generator  $R_{eq}$

$$\text{Noise figure } F = \frac{R + R_1}{R_1} + \frac{R_{eq}}{R} \left( \frac{R + R_1}{R_1} \right)^2 \quad (1)$$

The first term on the right side of this equation gives the effect upon the noise figure of a load upon the source of voltage when tube noise is disregarded. Such a load produces noise but no signal; thus, if  $R = R_1$  this term in the equation is 2. The second term shows the effect of the load

upon the source in reducing the voltage in comparison with the noise voltage contributed by  $R_{eq}$ . If  $R = R_1$ , the second term of the equation becomes  $4R_{eq}/R$ .

When  $R_{eq}$  is about the same in value as  $R$  or larger, the second term is, of course, larger than the first term and has a greater influence on  $F$ . Under these conditions, changing from the actual antenna to a dummy may cause a change in  $R$  which could swamp out the effect of any external noise present in the antenna.

Now let us consider the simple test prescribed to determine whether or not the receiver is noisy. If we take the assumption made by the authors that we are operating at a frequency where external noise is very low, there is no reason that substituting a dummy antenna for a real antenna should reduce the noise, since the radiation resistance of the antenna certainly would not have a temperature greater than that of the dummy resistance. If there were actually no external noise, this test could condemn the best receiver that could be built. The fact that very few amateurs have the equipment to measure the impedance of an antenna also makes it very difficult to assess the reason for the change in noise level when the dummy antenna is substituted for the real antenna. As shown above, with a change in impedances between the two it is quite conceivable that the noise level could increase when the resistor is substituted for the antenna.

As mentioned in the article, a low-noise-figure receiver has no advantages in a noisy location, so another simple test can be prescribed to see if the receiver is working down to the local noise level. The receiver should be set to a frequency where there are no signals and the antenna trimmer should be tuned through resonance. If there is an increase in noise as the antenna circuit goes through resonance, the receiver is satisfactory for the location. If no noise peak is noticed then some improvement is called for.

If we are to make some improvement in the receiver it is nice to know where to begin. Now we remove the antenna and swing the antenna trimmer through resonance. If we hear the noise peak there is hope that the necessary changes will not be too drastic. Perhaps in this case a new r.f. amplifier may be the answer. If we hear no change in noise, the next step is to vary the trimmer on the next grid. If a change of noise is heard, there is still hope that the receiver can be improved. If no change of noise is heard in this case, I can only recommend a new receiver or a converter.

Assuming that we have decided that we need a new r.f. amplifier, let us look into the question of what is the best type of amplifier to use. To make our calculations easier, assume that we match the antenna into the receiver, a condition which is necessary if we are to have a flat transmission line feeding the receiver. Because of tracking difficulties most receivers covering wide tuning ranges will not be more closely coupled than a matched condition. This matched condition will give us a noise factor at least 3 db. worse than we would have if we had no loss in the antenna transformer and maintained the same source impedance feeding the tube.

We should now look again at equation (1).

As stated by Goldberg, we should take the sum of the  $R_{eq1} + R_{eq2}$  for the two tubes in a cathode-coupled circuit. For simplicity, let us neglect the two cathode resistors in the circuit, which will further degrade the noise performance of the amplifier, and just assume that if there is a close contest between the cathode-coupled amplifier and one of the others, it would be advisable to select the other one. Although the authors have selected the 6AC7 as a high  $g_m$  tube they have proceeded to bias it until the  $g_m$  is down to about 4000  $\mu$ hos.

In our calculations let us consider two receivers, one with a very good input circuit which, when loaded by the antenna, offers a source impedance  $R$  of 5000 ohms to the r.f. amplifier and the other a relatively poor one which offers a source impedance of 500 ohms to the first tube. We can now look into the noise figures of four different amplifiers: a 6SK7, a 6AG5, the cathode-coupled stage recommended in the article, and a 6BQ7 cascode circuit. The noise resistances for these follow:

6SK7	11,000 ohms
6AG5	1650 ohms
6C4	800 ohms
6AC7 triode with 1500-ohm cathode resistor	600 ohms
6BQ7	500 ohms

Goldberg gives the following formulas for the noise figures:

Grounded cathode:

$$F = \frac{R + R_1}{R_1} + \frac{R_{eq}}{R} \left( \frac{R + R_1}{R_1} \right)^2$$

Cathode coupled:

$$F = \frac{R + R_1}{R_1} + \left( \frac{R_{eq1} + R_{eq2}}{R} \right) \left( \frac{R + R_1}{R_1} \right)^2$$

Inserting numerical values we have:

	$R = R_1 = 10,000$ ohms	$R = R_1 = 1000$ ohms		
	$F$	$N.F.$	$F$	$N.F.$
	(power)	(db.)	(power)	(db.)
6SK7	6.4	8.1	46	16.6
6AG5	2.66	4.25	8.6	9.35
6C4-6AC7				
cathode-				
coupled	2.56	4.10	7.6	8.8
6BQ7				
cascode	2.2	3.4	4.0	6.0

From these figures it can be seen that very little is gained by going to a system more sophisticated than the 6AG5 pentode unless  $R$  is very low and in this case it seems worth going to the cascode which is really a simpler modification than the one recommended in the article in question.

On the basis of the considerations above, I recommend that anyone contemplating the modification of a receiver give the situation a lot of study before he digs in with the cutting pliers; and it is my opinion that the modifications recommended in the article are not the easy way to improve a receiver.

— W. B. Bernard, K6EUS, Cmdr., USN

P. O. Box 790  
Dunedin, New Zealand

Technical Editor, *QST*:

Whilst the writer can fully agree in principle with the findings of Longerich and Smith in their article on low-noise receiver design, it seems that they have taken the long way round the problem.

The 6J6 has an equivalent noise resistance of 470 ohms,<sup>1</sup> and lends itself to use in the circuit shown in Fig. 1, which

is electrically identical to that used by your contributors in their r.f. stages.<sup>2</sup>

One of the advantages of this circuit is its ability to handle signals of several volts; yet it is reasonably free from cross-modulation effects. This is because the total plate current is almost constant when the control voltage is varied. For example, a drop in the grounded-grid section plate current caused by a.v.c. lowers the bias to the cathode-follower section, which in turn increases the plate current in that section. It follows then that the cathode-follower section is unimpaired by a.v.c. bias and may handle a signal input

<sup>1</sup> Radiotron Designer's Handbook, 4th ed.

<sup>2</sup> Philips Valve Data Book, Philips Electrical Industries of New Zealand Ltd., Vol. 3, ECC91-2-3.

of several volts. The degree of curvature of the grounded-grid section then determines the degree of cross-modulation. The stage gain compares more than favorably with ordinary r.f. pentodes, and it may have a.v.c. applied.

Mixer tracking, instability and oscillator pulling difficulties experienced by the authors were to be expected under the conditions of nonisolation used. A mixer capable of good gain (approximately 14 times at 30 Mc.) with quiet operation is shown in Fig. 2.<sup>2</sup> This circuit has good isolation from the oscillator. Circuit gain is independent of oscillator injection-voltage change.

An alternative oscillator to that used by the authors is shown in Fig. 3. This circuit overcomes switching difficulties

since there is no cathode tap nor are there two coils to switch as in pentagrid circuits. The cathode output gives splendid isolation from the mixer and pulling troubles are virtually eliminated.

Feed-back control is by means of  $C_1$ , which should be a silver mica for best stability. The value shown for  $C_1$  is satisfactory for operation over the range 3.5 to 50 Mc., but for operation at i.f. requires a feed-back condenser value of 100  $\mu$ f., or larger, depending on the i.f. This circuit makes an excellent b.f.o., since any old i.f. transformer will suffice for the grid inductance, no tap being required. All these circuits have been tried and are in use in the writer's receiver. They are simple to adapt into existing commercial receivers, requiring only a socket change and realignment. Manufacturers seem to have overlooked these triode circuits, and it would be worth their while to experiment with them.

— R. S. Pottinger, ZL4GP

St. John's College  
Cambridge, England

Technical Editor, *QST*:

In the March issue of *QST* Longerich and Smith discuss low-noise receiver design. The r.f. input circuit shown is a cathode-follower amplifier followed by a grounded-grid stage. I believe their interpretation of the performance of this combination is somewhat misleading, in that it seems that they assume that the low-noise performance of the grounded-grid amplifier is not spoiled by the preceding cathode follower, or grounded-plate amplifier, and in fact, no thought seems given to the choice of a triode of low-noise resistance for the cathode-follower stage, since a Type 6C4 tube is used. The noise resistance of a 6C4 is 1140 ohms compared with 220 ohms for a triode-connected 6AC7. The combination used by the authors would be somewhat inferior to a low-noise design using a single pentode-connected grounded-cathode amplifier employing a Type 6AC7 tube.

Basically, the circuit used by the authors is a grounded-plate grounded-grid triode amplifier. The conventional circuit is (simplified):

Here neutralization of the first stage is required except perhaps for the case where triode-connected pentodes are used.

The cathode interstage coupling coil is designed to present optimum admittance to the grounded-grid tube for

## NEW SYMBOLS

Box 364  
Bellport, N. Y.

Editor, *QST*:

... I am particularly offended by the new designations for inductors and chassis grounds. ...

— William R. French, W2NYC

2521 W. Cold Spring Lane  
Baltimore 15, Md.

Editor, *QST*:

I protest! Back to the old symbols. Perhaps I'm used to the old ones after all these years, but I certainly can understand the old ones without redrawing the circuits. Let's not be too much of a leader in this field.

— Samuel Geller, W3MQF

320 Winslow St.  
Watertown, N. Y.

Editor, *QST*:

... I can no longer "see" the circuit but must laboriously "feel through" the similar symbols. Incidentally, the last time I used a "chassis" which was not common to "ground" I got 1100 v. d. c. and came to consciousness 10 feet away. Shouldn't we switch back to safety?

— George Bonadio, W2WLR

West Main St.  
Chester, Conn.

Editor, *QST*:

... I suggest that for the next few issues of *QST*, you set it up in German script, which would go well with the new diagrams, and help us over the transition period. We all would then concentrate more on the diagrams and less on the text, and thus more easily learn the new and forget the old.

Of course I am not really serious as I can see the advantages of standardization, although it is rather bitter to take in one gulp.

— G. Roger Gladding, W1AOS

P. O. Box 69  
Billings, Mont.

Editor, *QST*:

... Maybe the alphabet should be revised too. It too has a lot of little loop holes to fill up with ink like the old coil symbol. Wonder how many of those responsible actually use the "New Look" in their daily sketches? My soldering iron didn't get much work out from the past two issues of *QST*. But, I suppose in due time we will all get accustomed to it. It is about time the different branches of the electronics industries standardized in their symbols.

— S. P. Guth, W7KGF

## THIRD-PARTY TRAFFIC

51 Pettits Lane  
Romford, Essex, England

Editor, *QST*:

After reading the letter from W1DLO on the above subject in May *QST*, I feel that I ought to correct a widespread misunderstanding regarding G stations. We are not allowed to accept or originate third-party messages in any shape or form as laid down by our license conditions, and any station so doing is liable to receive the G equivalent of a pink ticket by return of post.

In the past I have heard W stations calling specific cities in this country and saying that they have traffic. They have probably been disappointed in not receiving a reply, and I hope the true reason will be appreciated.

While on the subject of traffic, may I enter a plea for the

removal outside the ham bands of the MARS stations in Europe and Africa who clutter up our frequencies with high-power stations passing military traffic only. These messages generally relate to movement of personnel and supplies, etc. The stations use amateur call signs and are prevalent on the 20-meter band. In Europe we suffer enough commercial QRM on this band without this addition, and I would have thought that the operators, who appear to be hams, would have appreciated this fact. Presumably, however, this operation has official backing.

— R. F. Stevens, G2BVN

602nd AC&W Sq., Box 325  
APO 34, New York, N. Y.

Editor, *QST*:

... Although I could write a great deal pertaining to flag waving and sentiment, I feel it would have little effect on the FCC. I can fully understand the need for the law; however, I cannot see why it should pertain to military personnel.

All DL4 stations are U. S. military personnel. Although the licenses are issued by the German government, all exams are given by U. S. military officers, all stations are located on property controlled by the U. S. government, and the majority of the equipment is owned by the U. S. government. This certainly makes us controlled more by the U. S. government than most parties listed as free to handle third-party traffic.

The majority of the DL4s are MARS operators and just about all the operating is done from MARS-controlled stations. However, there is only one MARS frequency on which conditions and power permit us to reach the States. This is hardly enough to handle priority traffic (pertaining to deaths or serious illnesses) much less normal traffic.

I would certainly appreciate you giving our side of the situation the same consideration you gave the opposite side.

— A/2C William B. Sanders, DL4TU

## LEVELING PROCESS

19 Paton Street  
Piccadilly, Manchester 1  
England

Editor, *QST*:

I read with disappointment the letter from one of our fellow Gs on the subject of QRP (April *QST*).

What he says may be true of a certain type of ham; one, say, who believes in bringing everyone in every way down to his level. But it must not be imagined that we all feel like that. Some of us are very tired of this leveling-down process we are subjected to over here, and would hate to see it applied where it does not exist in other countries.

Our friend's suggestion of a general limitation to 150 watts does not seem to me to offer any solution to his complaint, and even if this was the case, some would get out better than others, and there would still be the same number of stations. I suppose he would then start a campaign for half-wave dipoles only to be used.

Finally, if some brother ham wants to spend some of his money on a bigger and better rig, I say good luck to him. ...

# QST—Volume IV

## Part I† — Foreword to Sumner B. Young's (WØCO) Index

VOLUME IV of *QST* was the second complete Volume to be published under the management of a full-time editor (the late K. B. Warner). It was issued during the period August, 1920, to July, 1921, inclusive.

Volume III of *QST* had been a big one, as readers of my index will have seen; but Volume IV was to surpass it, both in size and importance.

As a "background" for Volume IV, let us review some of the events covered by Volume III.

A great "boom" in amateur activities had followed restoration of transmitting privileges in October, 1919. Amateurs had begun flocking to local and regional meetings. On a small scale, "tube" transmission had begun; and the new editor had encouraged it enthusiastically. A few progressive amateurs had "taken up c.w." despite the coolness toward it which many friends of the spark transmitter had instantly displayed. With the advent of Volume IV, the groundwork for further progress in this (and other) fields had been accomplished.

One of the most interesting items in Volume IV is an editorial published in the September, 1920, issue ("In Introspect"), which contains a review and an evaluation of the happenings of the previous twelve months. As of that date, it was Mr. Warner's opinion that during the first year of amateur work following the restoration of transmitting privileges in October, 1919, the development of "tube" transmitters had constituted our most significant achievement. Despite the difficulties of obtaining power tubes (not yet placed on the amateur market), and regardless of the expense of producing suitable high voltage power supplies for the plate circuits, the "pioneers" had done the job. Some of them had held Special or Experimental-Station licenses, and could lawfully operate on wavelengths around 300 to 350 meters — which was a distinct advantage, because most of the early c.w. transmitting circuits (a term loosely applied to c.w., i.c.w., and 'phone arrangements) would not operate below 300 meters. Others, who had held only General amateur station licenses officially limiting them to waves not exceeding 200 meters, had also participated in this early work (with or without a special permit); but the Department of Commerce had been indulgent; and, in any event, it had lacked sufficient personnel and financial appropriations to enable it to "crack down", even if it had wanted to do so. Nobody had paid much attention to the 200-meter restriction, even in the case of spark

stations; and (in 1920–1921) the over-all average amateur wavelength in actual use was at least 240 meters. (See Warner's editorials, at 31–32, January 1921, and at 25, April 1921.)

Volume IV of *QST* records some significant events occurring in the c.w. field: (1) In the Spring of 1921, the R.C.A. power tubes arrived. The famous "5-watter" (the UV 202) was first released. Then came the very-popular "50-watter" (the UV 203), and the announcement that larger tubes (not so important to the widespread development of the art, as it turned out) would be released in fall of 1921. (2) P. J. Furlong's article on the electrolytic rectifier was published. (3) E. W. Whittier's article gave data on the famous "1DH" c.w. circuit (also called the "sure-fire c.w. circuit", the "reversed-feedback circuit", the "Stanley circuit" and the "British-aircraft circuit"). And (4) John Reinartz published his memorable article on his "C. W. Tuner".

Events (3) and (4), in the above list, showed amateurs how to operate "tube" transmitters on 200 meters, or on wavelengths even below 200; and they also taught them how to receive, and to hold, a c.w. signal over a wide range of wavelengths. As a result, more tube sets went into operation, down below 300–350 meters.

Another characteristic of the busy and eventful months covered by Volume IV of *QST*, was this: Hams had become so numerous, that some means of controlling their own "use of the air" had become imperative. Almost everybody was operating at about the same wavelength (240 meters; not at the legal maximum of 200 meters, or below it). Spark transmitters — notorious "QRM-producers" — were still the most widely used type of rig. Practically none of the c.w. stations were using "pure c.w." (see 57, July 1921); and the radiophones created so much interference that one expert (Kruse) reached the conclusion that as far as he was concerned they were "an obnoxious perversion of the c.w. set". (57, July 1921).

The resulting din in the ether was terrific.

Note that this QRM situation was still very largely an amateur affair. It is true that some broadcast-listeners (BCLs) had also arrived on the scene; but the great public "rush" to equip one's home for the reception of broadcast programs did not get under way until fall of 1921.

The principal method of resolving this particular problem was quickly developed. It was the so-called "Chicago Plan", originated by F. H. Schnell and R. H. G. Mathews, and sponsored and administered, originally, in the Chicago area, by the Chicago Executive Radio Council. A time schedule was agreed upon, and enforced. Different classes of

† For previous installments see following *QST* references; Part III of "QST—Volume III," June, 1955; "QST—Volume I," October, 1954; "QST—Volume II," February, 1955; Part I of "QST—Volume III," March, 1955; Part II of "QST—Volume III," April, 1955.

amateur radio communication were allotted a place on the schedule; and (for a while at least), great improvement in operating conditions was achieved. This plan depended upon the organization of strong clubs — particularly near large centers of population. It had the outstanding merit of providing an essential function for those clubs to perform; and, for that reason, it tended to develop a fine group of local and regional organizations affiliated with the League.

The "Chicago Plan" spread rapidly over the U. S. A. But when (at a later period of time) the problems connected with BCI became so numerous and so serious that amateur radio's very existence was endangered, this scheme proved to be inadequate. (We shall see, later, when we examine Volume V of *QST*, that attempts to bring the BCLs into the amateur clubs, and to make these listeners parties to any agreements about "use of the air," were hopeless; and that only *technological* solutions were of any avail.) It is true that even back in the period extending from August, 1920, to July, 1921, some of the more far-sighted amateurs suggested that the development and use of waves below 200 meters was imperative, from the standpoint of *QRM avoidance*.<sup>1</sup> Unfortunately, their views were little noticed. But, "for the record," I wish to draw your attention to three items: (1) The work of Professor R. V. Achatz, City Manager in Lafayette, Indiana;<sup>2</sup> (2) A remarkable letter from F. B. Llewellyn;<sup>3</sup> and (3) An instructive and well-reasoned letter from W. F. Scott (2PP).<sup>4</sup>

The period with which Volume IV of *QST* deals was also characterized by other problems. One concerned allotment of wavelengths below 200 meters at a time before the full usefulness of such waves had been even faintly proved:

<sup>1</sup> In fact, suggestions to this effect had been made as far back as October, 1919. See 26 to 27, October 1919. Other references: 20, January 1920; 17 to 18, February 1920; 13 to 14, February 1920; 40, December 1920; and 35, November 1920.

<sup>2</sup> 44, June 1921. This is an item under "Strays," and reads: "We are proud of the city of Lafayette, Indiana. Professor R. V. Achatz of Purdue University, City Manager, reports he has his city tuned down to 200 meters, and has personally checked up every station under his jurisdiction, with several of the smaller stations operating on 160 and 180 meters. Let's have more cities like Lafayette." (Italics by S.B.Y.)

<sup>3</sup> 59, 64, January 1921. This letter points out the great difficulties to be faced in attempting to eliminate interference by time-schedules, and then says: "... The new plan is taken from Naval procedure.

"The idea is based on a change of wavelength. A designated wave is fixed on which all calling shall be done. Other wavelengths are arranged so that once having established communication, it is a simple matter to shift to a wavelength on which there is no interference. . . .

"The amateur is limited to 200 meters. During the war the Navy used a wavelength of 52 meters for short distance work. Amateurs whose powers do not exceed  $\frac{1}{4}$  k.w. could use 100 meters or less without a very appreciable decrease in range. They would then be free from jamming by higher powered amateur stations.

"Each higher powered station should be tuned to a slightly different wave under 200. It would not be difficult to have these waves published in the call books.

"Under these circumstances a common calling wave would not be necessary. . . ." (Italics by S.B.Y.)

a series of attempted "grabs" by the U. S. Navy commenced.<sup>5</sup> Another involved the assignment of wavelengths around 300 meters: the A.T.&T. wanted these for use in ship-to-shore telephony.<sup>6</sup> Editor Warner thoughtfully sounded the warning that it was necessary for the radio art to develop every single wavelength which could be put to practical use.<sup>7</sup> How many of us paid attention, I do not know.

Closely allied with wavelength allocation problems were activities in the legislative field. With the rise of broadcasting, and the development of interest in short waves as a potential source of many communication channels, the old Radio Act of 1912 had begun to "break down." It did not confer upon the Secretary of Commerce adequate means and discretion, in the matters of: the classification of radio stations, the prescription of the services which they should perform, and the specification of the frequencies upon which they should operate. He even lacked power to deny a request for a broadcasting station license which actually (from the standpoint of public interest, convenience, or necessity) would clearly be improvident to issue. Although the first of the so-called "National Conferences" between representatives of the radio industry and various governmental agencies was not held until February 27, 1922,<sup>8</sup> Secretary Herbert Hoover (at an earlier date — in 1920) named a committee to recommend a new radio law "to meet modern conditions"; and he appointed Mr. Charles H. Stewart (of St. David's, Pennsylvania) to serve on it as the League's representative.<sup>9</sup> In 1920, this committee, "consisting of representatives from every radio interest in the country" gave consideration to the question: What should be the amateur's wavelength assignment in the new law to be recommended

<sup>4</sup> 55 to 56, December 1920. Scott described and diagrammed a tuned spark-coil set, using a Century buzzer as an independent interrupter, giving a good 500-cycle note. Means of bringing the primary circuit of the spark coil itself into resonance with the frequency of the buzzer, by means of a large choke having a sliding metal core, were disclosed. This transmitter covered 10 to 20 miles, with an input of 8 to 10 Watts, on "200 meters." The letter then states: "... With the same set using a smaller condenser and a loading coil in the open circuit, signals have been transmitted about a mile on a portion of the lead-in 25 ft. long and 20 ft. high. The wave used was about 180 meters. Good radiation was obtained but very few sets in the vicinity were able to get down to some of the low waves used.

"Through these experiments I believe it is entirely possible for amateurs to have a small indoor aerial for work on waves as low as 100 meters and with which local communication could be carried on successfully, thus eliminating some of the QRM on 200." (Italics by S.B.Y.)

<sup>5</sup> 33, July 1921. This editorial indicates that the Navy wanted a wavelength, down below the suggested amateur wavelength assignments, for "chaser boats."

<sup>6</sup> 33, July 1921. The editorial "What We Want in Radio Law," here cited, states: "... with the Navy below us and the A.T.&T. above us, both clamoring for more room, believe us, we would like to see our wavelength written into the law so that there would be no question about it. . . ."

<sup>7</sup> 33, July 1921. "... the intensive development of radio demands that use be made of all waves. . . ."

<sup>8</sup> See "The Memoirs of Herbert Hoover," (Volume called "The Cabinet and the Presidency"), pages 139 to 148.

<sup>9</sup> See Warner's editorial: "In Introspect," at 23, September 1920.

by the conferees? The answer was this: 180 to 220 meters, for spark stations, and 180 to 250 meters for c.w. stations.<sup>10</sup>

As of June, 1921, no less than seven radio bills were pending in Congress.<sup>11</sup> The most "unpalatable" of these was "Senator Poindexter's infamous S. 31."<sup>12</sup> Offsetting this, was Congressman White's Bill, H.R. 4132.<sup>13</sup> An ARRL "legislative committee" was watching developments; and Secretary Warner visited Washington to gather information and to report his findings.<sup>14</sup>

The June, 1921, issue of *QST* also mentions the fact that the Department of Commerce had sent a representative to Paris in the year 1920 to attend a *preliminary international conference*; and that the report prepared at that gathering was "already influencing practice in the choice of wavelengths, in the classification of modern types of radio systems, etc."<sup>15</sup>

The period of time reflected in Volume IV of *QST* was also marked by the rise of the big conventions. These eventually were to lead to a National Convention, at Chicago, in September, 1921. The large-scale affairs held at Philadelphia, St. Louis, New York, San Francisco, and Chicago, were the most noteworthy.<sup>16</sup>

In this same period, amateurs, in coöperation with the U. S. Bureau of Standards, participated in several series of so-called "fading tests", in an attempt to discover the causes of fading.

First transmissions were on 250 meters. Some later transmissions were made on 200 meters. Both spark and tube transmitters were used.

The scientific results were not of great importance; but the several series of tests represented an outstanding example of amateur coöperation with government agencies.

In the April, 1921, "fading tests," one station (9ZN, at Chicago) operated two transmitters, simultaneously, on 200 meters; 3XF and NSF were "on the air," at the same time (on 200), with i.c.w. sets; and 9LQ and 9JZ transmitted (on 200), at the same time using synchronous-spark transmitters.<sup>17</sup>

Other coöperative activities involved the use of amateur stations to disseminate police, Market-Bureau, and Weather-Bureau reports and information. A report received (from KUVS) by Messrs. Richard Frank and William Mitchell, who operated station 2TK, at Union Hill, N. J., resulted in the recovery of the first "hot" car to be located with amateur help. This was about March 21, 1921.<sup>18</sup>

With the increased use of radiotelephone transmitters, in particular, amateur stations began to be used for broadcasting, and for other purposes which have long-since been declared illegal.<sup>19</sup> (When we study Volume V, of *QST*, we shall see some of the consequences of the indiscriminate use of poorly operated amateur radiophone stations.)

The spark transmitter was still a favorite, with most amateurs; and, in fact, some of the DX records held by such stations as 2BK, 2RK, 6JD, and 9ZN, were "mighty impressive."

2BK was heard in Los Angeles, by 6KA, on April 19, 1921, at about 4:38 A.M. (EST).<sup>20</sup> The world records of 2RK (J. K. Hewitt, of Brooklyn, N. Y.),<sup>21</sup> listed on page 43 of the February, 1921 issue, included the following items: (a) December, 1920 — copied by an American ship, from New York to London and return; (b) Copied on a Grebe CR-6 receiver, by an English vessel, at Gibraltar (3,200 miles); and (c) Reported heard off Pernambuco, South America, on a Navy SE-1420 (non-regenerative) receiver, a distance of 3,600 miles.

Stations 6JD, 9ZN, and 1AW, "hung up" a new record for a round-trip "transcon" message, on the night of January 17th-18th, 1921, when they handled one "over and back," in 6½ minutes.<sup>22</sup>

DX work, and large scale message handling, with various types of tube transmitters also began to be reported. These reports were impressive, largely for the reason that the power of most c.w. stations (as of, say, July, 1921) was under 50 watts.<sup>23</sup> Station 2ZM was heard (on

C., store".)

<sup>20</sup> 45, June 1921. "Old" 2PM, according to an unverified report, was copied in Los Angeles before World War One. See: 24, November 1920; and 23, April 1921.

<sup>21</sup> See, also: 23, April 1921; 30, May 1921; and 53, May 1921.

<sup>22</sup> 12, March 1921. 27, April 1921 (Trans-continental c.w. relay-route being formed).

325 meters) by a ship in the Pacific Ocean, located off Guatemala, Central America.<sup>24</sup> Frank Conrad's station, 8XK (in Pittsburgh), which used an "r.a.c." plate supply, was heard 3,000 miles away.<sup>25</sup> And on the night of July 10th, 1920, a non-amateur station, NSF, using two 250-watt tubes, and an Alexanderson multipletuned antenna, was heard in Bristol, England.<sup>26</sup>

With records like these before them, it was only natural that amateurs should speculate on the possibility of bridging the Atlantic, by means of amateur transmitters; and (in February, 1921), the first "transatlantic tests" were run. These were hastily organized and were not properly planned. In any event, the tests failed; and perhaps their principal value was to disclose certain defects of planning and of preparation which the "second transatlantics" avoided. (The story of those second tests is covered in Volume V of *QST*.)

In the May (1921) issue of *QST*, Mr. Warner (at page 16) made the interesting announcement that he would bet his new spring hat that if a good U. S. amateur were sent to England with a standard American regenerative receiver (using variometer tuning in the secondary and tertiary circuits), and with an Armstrong superheterodyne, "reception of U. S. amateurs would straightway become commonplace." (Italics by S.B.Y.)

Volume IV also records the results of the "Ideal Relay Spark Transmitter Contest." This represented the first orderly and systematic attempt to collect, and to summarize, the learning which amateurs had acquired on any one subject. By the time when the findings were published, however, the "shift-over" from spark to c.w. had acquired considerable momentum; and amateur spark transmitters had only a short time to live.

Emergency and relief work, by amateur stations, during the period covered by Volume IV of *QST*, was almost nil. Cushing, of Duxbury, Mass. (1FBF) performed the most noteworthy work within this category: On November 28, 1920, the U. S. Minesweeper *Swan* went ashore, near that place, in a terrific northeast gale. She was unable to "raise" the Boston Navy Yard, on her radio; so Cushing relayed her traffic to KQZ (S.S. *City of Rome*). She, in turn, passed it on to NAD. (The crew of the *Swan* was rescued.)

The best "reminiscences" published in Volume IV were those written by Irving Vermilya, concerning the "passing" of old WCC (Cape Cod). These will be found at 16 to 17, August 1920.

In the short-wave field, the advent of John Reinartz's "C.W. Tuner" provided a means of receiving waves down as low as 150 meters.<sup>27</sup>

But commercially-built receivers were still inadequate for reception of signals below 200 meters. The September, 1920, issue of *QST* reported<sup>28</sup> that "old" 6KL (William Wood), now Canadian 5BR (of Vancouver, B. C.) was transmitting on 100 meters, with 1½-k.w. of power, and that he was hoping to contact some U. S. amateurs in the 7th District. (I have since wondered what results he had down there.)

The November (1920) issue, at page 35, announced that E. A. Bessey (6BR, of Sunnyvale, California) had installed "a new panel-type transmitter designed for 150, 200 and 375 meters"; and it stated that this would "greatly relieve the QRM situation."

At page 40 of the December (1920) issue, I find that John D. Hertz (7ZB, of Portland, Oregon) announced that he would do local work, on c.w., on 150, 175, and 200 meters. (Again, I wish I knew what the results of his work turned out to be.)

Sunspots, magnetic storms, and Aurora-Borealis effects were noted by various amateurs.<sup>29</sup>

A "dead-spot", near Savannah, Georgia, was explored by 4YA. He arranged tests between a radiophone station, mounted in a truck, and other amateur stations.<sup>30</sup> Two other "deadspots" — between Springfield and Boston, Massachusetts, and between Springfield and Worcester, Massachusetts — were also noted, but were not explored.<sup>31</sup> The Bureau of Standards sought data concerning "dead-spots" at sea.<sup>32</sup>

In the "miscellaneous" category, readers of the Index to Volume IV of *QST* will be interested in the following items:

(a) *League affairs:*

League Officers began to visit hams in various parts of the U. S. A.; and Mr. Maxim became the first League officer to visit amateurs on the West Coast.<sup>33</sup> While in San Francisco, he made an address over the De Forest radiotelephone station.<sup>34</sup>

F. H. Schnell became the League's first full-time Traffic Manager.<sup>35</sup>

During the Midwest Convention at St. Louis, the League's Board of Directors met in that city; and "for the first time our directors from the west and south actually sat in with those from the east and north."<sup>36</sup>

At the Pacific Division Convention, in San Francisco, "the question arose of forming a separate relay league on the Pacific Coast, to be entirely independent of our American Radio Relay League." This was overwhelmingly defeated.<sup>37</sup>

(Continued on page 138)

<sup>24</sup> 35, July 1921. In April, 1921, it was stated that 2ZL (J. O. Smith, of Long Island, N. Y.) was probably the most-powerful amateur c.w. station. See 27, April 1921.

# Y L NEWS and VIEWS

BY ELEANOR WILSON,\* W1QON

## Results — YL-OM Contest

The Sixth Annual YL-OM Contest sponsored by the Young Ladies Radio League attracted more YLs and OM's than ever before. Two-hundred seventy-four logs were received, an increase of about 100 over 1954. One hundred sixty-eight of the logs came from OM's, along with such comments as:

"Didn't realize there were so many fine c.w. operators — and so patient they would operate at any convenient speed."

"The thrill of a century — will be aboard next year."

"Lots of fun — more girls on c.w. this year."

"Having c.w. and 'phone on separate week ends excellent."

The following message was received from YLRL Vice-President Gilda Shoblo, W6KER:

"I wish to thank everyone for sending in reports, and of course, my heartiest congratulations to the winners, as well as my condolences to the very fine losers. In the long run we all win. Some of the reports have been altered, mostly due to contestants sending in combined scores. I hope the tabulations and awards are as near correct as possible; if not, I shall be very happy to make corrections. Also, I shall be pleased to receive suggestions and comments on the contest, so that the next officer can know of any changes desired by the contestants.

Since the rules of this contest were published, I have discovered there is a Silver Cup awarded specifically for top or aggregate score. Since this cup is awarded and so inscribed for this "specific" category, and due to the many, many aggregate scores sent in for this award (ostensibly), having no alternative but to give this to the winners for which it is intended, I have done so."

## YL SCORES

Aggregate YL Winner: W4HLF, Arlie Hager, 27,682. Highest c.w. scores: W4BLR, 10,755; W4HLF, 10,132; W9JUI, 7880. Highest 'phone scores: W4KYI, 25,818.75; W1SCS, 24,096; W4HLF, 17,550.

\*YL Editor, QST. Please send all contributions to W1QON's home address: 318 Fisher St., Walpole, Mass.

The following stations submitted c.w. logs for checking purposes only: W4RLG, W7s RHM, RRM; VE3s AJR, DDA.

## OM SCORES

Aggregate OM winner: W1BFT, Carl Evans, 3705. Highest c.w. scores: W1BFT, 1820; W8AJW, 1820 (tie for first place); W4IA, 1102.5; W4JUI, 892.5. OM 'phone winners: W4ARR, 2287.5; W1BFT, 1885; W9CMC, 1295.

The ten YLs who attended the East Texas Hamfest at Longview in April had a "fine old rag chew," according to Maxine, W5YRT, who forwarded the above photo. Left to right the smiling femmes are: W5s UYI, UUS, RYX, WN5FDR, W5s TKM, VYI, LGY, YRT, YAJ, and VSN.

The following OMs submitted 'phone logs for checking purpose: W1s BUD, LQ, PO, YGR; K2s AEQ, AFQ, DSW, EUI, HID, KID; W2s BVN, CVW, CYK, IFI, UAP; W3s YG, YUT; W4s FPD, VGD, WRH/4; W5ZWR; K6DYW; W8s FAD, FRD, MQD; W9s KLD, SIE; W0s IJU, LOW, VRN, YQR.

The following OMs submitted c.w. logs for checking purposes: W1s BOW, JZA, NLM, VBR, YGR, YUN; K2s BUE, BUP, CMV, MTA; W2s BUN, CVW, NEP, OLT, REP; W3s JUN, NRE, QLV, RRI, WG, ZID; W4s FFX, GMY, RXI, WRH; K6DYM, KN6INU, W6PQK; W8s DAE, GQD; W9s EDH, FYM, PQA, RKP, SIE, UDK; W0s JBM, VRN; VE6SX.

Aggregate winners W1BFT and W4HLF each received a silver cup and were awarded certificates for various other high scores.

In 1954, W4KYI received the highest aggregate score and a silver cup. In 1955, W4HLF had the highest aggregate score and received a silver cup. The highest 'phone score (gold cup) was made by W4HLF in 1954—in 1955 the cup goes to W4KYI.

We wish to thank participants who called our attention to the fact that rules published for the 1955 contest omitted mention of a silver cup to be awarded for the highest OM combined score and a silver cup to be awarded for the highest YL combined score. We regret any misunderstanding which may have resulted from this omission.

For W4AHN, Merle McClain, of Alexandria, Virginia, the YL-OM C.W. Contest was a first

venture into a contest. Merle says that the experiences of those two days "forced" her to preserve her thoughts on paper, as follows:

### The Monday Morning Blues

My ears ring with a dit-dah tune 'tho the contest's over and I'm back to earth pushing a vacuum cleaner through a house that's a shambles. Dirty dishes in the sink—quick! close the door to the shack—hide it from human eyes. Only a ham would understand.

I brushed-up my c.w. three weeks before the YL-OM contest when a license renewal reared its dit-dah head. I gingerly touched the dit side of the bug and jumped clear across the room; the result of five years of neglect, I'm sure.

But thanks you patient OMs; all 65 of you. As for those who QRSD, I'm certain you'll go to ham heaven where there's no QRM or TVI and DX is unlimited! Forgive me, W9DO, for making a DOG of you—conditions you know, not my 13 w.p.m.

Glad to give reports on your two antennas, W3KTR, even 'tho it was in the midst of the con-

"My ears ring with a dit-dah tune"—W4AHN

test! Hope you know better than to count too much on this YL's untrained ear.

One thing boomeranged, though. Once after a number of repeats on a QTH, I was embarrassed and answered with an R. Thought I'd be smart and look him up in the call book. But the joke's on me—he's not in "Summer 1954." Moral, gals: always lead the good clean life.

Speaking of OMs, mine is a very patient one. Well, fairly patient. He'd wander into the shack and remark something like "It's three o'clock. How about something to eat?" I'd stare glassy-eyed while busily calling CQ OM. Quietly, he'd leave, but I know he didn't starve—not with all those dirty dishes I found in the sink. On Sunday I knew for sure that I had married him for better, not worse. At 0830, into the shack he strolled with a breakfast tray—HAM and eggs!

That's why I feel so bad about deliberately letting our Sunday dinner burn. A roast's the thing, I had thought. I'd just throw into into the oven; it would cook itself. I cannot tell a lie (other than a signal report). I smelled it burning and pushed the thought from my frenzied brain. A Wisconsin was calling me

(Continued on page 134)

# Hints and Kinks

## For the Experimenter

### RESISTOR HINTS

IN reworking a Q5-er, it was discovered that all resistors were conductive between the outside surface and the leads. This condition was especially prevalent in the gold-band section of each resistor. Upon breaking a few of the units open, it appeared that they had no insulating coating such as applied to present-day jobs. Apparently, the grey carbon impregnating material extends all the way to the outside of each resistor. Naturally, faulty operation of the receiver will occur if one such resistor makes contact with the chassis, another part of the circuit, etc.

— E. M. Fry, K2CW

### POWER-REDUCTION HINTS FOR S.W.R. BRIDGE MEASUREMENTS

ONE of the problems frequently encountered in making s.w.r. measurements is that of reducing transmitter power output to a level low enough to prevent damage to the bridge. In installations where there is no existing means of controlling output from the amplifier, it is possible to control the power to the bridge by means of the simple system shown in Fig. 1. In this arrangement, most of the output from the transmitter is dissipated in the 52-ohm dummy load

Fig. 1 — A simple arrangement for reducing power during s.w.r. measurements. A is a "T" coaxial-cable coupler and B is a variable capacitor with a range of approximately 0–100  $\mu\mu$ f.

and a portion of the remaining power is fed to the bridge through a variable capacitor.

The dummy load must be capable of dissipating nearly the full output from the transmitter. It should be shielded and equipped for coaxial-cable input. The variable capacitor should also be enclosed in a metal compartment and should be terminated with coax connectors. A standard "T" connector and short lengths of coax may be used for making connection between the transmitter, dummy load and variable capacitor.

When using this method of power reduction, the bridge is inserted in the transmitter output line in the usual manner. Then adjust the variable capacitor for normal reflection of the s.w.r. indicator and proceed as you would with any other set of adjustments or measurements.

— John W. Stack, W5QQY

### INPUT CIRCUIT FOR EITHER CRYSTAL OR CARBON MICROPHONES

THE circuit shown in Fig. 2 permits feeding the output of either a crystal or a carbon microphone to the speech-amplifier tube. The closed-circuit jacks automatically convert the circuit

Fig. 2 — Schematic diagram of the speech amplifier designed for either crystal- or carbon-microphone input.

for whichever type of microphone is used. When using a crystal or other high-impedance microphone, it is plugged into  $J_1$ . In this application, the cathode circuit for the 12AX7 is completed through  $J_2$ . With  $J_1$  closed (microphone plug removed) and with a carbon microphone plugged into  $J_2$ , the stage operates as a grounded-grid amplifier. The second half of the dual triode is used as a conventional voltage amplifier with a gain control in the grid circuit.

— Vernon Phillips, W7NPV

### CUSTOM-MADE NAME PLATES

ALL you need to make attractive custom-designed name plates for the new rig are a package of transmitter decals (Tekni-Labels, Burbank, Calif.), narrow strips of aluminum, clear finger polish and a piece of crocus cloth or polishing paper.

The strips are cut to the desired width and length, a mounting hole drilled at each end, polished with the crocus cloth or paper, cleaned of abrasive dust and given a quick even coating of nail polish. After the polish dries, the decal may be affixed and allowed to dry thoroughly. Then one or two more coats of polish should be applied, each coat being given sufficient time to dry completely.

The result is an inexpensive indicator or name plate that is commercial looking in appearance. As the drying of the nail polish is tricky, since it dries so rapidly, it is best to experiment first before going into production. The instructions supplied with the Tekni-Labels should be followed closely.

— Rev. Joseph F. O'Reilly, W9UFL

CHASSIS-LAYOUT AID

THE construction practices chapter of recent editions of *The Radio Amateur's Handbook* makes the excellent suggestion that one commence construction by covering the chassis with a sheet of paper. The location of components, mounting holes, etc., is then marked on the paper so that the latter may be used as a drilling template for components to be mounted above deck. After drilling, the parts which require mounting underneath may be located and the mounting holes drilled, making sure by trial that no interference exists with parts mounted on top.

An easy way to ensure a good alignment of components below with those above the chassis is to place a sheet of translucent paper (onion-skin) on top of the chassis, and mark on its top surface the position of topside parts. Then place the same sheet against the underside of the chassis, unmarked side exposed, and locate the parts to be mounted inside the chassis. Since the paper is translucent, these may be easily placed so as not to interfere with components on top of the chassis.

— David Weinfeld

PARALLEL 6Y6s FOR THE SIMPLEST MODULATOR

THE simple grid modulator described by 7W6LNN in *QST* for September, 1953, has usually lived up to its name if constructed with a single tube in the output stage. However, the installation of parallel 6Y6s in the modulator has occasionally resulted in instability within the unit. With the assistance of W8RXX, and with the addition of a few inexpensive components, it has been possible to stabilize the parallel-tube arrangement. Fig. 3 shows the revised circuit which, incidentally, is used to modulate

resistors  $R_{12}$  through  $R_{13}$  are the recent additions to the modulator and are the components which stabilize the new arrangement.  $R_9$  of the one-tube layout has been replaced with a 100-ohm variable to provide a convenient means of adjusting the plate current of the r.f. amplifier. This adjustment is particularly helpful when resetting the plate current to half value after band changing.

— Philip J. Hart, W8MMK

[EDITOR'S NOTE: The simple grid modulator referred to above is also described in Chapter 9 of recent editions of the ARRL *Handbook*.]

ADDING A SPINNING REEL TO THE BOW-AND-ARROW TRICK

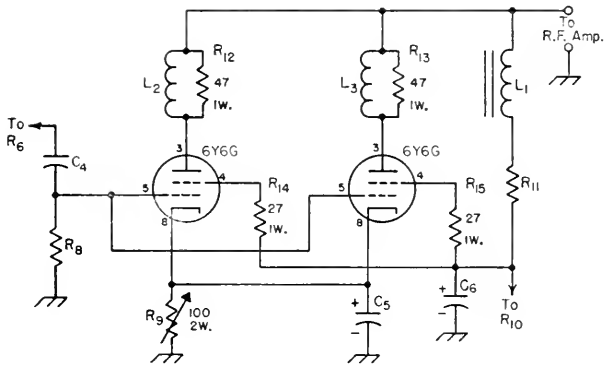

THE trick of using a bow and arrow to shoot an antenna halyard into place can be improved on by using a spinning reel and rod as a means of paying out the guide line. Four-pound nylon test line and a short rod is the best combination to use. Tie the line to the arrow just to the rear of the feathers. As the arrow passes over the top of the tree or other type of support, have the person holding the rod apply enough pressure to the reel to control the flight of the arrow. When the arrow has landed, untie the nylon line and fasten the halyard in place. Now haul the halyard back to the firing position so that the halyard and antenna can be connected together.

— E. M. Fry, K2CW

IMPROVED R.F. CABLING FOR REMOTE-TUNED VFOs

AFTER constructing and using several remote-tuned variable-frequency oscillators, it became apparent that one of the weakest points in this system is the cabling between the frequency-control box and the rest of the oscillator. Instabil-

Fig. 3 — The simple grid modulator circuit used by W8MMK.  $L_2$  and  $L_3$  are each 10 turns of No. 26 enamel wire wound over  $R_{12}$  and  $R_{13}$ , respectively.

the popular 4-250A amplifier described in recent editions of the *Handbook*.

Many of the components shown in Fig. 3 bear designations —  $R_6$ ,  $C_6$ ,  $L_1$ , etc. — which refer to the original diagram inasmuch as these parts remain unchanged in both value and placement. With respect to the original circuit, it should be mentioned that the 6SL7 section of the unit requires no modification.  $L_2$  and  $L_3$  and

ity or intermittent operation of a VFO can frequently be traced to poor contacts in the plugs and receptacles used to terminate the interconnecting coax line. I have found that Amphenol type 83-22SP and 83-22R plugs and receptacles, respectively, used in conjunction with RG-22/U coaxial cable, provide the most reliable tank-to-tube connections yet employed.

— Donald Miller, W4VZQ

# NEW BOOKS

**License Manual for Radio Operators**, by J. Richard Johnson. Published by Rinehart & Company, Inc., New York. 480 pages, including index,  $6\frac{1}{2} \times 9\frac{1}{2}$ , cloth cover. Price, \$5.00.

A question-and-answer manual covering the eight elements of the FCC commercial operator examinations. Several appendices are included, one correlating examination questions with the normal progression of theory courses in the various subjects, a second giving specific references to laws applicable to legal questions, a third listing the Q signals, and a fourth tabulating general texts with a notation of their usefulness in connection with specific elements of the examinations.

**Introduction to UHF Circuits and Components**, by Milton S. Kiver. Published by D. Van Nostrand Company, Inc. 408 pages, including index. Schematics.  $6\frac{1}{2} \times 9\frac{1}{2}$ , cloth cover. Price, \$7.50.

Although the layman naturally thinks "television" when "u.h.f." is mentioned, the subject of u.h.f. television is discussed only in one brief chapter in this volume. The book is actually a survey of components, methods and circuits in the v.h.f.-u.h.f. field generally, covering tubes, transmission lines, waveguides and antennas used in this part of the frequency spectrum. Chapters on measurements and receivers also are included. Gives a good over-all picture of the field.

**Elements of Radio Servicing**, by William Marcus and Alex Levy, second edition. Published by McGraw Hill Book Co., Inc., New York City. 566 pages, including index. Schematics.  $6\frac{1}{2} \times 9\frac{1}{2}$ , cloth cover. Price, \$6.00.

In addition to the inclusion of new material on features of a.m. broadcast receivers that have been introduced since the appearance of the first edition, new chapters have been added to cover f.m. receivers as well. The text is general, dealing with types of circuits and methods rather than specific receivers. Test instruments and their proper use are discussed.

**Elements of Radio, Third Edition**, by A. Marcus and Wm. Marcus. Published by Prentice-Hall, Inc., 70 Fifth Ave., New York 11, N. Y.  $6 \times 8\frac{1}{2}$  inches, cloth cover, 771 pages, including index. Price, \$6.00.

Very suitable for the raw beginner, as well as useful to those who have some practical acquaintance with radio circuits and want to get an elementary technical background. The book is divided into two parts, the first of which teaches by using the development of the broadcast receiver as a theme, carrying through from the simplest crystal set to modern types. This section is entirely nonmathematical. The second part is an elementary theory course developed along more conventional lines. There are questions and problems with each of the forty-two chapters.

**How To Install TV Antennas**, by Samuel L. Marshall. Published by John F. Rider Publisher, Inc., 480 Canal St., New York 13, N. Y. 124 pages,  $5\frac{1}{2} \times 8\frac{1}{2}$ , paper cover. Price, \$2.50.

About half of the book is devoted to a discussion of TV antenna characteristics, transmission lines, and pointers in selecting the proper antenna for a given situation; the remainder deals with the actual mechanics of installation. Available materials and fittings are described, and considerable attention is paid to such factors as the stresses on masts and guy wires. Much of the antenna installation data appears to be useful for amateur antennas as well.

# Preview — DX Contest High C.W. Scores

Excitement reigned supreme during the 21st ARRL International DX Competition c.w. portions. February band conditions allegedly were the best in years. Then came March and Kennelly-Heaviside lowered the boom in a sudden about-face that dihard DXers have recently learned to expect. With claimed scores, multipliers and contacts shown in that order, here are the leaders in U. S. and Canada:

\* Multioperator station.

A complete report will appear in these pages as soon as possible.

# How's DX?

CONDUCTED BY ROD NEWKIRK,\* W9BRD

## Whom?

It's time we dipped into our DXtensive backlog of potential "How's" badinage and drew forth a sequel to our Pearl Harbor comments in last December's *QST*. You'll recall we inquired as to the identity of the DXer — DXer X, if you please — who was communicating with K6SRZ on 20-meter 'phone at 0700 Hawaiian time on the morning of December 7, 1941. This intriguing research project was initiated by W2TNC, K6SRZ operator at the time.

Well, the plot thickens, if anything. Though we didn't scare up the western W who held down the Stateside end of that historic QSO we did raise a casual eavesdropper who also heard the stick of bombs that overloaded K6SRZ's modulator one fateful Sunday morn over thirteen years ago. It was W7GAT, then news chief of the weekly *Oregon Statesmen* (Salem, Ore.) and now publisher of the Mount Vernon, Washington, *Argus*. Steve swells to a grand total of two the number of persons who heard one of the most momentous transmissions in ham history. We excerpt from a yellowing page of the special *Statesman* extra dated that December 7th:

### Hawaiian Ham Tells Salem Radioman of Things Amiss

"This looks bad! I can't stay in this place!"

An excited, doubtless frightened, voice spoke those words over the 20-meter radio band Sunday forenoon, tipping off [W7GAT] that something was amiss in the Hawaiian Islands.

"Can't talk anymore," the voice said. "Signing off — you take over."

Then the Hawaiian operator shut off his station and a Salt Lake City amateur responded: "Okay, but you didn't say what was the matter. 73 . . ."

No time to polish the doorknob on that QRT! This clipping considerably narrows the search for Station X — beyond much doubt he was a W6 in the Salt Lake City area. But where is he now? What part, if any, did he later play in the hostilities he so dramatically heard begin? These questions and others may never be answered, for Station X seems to have vanished into the past along with the lost logs of old K6SRZ.

-----

Bouncing back after May mayhem at the hands of DXHPDS antagonists, W6MUR disturbs us with excerpts from his latest treatise on avocational communicational diseases. The following ailments are identifiable with DX hunting in particular:

**Operational Turpitude** — A contagion resulting from excessive exposure to DX contests.

\* Please mail all reports of DX activity to DX Editor Newkirk at 4128 North Tripp Ave., Chicago 41, Illinois.

**Figmentary Impotence** — Frustrating inability to raise the "easy" ones in DX contests.

**Immedicable Perpetuophobia** — Screaming mimies as a result of agitation through immersion in pile-ups.

**Mental Plausibilianism** — Reflexive log entries made when rare ones come back to people with calls like yours.

**Radiational Astigmatism** — A strange malady that causes its victims to answer directional CQs of any and all types.

**Flatulent Amphigoria** — Cultivation of a permanent sneer brought on by DX column flashes about DXpeditions to HV, ZA and Northeast Dontundustan.

These afflictions have several symptoms in common — glazed eyes, twitching elbows, desultory mumbling — and accurate diagnoses are difficult. Beyond all dubiety the DX Bug is secondary host to the infectious parasites involved. Beware!

## What:

20 c.w., now frequently open around the clock in northern latitudes, gives evidence that better days are at hand. DL4ZC's noncontest 19-minute WAC with VK4YP, LU1AR, JA7AD, DJ1ER, W4PVD and FA3OA in late May is a tantalizing sample of what we can all anticipate from the rising o.u.f. Lloyd also worked FB8BE, KG6AFY 12, LU1ZV 21, a UF6, ZDs 6EF 18-19 and 9AB 18 . . . HZ1AB QSOd AP2Q 11, CT2AF 17, DU1NL 15, EA6AU (35) 13-21, ET3LF 12, KT1EX 11, MP4BBL 16, a UA4, VK9AU 12 and VQ3CF (74) 13-15, plus dozens of W/K pursuers . . . GM3AIM (43) 21 of the Hebrides, representing a rare entity on DARC's WAE List, came back to W2FJH. Len will linger there until September and then return to G3AIM in Liverpool . . . CR4AF (20) 0, HA7KLD (37) 21, HI8WF (17) 23, JZ0AG (98) 15, KJ6BG (46) 3, OYs 2Z (63) 22, 7MIL (68) 22, TG9CR (79) 23, a UB5, VK9RM (65) 13, VP1FL (25) 23, VSs 2DW (57) 16, 6CG (20) 13, 6DD (44) 12, ZDs 2DCP (87) 21 and 8AA (3-100) 22-0 worked W9TCY, son of equally enthusiast DXer W9RMH . . . K6ENX found conditions to Europe much improved and nailed CE7ZJ (40) 15, CX2BP (5) 1, CP3CA (50) 2, FASZZ (30) 21, FO8AL (40) of Tubuai isle, LU7ZT (40) 2, a doubtful OD5AB, PJ2s AI (60) 15,

Sunspot numbers again soar upward, north Atlantic propagation paths become more solid day by day, and it won't be very long before S9-plus Europe-U.S.A. QSOs are the 14-Mc. rule rather than the exception. OZ2KR, I1ER and CT1CO, pictured here from left to right, are among the Continental DX crew who look forward to "the good old DX days" revisited. All three are OTs; I1ER, especially, for Mario recently completed his 30th year as an ARRL member. (Photos via WØ1VFM)

AR (50) 0, TF3AB (50) 0, VSs 2EI (90) 16, 2EM (40) 16, 6DB (40) 15 and YU2JJ, VU2CY, ZC2PJ (45) 14 and ZM6AS escaped. . . . W4TBP, now at the 100-confirmed mark, associated with CP5EP (1) 20-21, EAs 8BII 9AP 19, 0AC 23, GC3EBK, HA5KBB, HZ1AB (40) 19-21, LZ1KAB (40-66) 19-21, OX3UD, Swede SL3AG 17, TF3MB, SP5AA 22, VQ4EM, ZB1AY 20, ZC41P, ZP9AU 1, 4X4s BX DC 23, FQ 22, 9S4BN, G3IRL who is *not* a YL and G13JM whose name is Jim. . . . GD3UB (32), MB9BJ (59), Y12AM (75), ZC4GF (35), 3V8SC (72) and 4X4BR swapped sigs with W1BFB. . . . FASRJ, HA5BL (20) 19-21, HK4BD, HR1MC (88) 3, IIBLF of Trieste, ZBITNE, 4X4s FS (45) 23, IE, 9S4s AX (51) 22 and BE (11-64) 12-20 brought KDSW to No. 51 and WAC. . . . W6NHF/4 caught CE7ZT, EAs 8BF (45) 18, 9DF of Rio de Oro, FM7WP, FY7YB (40) 23, HA5KBN, HZ1HZ, OQ3GU, SVLAB and VQ2HR with modest input

Fortunates who hooked ZD6BX recently are ET2PA 19, KC6GU, HK6AF 13, KR6s MC 13, OY, KT1EXO 17, MP4QAL (62) 16-20, SV0WZ 19, TF3AR 18, a UB5, VQ8CB (100) 12-17 of Chagos, VSs 1BJ 2EL 6CL 9GV 14-15, W4DGW/OQ5 9, W6JMX/KG6 13-14, XZ20M, ZB1s IRK BF 18 and ZD4BM 18. . . . ZC2BT took the measure of GC3KAV (52) 0, HA5BL (17) 16, JA6AO (45) 13, KASAB (33) 15, MP4JO (40) 20, SP8KAF (27) 19, VP5DC (10) 16 of Turks, VQ3FN (77) 23, YQ3GY (45) 22, 3V8AB (35) 21, 4X4s KC (80) 23 and FK (70) 23. . . . KR6OO, LX1RB, FG9AQ, ZD3A (61) 22 and ZP5GM got away from W1OJR, but HK6AI (190) 1, K2AKS (55) 12, VQ4FK (70) 6, GC LZ and OY customers didn't. . . . WSKAAT pinned down a Qatar MP4, LUSZS (76) 23 of So. Shetlands, ST2AR (55) 20 and ZB21 (60) 22 while friend W8APM, lately returned to the DX fold, practiced on an OY, FB8BB and VSAL. . . . W3TYW managed CN8AF (16), HA5BB (13), SPIKAA (16), TI2FCG (73) and a GC, LX1DU (42) and 0, HA5s BU (72). BW (40), KG1AA of Thule, VP5BM (10) of Turks, VQ4FM, ZP6CR and gadabout EL2X keyed with W4ZAE. One YZ1AZ. . . . "QSL via FB8CZ?" puzzles Mike. . . . FASBS JAs 3AB 15-16, 6AD 15, 9AA 15, PJ2CK 18, AE1UU 14 and YN1KK encountered W9VFM of Davenport.

. . . 14-Mc. c.w. doings at scattered shacks, first W1WAI: EA6, KT1UX (55) 23, YS10 (8) 0, YS6, ZP, W4GCB, CR6CW, PJ2s AE CC (80), SP, VP, W5AQ/2: SL7AG of the Swedish military, W6C4Y: DU7SV (89) 13, KAs 2FEC 2USA 9MF, KR6LX, YN1PM, W6IWZ (40), HK6, KA2MB, VP6RC, W6NTR: KC6AI (16) 3 of Uthiti, W6UED: KA3s MD 3, WL 3, KG6, VS6, K6AAJ (W6LDD): VS1EW (62), K6DVB: JA3AF, KR6USA, AE1OX, W7JLU: YN, ZP5AY, W8PCS: FG7XB (90) 22, SV, ZB2, W9EUV: BV1US, KA0JJ of Iwo, KC6CG, VQ6LQ, VU2As, W9KXK: EA9, FF8AJ, FG7, HK9, VP8AQ. . . . West Gulf DX Club DX Bulletin 20-meter code notes: AC4OK (6) 21-22, Cs 3AV (40) 21, 8GA (3) 0, CE7ZJ (22) 14, CRs 5AA (3) 21-22, 6CZ (46) 21, 8AB, DU1s GT (90) 13, SCS (82) 13, ETs 2AB (60) 1, 3GB (10) 18, 3S (12) 20, F9QV/FC (33-75) 18-1, FD8AB, FF8AP 8, FK8AH (62) 4, FY7YB (50-70) 23-0, GC2EFC (17) 13, HA2KTB (42) 19, Swiss military-bam station HB4FE (40) 17, HE9LAA (50) 21, HH3L (1) 21, IS1AHK (4) 17, IT1TAI (29) 22, JA6CA (42) 16, KG6AFX (119) 15, KJ6BB (38) 5, LZ1s KDP (57) 23, KSP (47) 17, MP4s KW NL, OYs 2A (30) 14, 2H (47) 12, 4A (35) 18, TFs 2WAB (38) 19, 5TP (41) 16-17, VKs 1VH 9WB (52) 13, VP8BB (82) 2, VQs 4AQ (18) 20, 8AG, VR3A (78) 6, VSs 2BJ (25) 14, 2EI, 5CT (87) 14, 6CT (70) 13-14, 6CW (120), YN1AA (18) 3, YOs 3RF (64) 20, 3ZR (64) 21, 4KCA (71) 18, ZCs 4GF (48) 21, one 6AA (59) 23, Z6J3U (87) 13, ZS3LD (62) 19-20, 3V8AN (64) 19, 4X4s GW (110) 19, GZ (86) 14 and II (77) 20. . . . YJ1DL (10) 6, HZ 1CC (75) 18 and M1H are in high demand.

**20** phone circumstances are equally DXhilarating. W1YOU needed only a TBS-50D (40 watts) to raise CS3AC of the Azores, FA3KC, FF8AP, GC6GF, GD6IA (153) 21, HH3DL, KS4AW, OD5AF, SV0WO, TF2WAF

(215) 21, ZB1JRK, 3V8AS (177) 18 and 4X4FK (130). A Telrex 2-el. spinner is no hindrance. . . . EA9AR (132) 12-23, FA3ZH 8, FR7ZA 6, I1BNU 9 of Trieste, VQ8CB 12 and a bunch of W/Ks came back to HZ1AB with little reluctance. . . . W8PCS knocked off VP1SD and YN4CB while awaiting his WASM award. . . . HZ1AB (328), KG1AA (202) 3 and KM6AX (250-275) 4 entered W9WHM's Indiana archives. . . . GC3EBK and the aforementioned HZ1 were welcomed by K2BZT. . . . TF2s WAG (130-160) 18-20, WAH and ZM6AT (140-160) 3-8 QSOd W1YWU. . . . KG6AK landed Formosa's BV1US (ex-AB1US) whose 100-watt frequently haunts 14,250 kc. . . . KL7FAF speaks of poor Alaskan 14-Mc. conditions in one breath and of QSOs with FA3GZ (121) 19, JA3HD, OD5AA (125) 21, TF2WAB, VQs 2DC 4FK (120) 22 and 5A2TZ (170) 14 in another. . . . VK4IC 7 of Willis Islet and VS5CT (130-190) 14-15 interested W6SYG. . . . AC4NC, CR5NC (161) 21, CT3AN (175) 21, DU7SV (193) 12, EA9AR (132) 23, ET2s XX (184), ZZ (145) 19, FF8AK (105) 15, IH6EC (175) 1, HK6AI (169) 1, KA0IJ (251) 7, KC6s CG (215) 13, UZ (237), K6IFR (245) 1 of Greenland, KJ6s AF (280) 13, AZ (227) 6, BG (225) 7, KM6AX (250) 4, KR6KS (279) 7, KX6s AF (285) 13, BU (230) 8-14, M1R (126) 18, MP4s OAI (200-205), OAM (150) 17, OK1MB (170) 0, OYs 3FF (110-160) 8, SML (160) 22, PX1YR, SP3WF (196) 21, SV0WM (100) 17, VL1VH (137) 7 of Macquarie, VK9s DB (124) 14, EB (122) 8, GV (143) 14, NF (183) 14, OK RH (122) 5, VP1OJF (177) 1, VQ4AQ (135) 19, VR2AP (170) 7, VS1s CZ (137) 15, FK (121-195) 15, FS (47-109) 14, VS2s BN 12, DB (170-190) 14-16, DN 11, DY (185) 17, DW (145) 15, GM 11, UW 11, VS6CL (156-174) 12-13, Y12AM (75) 19-20, YQ3GM (210) 21, YU1AD (165) 13-14, 457s ZD2s 2B (110) 21-22, 8AA, ZS2ML (165) 13-14, 457s EG 17-19, LB 17-19, MP (160) 13-14, 4X4s DK (159) 1, GB (120) 17, 9S4s AD (225) 22, HX (175) 20 and other A3 specimens are recorded by GDXC conferees. . . . *Network News* Radio Club tuners tuned in CN2AD (105) 20, CRs 4AF 16, 6AG 6BX, CT2AG (115), EAs 6AF (85) 20 of the Balearics, 8AI 8AF, 5, 8CB (230) 21, EL2X, ET2US 19, FAs 8BG 9WD 21, FM7, WZ 22, WF WQ, FQ8AK 22, FY7YE 22, GD3s IBO (120-255), UB (140), HB1MX (155), HH2RM, HH6CP, JA4BB, KA2AK (150) 18, 20J, 2SM (100) 23, 2YA (200) 22, 5MA 5SD, KC6AB, KG4AF, KR6AF, KTIWX, KV4s BB BD, MP4QAD 21, OASB (135) 0 in the Peruvian Amazon, OQ5s DX FA (125), RL TE, OX3AY (130), OY2Z, PJ2s AF (183) 18, AK AP CA, SP9KAL, SU1AS (130) 18, SV0WS, TA3US, TF3EA 14, TG9s MB RB (190), VK9FK 12, VP1s BS (192) PX, VP2s DC DL DN GW (155) 20, KM VA (190), VP3LF (195), VP7s NE NJ 21, NK (190) 2, NSNX, VP8s AQ BD, VQ2s DQ (120) DT 23, FU, VQ4s ERR EZ JB (135), MZ 20, RF SK, VU2AL 21, XZ2ST 14, YN1s RA WR, YS1s CB (290), MS, YV9AP (150) 21 in Venezuelan Amazon, ZBs 1CM (170) 1GBF, 2A (110), ZDs 3BFC 18, 4BF 22, ZM6AT 4, ZP5s CG 1B, ZS3AH, 3V8s AP CS, 4X410 (240) 5As 2CL (150) 19, 4TU (120) 13 and several 9S4s. . . . Here's a good spot to remind you single-sideband specialists that "How's DX?" is for you birds, too. QTC? QRV?

**40** c.w. keeps a flock of DXers happy. W7JLU had a ball with DU1SCS (20), KG1AA (15), KR6LJ (20), OX3AY (25), VK9PF (35), VS6CQ (1) and one ZL1A. . . . VS7ZE, HIR1JZ, KC6CG, KR6KS, KV4AA, VP7NM, VSZAE, a pile of VKs and JAs tried out G6EBB's 811. Don reports JA3 ISR and 7B0 as having standout signals among thirty Japanese nationals logged. . . . From the other end of the country W3WPG suggests EAs 6AF 9AP, FASDA, OE13USA, VQ5EL and 9S4CH, reaching 77/66 with an 813 final coming up. . . . It's 106/88 for W1WAI, in part because of IT1TAI (5) 1, TI2CAH (1) 1, VPJs 2SH (22) 0 and 6RG (40) 0. . . . DU7SV, JA1AJN, VKs and ZLs in number conversed with W5CAV. . . . The ground-plane and 150 watts of W5WZQ flagged down EA9DF JZ0DN, KC6 KR6, VP6 6GC 7NX,

ZS3HX, as well as JAs 1GS 1NI 2LC 3AF 5AB 6FC and 8AI. Those Japanese DX men really get around in quantity on 40! W9VBS found a plains QTH good for HK4DP, KG4AV, TI2s BX PZ, VP7a NG NM, ZL1BY and a helping of KH6s. . . . Now a perambulating perusal of 7-Mc. c.w. doings hither and yon, at K2DSW: KH6, OE, ZL, K2JWZ (now K2JWZ): KV4BK, K2JZR: IT1, YS10, YU3s ABC AJK DJK, K2JKC: KV4, OE, K2JAN: CT3AB, Europeans, WN3ZUH: KH6AUJ, W1TFB: KG1, VKs, YU2AE 2, LUSZC 7, K6ENX: F9QP on ship off F18, JZP, KR6, ZEGJF (30) 4-5, ZSs, W7VWS: JA1VP (40) 16 who switches to 'phone during c.w. QSOs, KH6 KL7a AQU AZI BAK BK1, W0UOL: KG1, LU, PJ2AE (50) 7-8, PY, VK7, DL4ZC: Ws 1ADM 2TQC 3VAN 4UXI 6VUP 8GMD, ZD6BX: long-path W6s, W7s, ZS7D 16, HK4ZCers: FG7XB (32) 15-16, VK9RH of Norfolk, and ZD2WAF (ex-ZD9AA) 0.

**40 'phone**, as a DX band, leaves much to be desired. So, having made the understatement of the year, let's see what NNRC's redoubtable eavesdropper uncovered in the way of 7-Mc. A3 DX: F08AQ, HP3FL, HR1BG, JAs 1AEV 1DG 3BU 3KE 3MB 4XF 6BL, KH6s in quantity, KV4AQ, VKs 6MO 9RM, VPs 1LJF 3HAG 6WR 7NY, XZ2OM, YS1MS, ZS6AR and enough Australian and New Zealand stations to run you out of QSL cards. . . . Attention is called to the fact that 40-meter 'phone suballocations are quite various around the globe (e.g., check KC6AA's "Whence" comments to follow). You don't just tune off the low edge of the FCC-specified Yank 'phone band and expect to log the world. For the general pattern of world-wide amateur band suballocations, including 7-Mc. 'phone, we refer you to the full-page chart in the current edition of ARRL's invaluable *License Manual*.

**80 c.w.** and its kin 160 have, for most practical DX purposes, been given back to the Indians, traffic men and rag-chewers for the summer. Eighty always dies hard, though, and W7JLU latched onto JA7BO, KG6GX on voice, KM6AX, KZ5DE, ship SM8CWC, VK9RH (12), VP7NX, VS6CQ (3), W6TMY/KG6, YV5BJ (9) and ZK1BG (18). . . . K2HZR found the European path still open for EIs and PA0s, while friend K2JKC bumped into KV4BK. . . . DL4ZC reports QSOing big signals from Ws 1WLW 2GGL 3AXT and 4KVX through the rash of static crashes.

**15 'phone** comes next on this month's Bandwagon and W4NQM gives our vehicle a good push with CE3II, CN8CS, CP5EQ, CRs 4A1 6BH, CX5AF, EA9AZ, FAs 30A 8RJ 9ML, HII2W, HK4DF, HRIKS, KT1a ENO WX, OK1KAI, OOs 5CJ 0DZ, SV0WO, TA3US, VOs 4EU 4EZ 4RF 5EK, YN4CB, YS1RA, YU1GM, ZB1JRK, ZP5AM, 4X4s DK and FQ to reach 85 countries on 21-Mc. A3. Sparky also worked acads of Europeans, ZSs and Oceanians—few dull moments these days on fifteen! . . . W4WVM clicked with 57 ARRL DXCC Countries List items in just four months with 30 watts: a CR4, EL2X, VP7NG, YV5EW, ZL3FP and a 4X4 assisted. . . . Fifteen's faithful W6ZZ reports an entertaining mixture of short and long skip, the latter helpful toward KH6s AFS AIW BIM ZA, KV4BD, KZ5s a-plenty, OA4M, TI2RX, VP6FR, XE1OE, ZLs 1BY 2AJB 2AX 2SO, maritime-mobiles operated by Ws 1KS 2WAT 3OZA and 5EWS. Miles, ex-W1WV, now is 68 years young, a credit to ham radio for many years. . . . EL12A, OA3L, OQ5RU, PJ2AR, VP6GN, VQ4EZ and other catches swell the records at W4UWC. . . . W6NJU collected a CPe5,

HR1, TI2, VP1, VKs galore, VP7 and YS1RA (250) 21 but 21-Mc. voices. FAs 3JY 9VN, HC1s GE WG, HP1FS, KG4AG, KV4BB, KW6BB, MP4NL, OA5G, OQ5AI, PJ2s AP CD, SV1SP, VPs 2AD 4LL, VQ4ERR, YV5EC, ZBs 1AUV 2A, ZD2FHW, ZP5IB, ZS3G and 4X4BG are accounted for by NNRC informants.

**15 c.w.** gets short shrift now while DX comes so easy via radiotelephone. W1CTW soaked up EA0AC and SV1AB around suppertime to make it 68 21-Mc. code countries. Cal also corralled Ws SHZA (W. Va.) and 9TJG (Wie.) to close out his 15-meter c.w. WAS. . . . Novice DXer WN4GSM traded RSTs with CN8AF, Fs 3AT 9VK, FASRJ, G3AET, KZ5LB, LU9DAZ, PY7DN, VP9BL and ZB1AY. Terry's Virginia 30-watter holds its own with the Generals any old day.

**10 'phone** now delights the short-skip gang mainly but there are DXers hereabouts poking through the E<sub>s</sub> successfully. Scattered 10-'phone reports, thanks to W4NQM—K24JN: CX6BBM, LU3AY, K24JD: CX4AB, HC6KI, HR4WH, LU8s DDI EJ, TI3LA, K2FFB: CX2s BP GE, PJ2AP, WZ2AS: TI3LA, W6ESE: HP4FL, LU8 3AAT 5DC, W3POG: LU8, PJ2, W5V5U: PJ2AG, YV1AU, W6CNY: CE2BQ, CXs 3BT 4CS, LU8 1CM, 2DA 2DED 5DBN 6EX 8AM 9DBA, OA5G and PJ2AO. . . . CR6BX and ZS6ZK spoke with W1YWW, and we note that W9RVB's 65-watter and 3-el. c.s. rotary are close to the 1955 10-meter 20-country mark. . . . HP2TP partakes of 2S-Mc. c.w. sport—rare sport, indeed—encountering K24JD and W3HTF thereby. On which weird note we leap off the Bandwagon for this month and peek into the postbox to see what's cookin' in the QTH department. . . .

## Where:

From ubiquitous Bob Roberts, G2RO: "I have just completed my last and longest tour of this series and cards have been ordered from the printer. Everybody contacted will get one in due course. Calls covered are VR1RO, VR2RO, VL0RO (Nauru), VR4RO, VQ8AY and ZC4RO. It may be worth mentioning that VQ8AY is my own issued call and not a borrowed one as some have thought. Authorities could not give me VQ8RO. . . . VU2JP gives assurance that QSLs bound for VU AC3 and AC4 areas will be relayed via Box 1, Munnar, Travancore, India, as usual even when he's traveling or on U.K. furlough in Scottish highlands. . . . Regarding the VPIGG address run last month, QSLs will be held by VR2AS pending ex-VPIGG's arrival in Fiji after completing leave in the British Isles. . . . We learn from W6LTY that VK9DB assumes manership of Papua Territory QSL matters now that VK9GW has returned to New South Wales. . . . "The MARTS QSL bureau has been extended to include the areas of VS1 VS2 VS4 VS5 ZC2 ZC3 and ZC5. Anyone wishing to QSL amateurs in these areas should send cards to MARTS QSL Manager, P. O. Box 600, Penang, Malaysia." This info from K6GAK after a recent QSO with VS2DQ. . . . W1YOU correctly believes we should reaffirm here that a QSL card *not* enclosed in an envelope now can be sent anywhere in the world via air mail for ten (10) cents—provided it is no smaller than 2¼ by 4 inches and no larger than 3¼ by 5¼ inches. . . . ZD4BT, via W1WPO, asserts that quite a few incoming QSLs have gone astray and suggests that amateurs whose return ZD4BT pasteboards are long overdue reply to the corrected address that follows. . . . Don't fret and fume if you lack the QTHs of any KC6s you

For our QTH of the Month we present the back yard of OE5AH at Drachenwand u. Plomburg, Mondsee, Austria. This Gibraltar-like "Wall of the Dragon" blocks off OE5AH to the west—"No South American stations heard here since 1953." OE5AH is operated by Austrian Archduke Anton Habsburg, better known to prewar DX hounds as OE3AH. Anton is quite active again with p.p. 807s driven by an IIT-18, and HRO.

work. KC6AA reiterates: "Any and all KC6 QSLs can be sent through me." . . . . . Although VR3A is to remain active on Fanning until the fall he requests that, as of now, QSLs for him be mailed to the Australian QTH to follow . . . . . Reminder: In our monthly address rosters, such as the one to follow, we strive not to duplicate QTHs available in the latest *Call Book*. Also, addresses that are at variance with W9TRD's listings for identical stations do not necessarily indicate either "How a" or the *Call Book* to be in error. This is because DX stations often adopt box numbers, etc., to facilitate collection of mail while their station-location addresses continue usable. W1s JLN SSZ UED WPR ZDP, K2GMO, W4NQM, W5WZQ, W6s LDJ NIF/4 NTR, K6a AAJ ENX GAK, W7JLU, W8LMO, W9a CFT EU FGX RMH, W0s CPM QGI VBS, VS2DB, ZD6BX, NCDXC, NNRC, SCDXC, WGDXC and member societies of the International Amateur Radio Union unearthed these individual items for you:

## Whence:

Asia — Because Afghanistan remains on the rarer side these words from W9ERC in Kabul should be of interest: "In the present [new] QTH there'll be room for a 7-wavelength beam on 20; but, if anything at all, I'll have only about 10 watts to a 6V6." That will be all he'll need! "We're expecting a couple of Globe Scouts at Afghan Institute of Technology and, since I'm teaching a radio course this year, we will have them on the air quite a bit. The fellows know no code so we'll be on 'phone.' The time appears to be approaching when YAs will be available in number . . . . . W9EU was the first W contacted by VU2AS who likes 20 c.w. with an 807, BC-348 and dipole . . . . . W1YOU notes that OD5AF-MP4QAJ signs G3HEH when in England . . . . . MP4QAL tried low-level modulation on his 120-watt 807s rig "with horrible results." He has a ground-plane, a 300-foot long-wire, an Eddystone receiver and likes most of all to work his pals back home around Dublin town . . . . . W1YEH, just back from Japan, left W1TTA in charge of the KA8AB BC-610E, W5A-3 and 3-element rotary on 20. W4LPI is quite active as KA2DC . . . . . W6CRV, who leaves HZ1AB next month, bears down on the 100-country mark in his Saudi Arabian efforts. Surprisingly solid openings to W6 and W7 spiced up Ron's recent activity. "QSL situation still rough — the 300 from OE13USA are gone now; 900 [from the States] still have not arrived. I Mimeographed 100 but they are pretty sloppy. Sending them out, anyway." . . . . . We also hear from W7YBI/0, one of HZ1AB's former operators, who was delighted to note that "Hot-Ziggity-One-Affectionate-Bachelor" still cracks away at 14 Mc. Other HZ1AB ex-ops, W9ERG and W3ZCG/5, are attending Purdue U. and serving with the USAF at Keeler AFB, respectively. W7YBI/0 regularly operates K9FDV and has applied for his own W7 ticket in anticipation of a future North Dakota-style DXCC . . . . . The Massachusetts OD5 who specializes in baiting W5s is closer to the end of his rope than he realizes, says W1SSZ . . . . . From VS2DQ via K6GAK: VS5CT has ordered QSLs but is deep in the Brunei jungle with an oil exploration party. He will QSL 100 per cent but doesn't expect to be shipping out cards in quantity until late this month . . . . . FEARL (U. S. nationals in Japan) contemplates a KA DX contest to be scheduled for August or September. It will be a single week-end affair and we'll pass along the dates as soon as they are selected . . . . . 4S7LB, off the air awhile rebuilding, tells W6RW that CR8 activity is becoming noticeably less frequent.

Africa — ZD6BX now is up to 131 worked "in spite of poor conditions. ZD6EF runs 100 watts to a long-wire, mainly on 20 c.w. at present." . . . . . "Please cancel all rumors of VQ4NZK as VQ9, Seychelles, Geo. still is in Kenya

The city of Damascus, believed to be the oldest continuously-existing community in the world, turns out to be a pretty fair radio QTH as verified by the 'phone signal of YK1AA.

Radiotelephone work is preferred by 3V8AS. Alfred's equipment is homespun for the most part and his Bizerte station now is a North Africa landmark on the twenty-meter band. (Photo via W1WPO)

EA9DF is kept very busy representing the Spanish Africa territory of Rio de Oro on DX bands. Cesar does a fine job with the 50-100-watt 'phone-c.w. rig at left. A scrupulous QSL policy is maintained at EA9DF. (Photo via W1WPR)

and is very busy making movies." This from VQ4ERR who promises there'll be ample warning when and if VQ9NZK fires up. . . . . ZS5JY doesn't expect to raise his much-publicized tower for a year or so, according to W4NQM. Don't forget to add "Natal" to the ZS5JY QTH appearing in the *Call Book*. . . . . Mozambique amateurs now number some 70 strong. CR7s AC AE AI AK AZ BL BN CV CY DA DC DG DM DI DK DL DN DO DR FM HG and MG are among new licenses reported by IREM. . . . . The South Africa city of Pretoria celebrates its 100th anniversary this year. SARL secretary ZS6AMO writes: "To mark the occasion, members of the Pretoria branch of the South African Radio League have prepared special QSL cards to be issued in addition to their regular cards." So, for a collectors' item, go raise yourself a Pretoria ZS6 at once. . . . . "VQ3EO is off the air. I will probably be VQ4EO during May and June. Many thanks to the 1300 U. S. stations — particularly W1JNV — who helped me spend the long evenings in the bush." Ex-VQ3EO, who still has a stock of Tanganyika pasteboards on hand, can be reached care of Macalder Nyanza Mines, Private Bag, Kisumu, Kenya.

**Oceania** — From KC6AA of Yap, Western Carolines: "Would like to remind the DX gang that KC6 stations do not work the same frequencies on 40 that Stateside DXers work. Our 40-meter band is 7000-7150 kc., 7100-7150 kc. for 'phone. I work 40 almost exclusively and always tune the Stateside 'phone band when working 'phone. KC6AA can be found almost nightly on 7116 kc." The areas compassed by the Eastern vs. Western Carolines are somewhat tricky to determine. The Eastern Carolines appear as just "Caro-lines" on most maps and this may account for the difficulty. Knowing that Truk, Ponape and Kusaie are in the Eastern Carolines, and that the Palaus, Ulithi and Yap are in the Western group should help keep the bearings straight. . . . . W6NTR finds that KC6CG on Ulithi is W6MFF in rare-DX clothing. KC6CG has a Viking II at the input end of a 14-Mc. ground-plane. . . . . DXers of several continents are busily persuading YJ1DL to forsake 40 for 20 meters. . . . . KC6s ZB and ZC take a dim view of KC6HX or KC6SDX on "Mays Island". . . . . W5LCI, who recently wangled a VR6AA QSL for a 1947 'phone QSO, advises that VR6AC has a new receiver and hopes to be working 20, 15 and 10 meters in the near future. W5LCI's Pitcairn confirmation finally came about through correspondence resulting from Jim's recent contact with a bogus VR6AC on 14 Mc. This time it paid to work a phony!

**Europe** — The experience of HB1MX points up why DX stations rarely QSL first these days. Kurt's Liechtenstein operation resulted in nearly 2000 QSOs with 91 countries, 852 contacts with the U. S. A. Only one out of every ten U. S. stations bothered to answer his cards and just three out of every ten non-U. S. stations replied, according to F7ER. . . . . "Present 3A2 activity is entirely confined to local 'phone work. The only DX activity from Monaco occurs when some DXpedition-type station gets on the air there. Such activity is usually announced in advance through proper channels. Ergo, any 3A2 activity (particularly on c.w.) that pops up unannounced should be viewed with dark suspicion, to say the least." These words from OT DXpediter W6SAI-FP8AC-3A2AF-7B4QF who noted that his 3A2AF call recently was borrowed for 14-Mc. use by some unscrupulous individual. Bill adds, "Come the peak of the sunspot cycle, I hope to polish off some spots like 3A2 PX and HV to everyone's satisfaction. As you know, the main requirement for a DXpeditionary man is a strong back and a weak mind." . . . . . Two-letter Irish calls become reality with the licensing of EI3 2AB and 3AB. . . . . EI6U and TF5TP scored the first EI-7F 80-meter

QSO in history. Icelandic amateurs are authorized to employ 3.5 Mc. this year and from now on, so there's another multiplier available for the annual ARRL DX Tests. . . . . W6RW received a reception verification from Albania's *Radio Tirana* in response to his QSL to ZA1BB. . . . . A flyer bearing a list of British Commonwealth and Colonial Empire call areas, plus descriptions of RSGB operating awards based thereon, now is available from RSGB Hq. and should quickly answer general inquiries concerning WBE, BERTA, et al. . . . . W1BB's *160-Meter Test Bulletin* tells how YU1GM's 80-meter folded-dipole collapsed and threw a good chunk of Belgrade into darkness by shorting power lines. . . . . DXers of the old school will be glad to hear that DARC (Germany) is reviving an old top-favorite DX contest — the annual DJDC. It will be known instead as the WAE DX Test and is tentatively scheduled for September 17th-18th (c.w.) and September 24th-25th (phone).

**South America** — From HC1ES, ex-CP5AB: "I have started operating on 21 and 14 Mc. and will shortly be active on all bands, 28 through 3.5 Mc. My previous call, CP5AB, has been cancelled but I still retain my Argentine call, LU9DBF." The new HC1ES uses a BW-5100, a 75A-2 and folded dipole antennae. . . . . FM7WN won't be back from France until September and FY7YZ is n.g., according to FY7YE. . . . . W6NIF/4 points out that the LUSABL 400-watter needs only Nevada to complete a 14-Mc. c.w. WAS. . . . . In the *Circular Letter*, the G2DPY-edited organ of the First Class Operators Club, we see that well-known DXer G5RV soon will commence a three-year South American hitch as YV5RV. . . . . Argentine Antarctica QTILs courtesy SCDXC's *Bulletin*: LU "Z" calls ending in A G and M are on South Orkneys (Laurie Island base); C I O S T on South Shetlands (Deception Island and Bahia Luna bases); and B D E F H J N P Q U V on Grahamland, Antarctica proper (Bahia Esperanza, General San Martin, Almirante Brown and Melchior bases).

**Hereabouts** — VP4BN's DX career goes 'way back through these calls: Ws 3JMG 4RHC 6BRZ 6TPKC, KZ25NA, KA1BN, XU5 1BN and 8BN. . . . . W6NIF/4 terms Florida a DX paradise in spades — Al picked up 85 countries in less than three months with 35 watts. He hopes to land a short tour of Grand Turk or Caicos duty before heading back west. . . . . Potomac Valley Radio Club efforts lead by W3JTK, W3RXD and W3VOS sent off 728 HK0AI QSLs via bureau channels. — *W1ZDP*. "Believe it or not, I prefer to be 'just another W'! All joking aside, it's nice to be back home and I still enjoy the thrill of competition." This from indefatigable DX hound W4VE, ex-KR6AA-KA9AA. . . . . HR4WH, licensed in October of last year, already has built up an excellent reputation in the QSL department and is rolling up quite a DX tally of his own. . . . . DX stations needing South Carolina are invited to set up 20-c.w. skeds with W4GCB. . . . . Iowan W9QGI reports confirming 100 ARRL DXCC Countries List items worked with a 2E26 at 30 watts. . . . . From W8LMO: "VP5AE has gone QRT and I am returning to the States for reassignment. The Turks and Caicos continue well represented on the ham bands by VP5s BM and DC. Anyone who did not receive his VP5AE card should QSL to W8LMO's home QTH." . . . . . W8s must be succumbing to conscience: K6ENX finally received a W8BHW QSL confirming their 7-Mc. QSO in 1940 when they were XUSM1 and W2BHW, respectively. W8BTI, another Ohio DX-deliver, just got around to answering the 1941 QSL of W9BRD. [One less state to go for WAS, Boaz! — *Jeeves*]. . . . . W2QHJ obtained his 100-meter WAS endorsement from Hq. to batten down his claim to the first and only six-band Worked All States certificate on record.

## New Apparatus

### The Model 587 Audio Bandpass Filter

NUMEROUS ARTICLES in *QST* and other publications have pointed out during past years the advantages of restricting the speech range of a phone transmitter. On a.m., reducing some of the low-frequency response can save modulator power and actually add to intelligibility. In s.s.b. rigs, restricting the audio range "protects" the audio phase-shift network and results in better side-band suppression, and it eases the burden on an exciter using a filter. A number of designs in the past have shown a filter or other device for restricting the audio range of a speech amplifier for the reasons outlined above.

The operator who has always wanted to try an audio filter but is reluctant to dig into the rig to install it will be interested in the Model 587 Audio Bandpass Filter. This small unit is designed to go in the microphone cable between microphone and transmitter, so no work is involved outside of making the connections. The input side of the filter has an Amphenol microphone jack that takes the usual connector, and the output side is a 5½-inch length of microphone cable terminated in a microphone plug. The only time you might have to modify anything is when your transmitter is fitted with something other than the Amphenol microphone jack, but even then it is easy to rig up an adaptor.

The filter itself is housed in a 1¼-inch diameter metal tube 4 inches long, so it doesn't take up much room on the operating desk. It is designed to work only with crystal microphones, and because such microphones represent practically a pure reactance, the filter has practically no insertion loss. This means that if the gain of your speech amplifier is marginal you can still use the filter without cutting down your modulation. Although different microphones vary slightly in their output capacitance, the manufacturer's tests show that the extremes of this range result in only about 100 cycles difference in the low-frequency cut-off point. The manufacturer's response curve of the filter indicates the response to be down 3 db. at 450 and 3300 cycles, and 20 db. down at 210 and 7300 cycles.

But a coldly scientific response curve doesn't give the whole story, and we thought that many readers would be interested in what the filter does to speech. The best test we could think of along these lines was to use the filter in the microphone lead feeding a "medium hi-fi" unit, switching the filter in and out as a number of office guinea pigs took turns speaking into the microphone. This was considered to be a better test than modulating a transmitter and listening on a receiver, since it eliminated the bandpass effects of the receiver and the possible distortion in both transmitter and receiver. The results were rather interesting, we thought. In most cases, observers reported no significant change in the voice characteristics. However, on two voices

(one male, one female) it did change the voice characteristic noticeably — observers agreed that these were "high-pitched" voices. The consensus was that the filter has good "balance" for most voices, but there will be a few where the use of the filter will change the voice characteristic. Since this is bound to occur with any fixed filter design, it would appear that the manufacturer has made a very good choice.

The Model 587 Audio Bandpass Filter is manufactured by the R. L. Drake Company.

## A.R.R.L. QSL BUREAU

The function of the ARRL QSL Bureau system is to facilitate delivery to amateurs in the United States, its possessions, and Canada of those QSL cards which arrive from amateur stations in other parts of the world. Its operation is made possible by volunteer managers in each W, K and VE call area. All *you* have to do is send your QSL manager (see list below) a stamped self-addressed envelope about 4¼ by 9½ inches in size, with your name and address in the usual place on the front of the envelope and your call printed in capital letters in the upper left-hand corner.

- W1, K1 — J. R. Baker, jr., W1JOJ, Box 232, Ipswich, Mass.  
W2, K2 — H. W. Yahnel, W2SN, Lake Ave., Helmetta, N. J.  
W3, K3 — Jesse Bieberman, W3KT, Box 34, Philadelphia 5, Penna.  
W4, K4 — Thomas M. Moss, W4HYW, Box 644, Municipal Airport Branch, Atlanta, Ga.  
W5, K5 — Oren B. Gambill, W5WI, 2514 N. Garrison, Tulsa 6, Okla.  
W6, K6 — Horace R. Greer, W6TI, 414 Fairmount St., Oakland, Calif.  
W7, K7 — Mary Ann Tatro, W7FWR, 513 N. Central, Olympia, Wash.  
W8, K8 — Walter E. Musgrave, W8NGW, 1294 E. 188th St., Cleveland 10, Ohio.  
W9, K9 — John F. Schneider, W9CFT, 311 W. Ross Ave., Wausau, Wisc.  
W0, K0 — Alva A. Smith, W0DMA, 238 East Main St., Caledonia, Minn.  
VE1 — L. J. Fader, VE1FQ, 125 Henry St., Halifax, N. S.  
VE2 — Harry J. Mabson, VE2APH, 122 Regent Ave., Beaconsfield West, Que.  
VE3 — W. Bert Knowles, VE3QB, Lanark, Ont.  
VE4 — Len Cuff, VE4LC, 286 Rutland St., St. James, Man.  
VE5 — Fred Ward, VE5OP, 899 Connaught Ave., Moose Jaw, Sask.  
VE6 — W. R. Savage, VE6EO, 329 15th St., North Lethbridge, Alta.  
VE7 — H. R. Hough, VE7HR, 2316 Trent St., Victoria, B. C.  
VE8 — W. L. Geary, VE8AW, Box 534, Whitehorse, Y. T.  
VO — Ernest Ash, VO1A, P. O. Box 8, St. John's, Newfoundland.  
KP4 — E. W. Mayer, KP4KD, Box 1061, San Juan, P. R.

## Strays

W9HCN's address has been changed three times in the last three months, but he hasn't moved. Seems he was caught in the middle of a post office redistricting.

CONDUCTED BY EDWARD P. TILTON, W1HDQ

**W**E'VE tried v.h.f. here, but it just doesn't work!"

Over the past twenty years or so we've heard this lament from just about every section of the country, including areas that eventually proved to be prize v.h.f. locations. How is it that so many hams, some of them in spots that could hardly have been more favorable, have come to the conclusion that they could not do interesting work on the frequencies above 50 Mc.?

Some have made their initial efforts with ineffective gear, certainly. You wouldn't expect to set any of our lower frequencies on fire with 10 watts, a broadband receiver and a small antenna. Why "try v.h.f." with such a set-up? Sure, low power and simple gear work well enough if you have plenty of near-by activity, but if you're going for extended ranges you'll need the best gear obtainable. A good big antenna, a low-noise receiver and good stability and selectivity are musts. High power pays off handsomely, too.

But alert operating is even more important. Most of the trouble, we think, has been lack of knowledge of what to expect, and when to expect it, and too few stations within the possible working range. Coordination of operating schedules can be mighty important. The best location in the world will produce a complete blank, if there is nobody on the air in the territory you're scanning with your beam. Countless opportunities for v.h.f. DX are missed in this way.

Take the Gulf States, for example. There is plenty of evidence that from Florida around to Texas, and up the Atlantic Seaboard to the north, too, tropospheric propagation on the frequencies above 50 Mc. is good more often than almost anywhere else in the United States, yet tropospheric DX on the amateur v.h.f. bands is still a rarity over these routes.

Early in May your conductor visited radio clubs in several Florida cities, and met with similar groups in Georgia and North and South Carolina. All along the line we found evidence of increasing v.h.f. interest. Getting going on 144 Mc., particularly, was a major objective. Before we arrived back in West Hartford 2-meter DX had already been heard or worked over several

southern paths that had never been spanned before, and new southern states should be showing in the "worked" totals of W1s, 2s, and 3s, as they already have appeared in the records of Texas, Louisiana and Mississippi W5s.

Here are some reports that indicate the possibilities. W4UUF, Pensacola, Fla., who got on 144 Mc. through the efforts of W5RCI last summer, has been working Texas stations frequently since the middle of March. W5FEK, Houston, says that W4UUF has hit S9-plus levels on several occasions, and has been heard working stations at 500 to 600 miles as fast as he could turn from one to another. We'll bet that Tampa to Houston, 800 miles, could have been worked almost as readily.

From Orlando, W4CSS writes that he and W4MSX and W4QN have heard W4UUF. This is an all-Florida circuit of some 400 miles that almost certainly could have included Jacksonville, Miami and other Florida cities, too. Just after midnight, May 8th, W4QN heard W4SMA, Whiteville, N. C., for more than an hour, but could not raise him. This is a 450-mile over-water path that is probably close to ideal for v.h.f. work. We suspect that Norfolk, Baltimore, or even Philadelphia might be worked from Florida points now and then, too. To aid in establishing contact with distant points, Orlando stations aim their antennas on the following

Don Goshay, president of the 2 Meter and Down Club of Los Angeles, shows some of the 1215-Mc. gear exhibited at a recent meeting of the club during which this band was featured. Numbered items are described in the text.

schedule, transmitting and listening for DX: 2045 EST — Miami area; 2100 — local check, beamed on Gainesville or Tampa; 2115 — Pensacola; 2130 — Tampa; 2145 — various directions, depending on conditions observed during above checks.

Activity on 144 Mc. in North Carolina has been coming along well in recent months. Our meeting in Raleigh was attended by an enthusiastic band of 2-meter men who are working the band for all it's worth, several of them in locations that should be hot spots for 2-meter DX. W4MDA, Wilmington, N. C., has since written that on the night of May 10th, while W4MDA was at work, K4CTW picked up a weak signal

with his beam north. Peaking the beam position indicated that the signal was from the south, and further listening showed it to be W4GGO in Miami! He was in contact with several locals, and the following were identified: W4UIW, Hialeah; W4UTJ, location unknown; and W4JZB, Hollywood. The path from Wilmington to Florida East Coast cities is entirely over water. Though it's some 600 miles to Miami, we think the hop might be made quite often on 144 Mc.

W4CVQ, Raleigh, and W4MDA and W4SMA demonstrated their ability to work north on the night of May 3rd, and into the following morning, contacting innumerable W1s, 2s and 3s on 144 Mc. The best DX we've heard of as the result of this night's work is W4MDA to W1JSM, Waltham, Mass., close to 700 miles. As signals were good over this path it is obvious that longer distances await only the appearance of stations on 144 Mc. in South Carolina and Georgia.

From now on through the summer and fall months there will be many opportunities for work over distances of 1000 miles or more on 144 Mc. and possibly higher bands. The 50-Mc. band will be open for hops up to at least 2500 miles during the early summer. The Atlantic Seaboard and the Gulf Coast are only two of the many paths where such work will be possible. The Pacific Coast, from San Diego to Seattle, should be included in the potential DX paths for 144 Mc. We know that the vast Middle West can be crossed in any direction by 2-meter signals, and even the highest mountains and roughest terrain can be covered under certain conditions. Whether or not we work DX on the v.h.f. bands this summer depends far less on the character of our locations than on whether there is activity in the right places, at the right times, with the right kind of equipment. If we take maximum advantage of the breaks that Nature will provide, there should be many new states worked on 50 and 144 Mc. and new DX records on 220 and 420 Mc. to report before the end of 1955.

### Here and There on the V.H.F. Bands

The best 432-Mc. DX so far reported in 1955 was worked April 30th by W3BSV, Salisbury, Md., and W1OOP, Needham, Mass. This 365-mile contact, at 2205 EST, was made with good signals both ways, indicating that if the 432-Mc. enthusiasts around Norfolk, Va., had been on hand a new record might have been set.

The night of May 3rd was a big one for VE1QZ, Dartmouth, N. S. Beginning about 2120 EST, Oscar heard 144-Mc. DX signals, and between then and 0032 EST he worked W1DEO, Cape Elizabeth, Maine, W1KHL, S. Norwalk, Conn., W1KYF, Ridgefield, Conn., W2TBD, Medford, N. J., K2IEJ, Oceanaside, L. I., and W1REZ, Stratford, Conn. W2TBD is about 650 miles. VE1QY, Yarmouth, N. S., also had a busy time that night, but we have no record of his contacts.

The 2-meter DX schedules of W7VMP (May QST, page 59) have yielded no positive results up to press time, but a separate sack with W6WSQ is producing regularly. It is 350 miles and many mountains from Phoenix to Pasadena, but signals are being heard regularly, though weakly, each way.

We get some of our v.h.f. news the long way. This tidbit came from TI2BX. He says that CO2NZ will be trying for U. S. contacts on 146 Mc. after about the middle of June. Transmissions of 3 minutes' duration will be made at 1230 and 1300, 1800 and 1900, and 2030 and 2100 EST, with listening periods following each transmission.

The advent of Technicians on 50 Mc. has helped the activity picture markedly. Not only has the new order produced additional stations, but it has encouraged the old hands to spend more time on the band. Here are a few regularly scheduled operations we've heard of recently. In the Puget Sound area W7s TMU YJE DYD TMM PQS UFE PRW KGQ VIC PZP KO and GOU are on 50.4 regularly, checking the band at 1900 PST nightly. W5ZVF is on 51.16 Mc., evenings and early mornings. W0FKY and W0CNM are active regularly in Grand Junction, Colo., also making trips into Utah in the hope of providing that very rare state for some of the gang. W0FKM is on 50.064. Hal reports that there is an active 2-meter net in Western Colorado, comprising W0CNNI, 144.1 Mc., W0PXZ, 147.2, W0QEL, 144.4, W0PCB, 144.5, and W0FKY, 144.018.

From the R.F. Carrier, Dayton Amateur Radio Association sheet, we learn that 2100 is 6-meter time in the Dayton area. W8WRN, Columbus, checks 6 (makes transmissions; no cold-filament listening) several times daily. W8CMS, Newton Falls, Ohio, says that about 20 new stations have appeared locally, with prospects good for at least 10 more soon. Claire now has a 4-125A in the final on 6. W8PCK, Silvertown, Ohio, is on each morning, Monday through Friday, between 0900 and 1115, and at all hours over week ends. He says that W8s HQK SVU QIS PLB JSW LPD PCK and SDJ are keeping the band active in the Cincinnati area. An unsigned note reports that the Joliet, Ill., Amateur Radio Society has a net on 53.28 Mc. W9OKM and W9VQO monitor this frequency regularly with fixed-tuned receivers.

That Nevada-Utah expedition we reported in May QST is being whipped into final form by W2QCY. The 6146 transmitter delivers 45 watts output, and the converter is all set, as is the audio section. Some test hops to near-by high locations will be made in June, to be sure that all is in order for the big one the latter part of the month. Provision will be made for VFO operation, both 'phone and c.w. Operation will be undertaken from Utah and Nevada locations during the latter part of June and early July.

That hard-to-work state of Nebraska will be on tap again this summer, courtesy of W9EET/Ø, at Lincoln. Gordon will be set up about July 5th, and will operate through at least the 16th. His rig will run 90 watts input on 50.1 to 50.4 Mc. He will QSL all contacts, but eager ones may write him at his Callbook address in Chicago.

The 50-Mc. DX season got under way in good style over most of the country during May, and DX reports were coming in to your conductor's desk in numbers we've not seen in some years. Sporadic-E skip of the single-hop variety is a common occurrence in May, June and July, despite the fact that it always comes as a big surprise to the newcomer to learn that contacts can be made on 50 Mc. over distances of 1200 miles or more. Individual reporting of two-way work is out of the question at this season, because of the great number of contacts made. We're always glad to have the reports, however, as they help to keep the national picture in focus, so keep 'em coming.

If you have trouble reading the modulation on weak signals, try turning on the b.f.o. and tuning it to zero beat, says W9GAB, Beloit, Wisc. On some receivers this will make an appreciable improvement in the readability of voice modulation.

The 2-meter net of the Atlanta area, inactive for some time, is being reactivated. W4LRR reports that a meeting is held each Sunday at 1300, on 144.138 Mc. The gang usually get together Saturdays around 1000.

W5FEK, Houston, reports some nice work on 144 Mc. W5UUM at Edna, W5IHS, Eagle Lake, and W5IRP, Livingston, work regularly at noon. Livingston is about 120 miles, and Edna is 160 miles. W5IRP has also worked W5EIV, Alice, Texas, about 290 miles on noontime skeds. These are not long distances for band-open conditions, but the skeds are maintained at a time of day when propagation is not likely to be too favorable.

V.h.f. DX tip from a guy who never works any, W9BRD. Rod sits for hours at the console of KSB242 listening to the signals rolling in on the 155-Mc. police band. He says that there are hundreds of stations on 155.37 Mc., and 155.01, 155.13, 155.25, 155.61 and 155.73 are other widely-used channels. Other frequencies in the same part of the spectrum are used locally. As the point-to-point stations give their locations in each transmission, the signals are reliable indicators of good v.h.f. conditions. Now you may not be set up for listening in this frequency range, but plenty of ham

**Calls in bold face are holders of special 50-Mc WAS certificates listed in order of award numbers. Others are based on unverified reports.**

operators of police equipment are. They're good fellows to know, if you want to keep tabs on favorable propagation.

Confusion in the Picnic Department. Unknown to each other, the Terre Haute and Western Michigan v.h.f. groups scheduled picnics on the same date, July 31st. When the Michigan gang heard that they decided to move their date to August 14th, Turkey Run having become something of a National Convention of v.h.f. operators in recent years. This info from W8NOH.

Here's a 220-Mc. item we missed last month. On April 22nd W5AJG hit the jackpot. After catching a new state on 144 Mc. by working W4UUM, Pensacola, Fla., he hooked up with W5JTI, Jackson, Miss. Signals were strong on 144, so they changed to 220 and worked on the higher band with equal signal strength. This is just under 400 miles, and W5AJG's first out-of-Texas contact on 220.

### 1215 Night in Los Angeles

The Two Meter and Down Club of Los Angeles has been an eminently successful v.h.f. club for some years now, but the "and Down" part of the organization's name has not received too much attention. There has been scattered activity on 220 and 420 Mc., but little on the higher bands. To encourage members to move to higher frequencies, the club recently staged a 1215-Mc. night, under the direction of its president, Don Goshay, W6MMU.

Members were urged to bring equipment for 1215 Mc. and higher bands to the meeting for others to see. Some of the gear is shown by W6MMU in the accompanying photograph by K6GLG. Item 1 is Don's parabolic reflector. The illuminator has a standing-wave ratio of 1.09:1 at 1225 Mc. Just below it is a collinear array with plane reflector made by W6NLZ. Phasing lines are electrically one wavelength long, so no transposition is needed. Pairs are spaced ¾ wavelength apart physically. Item 3 is a mixer assembly by W6DQJ. It has a quarter-wave coaxial line tuned at the

**More FCC Suspensions.** Several different and significant FCC actions have already been reported to you; see page 70 of March '55 *QST*. To those now add the following:

FCC Ordered (29 April, 1955) that the Novice Class operator license of A. R. Bookoff, Miami, Florida, be suspended 120 days, that the license be turned in to the FCC and KN4BQU not be permitted to be operated by any person in the 120-day period, *it appearing that the licensee*, on Jan. 14, 1955, violated Sec. 12.23(e) and 12.158 of FCC rules by using call sign KN4BQU which is not assigned to him and by transmitting on a frequency of 3855 kc. using Type A-3 emission which is not authorized for use by Novice Class licensees.

FCC Ordered (11 May, 1955) that the Technician Class amateur operator license of Charles K. Heath, Hinsdale, Illinois, be suspended for six months, that the license be turned in to the FCC and W9ZIZ not be permitted to be operated by any person in the period of the suspension, *it appearing that the licensee* while operating or supervising work at his amateur station violated Sections 12.23 and 12.28 of FCC rules by transmitting and/or authorizing others to use his equipment on frequencies below 50 Mc. He violated sections 12.82(a) and 12.158 of the rules with regularity by using and/or offering others while using his equipment to use call signs not assigned to him, especially W9WFN/9; and also violated section 12.136(b) by not keeping his station log with proper signatures.

**About Learning the Code.** Having memorized the code by its sound values many (starting in) look to some radio club or operator who is a friend for 'round-the-table instruction. This is fine, when it can be got; besides a League booklet *Learning the Radiotelegraph Code* that can help, ARRL also periodically prints a list of clubs that have arranged to give local instruction to assist budding amateurs. But it is no occasion to despair if completely without such a local group. Many of the *best* operators learned their Continental *by listening*. It is important in getting started to listen to tape-sent code or an experienced operator to get the proper sense of rhythm, or the spacing of characters and words in code work. The most vital thing of all is to *practice*; stick with it for yet more practice. Only practice makes progress and perfection possible. In using W1AW's daily hour of practice do *not* stop "writing down" at the speeds you can comfortably set down on paper! Copy just as diligently *all the letters you can get* at higher speeds. Use the bulletin transmissions in the earlier or later period deliberately to get what you can at speeds definitely beyond your ability to make solid copy! Look over the bands and spectrum between the amateur bands for stations that are repeating their identification or calls.

You may not at first be able to make much of this. With careful listening to repeated calls, however, you will start getting a letter here and

there, till finally you have a whole transmission and the station's identity. It is bound to be a big thrill to ferret out this pioneer bit of intelligence, entirely by your own efforts! Don't overlook the opportunity to hook up an inexpensive oscillator and key and *send* in rhythm with the W1AW tape, too. (Consult the monthly *QST* announcement of the Code Proficiency Program to note those special nights when we give the subject of the practice text. With that in hand you can send in step with the transmitter and perfect your rhythmic responses.) A *lot* of receiving practice is essential. Highest authorities in this field of learning, however, recommend that at least 25 per cent or more of one's time be spent in *sending* practice. This advances the general ability to coördinate in fast recognition of all the letters and aids your *reception* as well as sending ability. The whole idea in amateur radio is "learn by doing." Once you can memorize and buzz the letters locally, most anyone can learn Continental just by regular periods of tuning in and getting the essential practice on the stations that can be tuned in.

**Why? (Echo from ARRL DX Test!)** P. W. Watson, ZL3GQ, writes, "May I say how much more satisfactory the number system as used by the Ws in your DX Test was. This must be of inestimable value to anyone chasing WAS. However, I have one minor criticism of W/VE operating. If a W/VE receives a report of 579 to 599 I'd estimate 95% of the time he could send the exchange *once*. Why did those getting such reports send their number three times? . . . And when a lower S report was given even send it four times!" We confess we can't explain this, since in our poor efforts with a paltry 200 watts, we never had to use more than a single repeat as an investment against a time-consuming additional transmission. It is our guess that some operators have never reflected that the "R5" means "perfectly readable" with the S7 to 9 indicating "moderately to extremely strong signals!"

**RACES Insignia.** Until recently we had not heard where RACES authorized groups could obtain the RACES insignia as mentioned in this column in April *QST* and as illustrated herewith. A number have written for more details so we quote from the FCDA memo which constitutes the legal background and the detailed description. "The RACES insignia has superimposed on the official Civil Defense insignia a white jagged arrow edged in blue resembling a flash of lightning, symbolic of space radiation, containing the inscription 'RADIO' in blue letters, and extending

from the upper right circumference of the blue circle through the lower lefthand angle of the triangle. Below the triangle and within the blue circle is the inscription RACES in white letters."

W9UMS writes us that their c.d. office at Evansville, Indiana is financing their group to obtain 50 RACES c.d. emblems. W2BGO advises that the Forbes Products Corporation, 625 So. Goodman Street, Rochester 20, New York can supply the design at 25 cents each in lots of 500.

— F.E.H.

Versatile W9NZZ is perhaps most famous for the traffic work which won him the 1953 Edison Award. Some of the other certificates and awards which Stan has earned pounding brass since 1922 include: Edison Award Special Citation, 1952; Edison Award Hurricane Citation, 1954; plaque from British Arctic Expedition, 1952-54; Indiana's Outstanding Radio Amateur, 1954; two ARRL Public Service Awards; A-1 Operator Club; CP-35; BPL Medallion; section winner, 1947 VE/W Contest; DXCC (150); KZ-25; WBE; BERTA; DUF-4; Radio Onda; RCC; WFJS; WASM; WAC; WAS (3 bands, c.w.); WAVE; OTC; ORS; 50 BPL cards; and several crests and trophies from the Arctic.

APRIL CD QSO PARTIES

"One of the best spring parties on record," were sentiments voiced by numerous participating ARRL appointees and officials. ORS W6BIP found activity brisk enough on 80 through 15 meters for him to grind out 146,497 points and leave other c.w. competitors in his wake, while New Mexico ORS W3DWT supplied a tougher section as he went about accumulating 144,270 score-points. W4YHD's shrewd handling of the M.I.T. set-up likewise resulted in a husky tally for W1MX. Sidelight: W4KFC took part for just a short spell but reports his busiest flurry in any contest to date: 73 QSOs in one hour of 3.5-Mc. brasspounding. . . . Despite fierce QRN from storms and rain static, PA1/OPS W4TVO plied 40 and 75 for a dandy 20,825-pointer to edge the 'phone brethren. W9KDV, with W9VFY doing the talking and switch-throwing, and RM W1CRW reached the other top positions with scores of 15,840 and 14,645 points, respectively. Full results in July CD Bulletin.

William F. Ham, W1RRX, ARRL Section Emergency Coordinator (fourth from left), congratulates James Saunders, W1BDV, Faculty Advisor of the Northbridge High School Radio Club, Whitinsville, Mass., as club members look on. W1RRX lauded the group for developing teen-age radio operation and expressed the wish that more schools would follow their outstanding example. The occasion was the appearance of the students on Teen Time, a weekly program honoring youngsters and telecast over W WOR-TV, Worcester.

NATIONAL CALLING AND EMERGENCY FREQUENCIES (kc.)

C.W.	'PHONE
3550 14,050	3875 14,225
7100 21,050	7250 21,040
28,100	29,640

During periods of communications emergency these channels will be monitored for emergency traffic. At other times, these frequencies can be used as general calling frequencies to expedite general traffic movement between amateur stations. Emergency traffic has precedence. After contact has been made the frequency should be vacated immediately to accommodate other callers.

The following are the National Calling and Emergency Frequencies for Canada: C.W. — 3535, 7050, 14,060; 'phone — 3765, 14,160, 28,250 kc.

----------	----------

There seems to continue to be some question about the relation between the AREC and RACES. Why, we wonder? On a good many occasions, we have attempted to clear this up, but in some places there is still conflict. Who causes the conflict is a detail, but it takes two to make a fight. Obstreperous AREC groups on the one hand, and a cold, fishy attitude on the part of c.d. people on the other hand can cause all kinds of trouble. They are matters for local resolution.

ARRL's official view of the relationship is that the two organizations are (i.e., *should be*) overlapping and inter-lacing — in some places identical. We are not ready to drop the AREC overboard, for several reasons. The most important one is that we've worked hard, we amateurs, for the last 20 years, to make the AREC our own emergency service organization, and we're proud of it. As long as there is a need and use for it, we want to maintain it — and where no particular c.d. program exists, there is plenty of need for it.

But this does not mean that the AREC wants nothing to do with RACES. On the contrary, long before there was an FCDA heading up the nation's civil defense preparedness effort, ARRL officials were urging that radio amateurs be given a key rôle in civil defense communications. As much, if not more, than any other group or individual, ARRL was

Amateurs of the Sioux Amateur Radio Assn. have converted this bus into a mobile communications center. Civil Defense and Red Cross have cooperated in installing transmitting and receiving equipment, a 6500-watt generator, field telephones and a p.a. system.

an active midwife at the birth of RACES. We think, and have thought right along, that the AREC is the natural and logical instrument at local level for the implementation of RACES. In the places where RACES has been most successful, it has been just this. It's one of the things that the AREC was set up for: to serve any need for emergency communications that might arise.

Such a philosophy will not embrace the premise that precipitant abandonment of all previous organization for a new concept is a desirable course of action to follow. You might as well ask the telephone and telegraph companies to abandon their previous organization and set up anew, under new leadership, new policies, using new equipment. It won't work. *Full use of existing facilities* is requisite, both to our efficiency and our economy. The AREC is an existing facility. It is flexible enough to embrace the new civil defense function, and where sufficiently supported can (and has) become RACES. The EC and radio officer, if they are different people, *must* work together toward the common civil defense end, whether they care for each other personally or not. AREC members *must* sign up in civil defense. We have a job to do in implementing RACES. Civil defense has a job to do in utilization of the amateur

service for communications purposes. Let's stop asking ourselves and each other foolish questions, and *get the job done!*

The AREC and RACES, at top level, are wedded for the duration. This state of wedlock must be made to extend to all levels. That's the job of you fellows on the ground floor, so get a firm grip on your prejudices, personal and otherwise, and let's get the ceremony under way.

— . . . . —  
A snowplow and its crew got stranded in a blizzard in the wilds of Western Nebraska on February 19th, and W0AIN was called on to help find them. He contacted W0LOD in Ogallala on 3525 kc., since telephone lines were down between Ogallala and Lewellen, and relayed the information that they had left Lewellen at 1700 on the 19th. Late the next afternoon it developed that the men were safe. W0AIN sent this word to W0LOD, who notified their families. Other stations participating: W0s ZAA GEQ UOB BEN.

— . . . . —  
When a telephone cable broke down between the La Crosse (Wis.) Municipal Airport and Madison on February 25th, amateurs filled the communications gap until it was repaired, obtaining weather and flight information from Madison on behalf of airport officials, CAA and the Weather Bureau. W9GPO and W9OGT held down the La Crosse end, while W9OOL kept contact from Madison. Excellent publicity was received on television, radio and the newspaper on this bit of public service. — W9AKY, EC La Crosse, Wis.

— . . . . —  
From the Ontario SCM we have gleaned the following: "We would like to commend VE3UJ who tried for two hours to get Sarnia and Chatham Civilian Defense hooked up during the windstorm of March 22nd. The Oil City Civil Defense readied two trucks to dispatch to Chatham, but the efforts of VE3UJ made the long and dangerous trip in grim weather unnecessary. Appreciation from c.d. officials is extended also to VE3s AWQ LB DIJ DZ and MW. Traffic for the London *Free Press*, civil defense and police officials was handled due to wire facilities being out. VE3EI and VE3BVM also exchanged important traffic.

— . . . . —  
A severe train accident near Albany, N. Y., was the occasion for some creditable work turned in by amateurs of the Capital Area Radio Emergency Net on April 2nd. W2EOM and K2ACB flashed word of the emergency and within a few minutes six mobiles were proceeding to the scene. K2CWX assumed net control. Of the six mobiles, W2EOM, W2SZ, K2AYH and KN2IUE arrived at the scene. KN2JHY was turned back by police, and W2FEN set up in Castleton to act as a relay station. K2AYH, W2SE and KN2IUE placed their cars at strategic locations while W2EOM took his portable down to the wreck. Stations on the "home front" were W2s AWF DIF TMM and K2s BUV (operated by W2GTZ) ACB and GAZ. The net was conducted in an efficient and businesslike manner throughout. Much informal traffic was handled and one formal message was relayed out of the area via K2BUV. Much credit for the operation goes to the NCS, K2CWX, at the Veterans Hospital.

— . . . . —  
The Smoky Mountain Amateur Radio Club in April organized a network to furnish radio assistance to the Maryville (Tenn.) Police Department when this community was left without adequate emergency telephone service. W4BXG (EC for Blount County) reports the following stations active: W4s AMA BXQ FEP JSP OKD NLJ TZB VSS VTT ZEN ZSI QZC FHT, KN4s AAO AAV COF CRV, and W5ILR/4. These stations manned net facilities consisting of fixed and mobile units on two and 160 meters. For 23 days, police traffic, medical and other matters were handled as emergency radio communications.

— . . . . —  
VE5LU, SEC Saskatchewan, reports that landlines were out in the blizzard that hit southwestern Saskatchewan April 3rd. Amateurs assisted in restoring communications for the power companies, VE5TV and VE5LU maintaining schedules three times daily through April 6th. Others participating: VE4AI, VE5s BO TV CM BH RU CX MS LU and RE.

— . . . . —  
The Texoma Amateur Radio Club was called into action for emergency operation when a tornado struck Sherman, Texas, on April 6th at 0245, disabling telephone and power

circuits. The first mobile was on the air at 0415, a net control station with auxiliary power having previously been set up. The civil defense radio unit operated three field stations and four mobile stations several hours following the storm with one out of town trip to Perrin AFB for additional fire-fighting apparatus for Gunter. The work of the amateurs participating was highly commended by the civil defense director and assisting auxiliary police chief. Those participating were W6s UTB IDZ POG LDG SGR DGG and UIQ. — W5UTB, EC Sherman, Tex.

The snowstorm that hit western Nebraska on April 12th took the town of Potter out like a light — literally. Potter had no electric power for two nights, and communication lines were down, too. W0KQX started his putt-putt in his snow-covered back yard and made contact with W0UOB, in Sidney, to provide the only communications. He was able to tell Sidney that no special emergency measures were required, although many Potter residents were suffering from cold. The communications situation was returned to normal on April 13th.

On April 17th, a distress call from W6GRU/m was heard on the American Legion Amateur Radio Net frequency (3975 kc.). He gave his location as the Donner Pass road east of Sacramento, where the snow had reached 18 inches, resulting in blocked highways. Traffic was heavy due to the North American Ski Championships being held in the area. W6GRO took over the net, with W6EPB assisting, and contacted the California Highway Patrol to start relief equipment on the way. The experience gained in the Tehachapi earthquake proved invaluable. An amateur employed by the California Highway Patrol (call unknown) set up a station in the office and maintained contact with W6GRU/m until relief arrived about 2240. K6EJT and K6ECP maintained control with W6GRU/m until he reached Sacramento. Also active were W6s QMO CNA OFJ and IDY. This incident rated bare headlines in the Los Angeles Times for April 18th.

— W6WJP, PAM San Joaquin Valley

The Alabama Emergency Net P was alerted at 2200 on April 23rd during a tornado warning for Northern Alabama. The alert lasted until 0230 April 24th. W4s HKK TKL AZX and ZSQ took turns as NCS. Traffic was handled for the Tennessee Valley Authority to participate in the search for a lost boat on the Tennessee River. Other stations participating: W4s ZWE ATF FEC CDE SX OAO IKE NIQ WXW YDU ZSH ZSB UHA HYI BOE MEP HTP GCV WEM OGV SMD WGT GVI HFU, W5s RNB GGG SHX.

— W4TKL, SEC Alabama

On May 3rd, a heavy snowstorm hit Saskatoon, Sask. The wet snow clung to everything it hit, and soon telephone and electric wires and poles were bending and snapping under the weight. At 1730, VE5LMI called VE5BG to relay a message to the phone company that his telephone was out. W5RE also was without telephone communications. VE5DR was asked by the civil defense director to arrange communications for the power company. This he did, and VE5DR and VE5EH went to the local club station set-up at c.d. headquarters. There they found the antenna down. After repairing this, the power went off; so they took a portable power plant to the VE5DR location and were soon on the air.

This was the beginning of a busy time for the amateurs. VE5s DN, DG and RE were kept busy handling messages for the power company, which was in dire straits, and later the railroads called on the amateurs to help them with some of their communications. Schedules were maintained from VE5DR (with VE5EH assisting) all through Tuesday night. VE5JG at Regina also came on the air, staying until 0200. VE5s DN and RE remained operative throughout the night. On Wednesday morning (May 4th), VE5CM was on from Regina and remained all day. VE5WW also was on from VE5DG, and VE5JP did some very valuable relay work. VE5BU operated on emergency power for a while, but ran out of gas. VE5BG took over from VE5DR at 0830 Wednesday, later assisted by VE5s BD RL and DU. VE5VL was on stand-by. VE5s FY and YF sent and received news dispatches to the outside by tape recorder, since normal news-dispatching agencies were without communications. Helping out in this news coverage were VE5s JP YJ RB VD DD and WW. Considerable traffic

was handled during the day by VE5DR, who later made a radio broadcast via amateur radio, VE5DR to VE6OD. VE5HR was in the hospital and unable to be active, but supplied us with all the above data.

— . . . .

Sixteen SEC reports were received for March activities, representing 5356 AREC members: Minn., S. Dak., Ky., Tenn., Maritime, Ga., Wash., W. N.Y., E. Fla., N.Y.C.-L.I., Ore., Wisc., San Joaquin Valley, E. Bay, Los A., Ont. The Los Angeles SEC reports 1424 AREC members in his section, and claims this to be the highest in the United States, by plenty. The number increases a little each month. So far, no one even comes close to this number, N.Y.C.-L.I. being second with 742.

## RACES News

From FCDA, we have the latest info (May 17th) on states having fully-approved RACES plans. We thought this would be of interest to you. The following are fully approved for RACES: Alabama, California, Colorado, Connecticut, Delaware, Georgia, Illinois, Kansas, Louisiana, Maryland, Massachusetts, Michigan, Missouri, Nebraska, Nevada, New Jersey, New Mexico, New York, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, Tennessee, Vermont, Virginia, Washington, West Virginia, Wisconsin, Alaska, Hawaii, D.C. Now being processed are the state RACES plans for Florida, Minnesota, North Carolina and Wyoming. Not yet heard from are Arizona, Arkansas, Idaho, Indiana, Iowa, Kentucky, Maine, Mississippi, Montana, New Hampshire, North Dakota, South Carolina, South Dakota, Texas and Utah. Thus, 29 states, two territories and D.C. now have approved RACES plans, and by the time you read this the chances are good that four more will have been approved. RACES organizers in the states mentioned above as "not yet heard from" should get the ball rolling toward their state RACES plan, if possible. The time to do this is now, not after the bomb falls.

One place where they have successfully combined the AREC and RACES is Steubenville, Ohio, where, under EC/RO WSERR, this group had the second FCC-approved RACES plan in the state. The main control is located in town, but there is also an alternate control station seven miles out of town. A 22-foot house trailer is being equipped as a mobile alternate control station. The call used for RACES is WSERR.

— . . . .

In St. Lambert, Que., amateurs are alerted for civil defense by the police station, which receives the warning from the Air Defense Command, RCAF. Only EC VE2KG is called. He then calls two other amateurs, each of whom call two additional amateurs until all personnel are alerted. This process makes it possible to notify all personnel within six minutes after receipt of the alert.

— . . . .

We don't believe we have previously recorded the presence on the FCDA staff of another amateur. He is Jim MacGregor, W8DUA, formerly in charge of Kalamazoo Police Radio and a staff member of WOOD-TV in Grand Rapids. Mac visited us in connection with the April 30th Region I Test, and will work with Charlie Dewey, WSLBM (see April QST, p. 73), on RACES. It is good to know that we will have two active amateurs on the FCDA Staff so intimately concerned with the processing of RACES applications and RACES implementation on a national scale. We hope that their presence will have a salutary effect on the progress of RACES at all levels.

— . . . .

From Key-Kliz, publication of the Santa Barbara Amateur Radio Club, we glean the information that the Santa Barbara RACES plan has been approved by FCDA as of March 21st, the first approved plan in California C.D. Region Seven. This was the result of "three years' intensive spadework by c.d. officials in this area," says the bulletin. Frequencies to be used are 29,550, 29,470, 145,460, 145,500 and 147,240, crystals for which will be furnished authorized amateurs. K6BVA is the call that will be used by all stations. Says the editor: "Key-Kliz will keep you posted as the red tape is unraveled."

## MEET THE SCMS

Edward F. Conyngham's interest in radio dates back to his early childhood when he heard all the wonderful accounts of how the operator on the SS *Titanic* sent out messages reporting the disaster. A few years later an ex-Navy operator gave him first-hand information on the workings of radio and in 1934 he was issued his first license.

W7ESJ is housed in a special room and transmitting equipment is comprised of a Navy TBW-3, 803 final; a Navy GP-7 modified, 803 final; a Navy TCS-12, pair of 1625s final; a Viking II; an Elmac AF-67; a Lyco 600; and a homemade rig with a pair of 46s in the final. Re-

ceivers are an S-76, a BC-342, an Elmac PMR-6A, and three Command receivers for monitoring. Antennas regularly used are an 80-meter half-wave, center fed with open-wire line; a 100-ft. Marconi; and a 50-ft. Marconi. For emergencies a PE-108 a.c. generator is used to power the Elmac and TCS transmitters.

Since his election as Oregon's SCM, Connie has relinquished his appointments as Official Observer and Section Emergency Coordinator, but has retained the post of Official Relay Station. He has been issued Public Service certificates for his assistance in Columbia River and other emergencies and also has Rag Chewers Club, Old Timers Club, and Code Proficiency certificates, the latter for 35 w.p.m. While on a destroyer in 1939 he was clocked for 1½ hours receiving press at 52 w.p.m. He holds membership in the Portland Amateur Radio Club and the Amateur Radio Association of Bremerton and is an enthusiastic participant in the monthly on-the-air parties for League Officials.

A retired Navy man, Connie enjoys skiing, sailing, rowing, and watching baseball. His other hobbies are cartooning and drawing (the picture shown here is self-drawn).

## TRAFFIC TOPICS

We traffic men have a tough row to hoe during the summer months. The QRN gets worse, the days get longer, other activities get in the way of nets and schedules, and on a national basis "daylight saving" time makes a mess of our NTS time schedule. Nets lose personnel while operators go on vacations. It's a tough time of the year for organized traffic handling, and many have asked us why we try to keep going in that, why we don't close up shop in May until October.

That's a fair question, and it deserves a fair answer. After all, isn't it true that most, if not all, of us traffic men handle traffic because we like it? Never mind *why* we like it — we just do. Do we, then, enjoy it during the summer months, with lightning playing around our antennas, with weak signals and the crash of static in our ears? Are we *really* nuts?

Let's ignore that last question as an interesting but somewhat irrelevant matter of conjecture, and get at the one before it. We think that the traffic man who persists in his efforts to handle traffic when the going is rough does so because he finds challenge in it, and meeting this challenge is a form of enjoyment. Handling traffic under unfavorable operating conditions, whether they be atmospheric, propagational or environmental, is something we would certainly have to do in a national emergency. Those who meet the challenge of doing so, for whatever reason, are the ones who will be the mainstays in any national emergency, while those who throw up their hands and quit during the tough season will find themselves severely handicapped by lack of experience when the chips are down. So we offer this salute to those of the traffic gang who are still in there pitching, making our amateur traffic service a year-around service

instead of a "fair weather" plaything. Our hats are off to you, fellows!

Miscellaneous reports: (1) W8AMH reports a traffic total of 837 for the Early Bird Transcontinental Net for April, eleven stations participating. (2) The New York State Phone Emergency and Traffic Net handled 255 messages in April, with 1114 stations participating, according to W2GSS. (3) W1LYL reports 678 messages for the First Call Area Section of the Transcontinental Phone Net, with 15 stations participating. (4) The College Net had eight meetings, handled 18 messages; 62 stations called in.

**National Traffic System.** Recently someone asked us about the general quality of our NTS leadership personnel. We replied that they were all good, and some were better than others. That's exactly the way we feel about it, too. There isn't a poor manager in the whole of NTS, and never was. Managing an NTS section, regional or area net is no kid's game; neither does the job get harder or more important as you go up in level — if anything, managing a bunch of finished traffic men (such as those at regional or area level) is easier than doing the same at section level, where training has a more important role.

You fellows who participate in NTS owe it to your net manager to do your best to help him out. Volunteer for assignments needed, criticize freely but constructively, and be on deck as often as you can when the net meets. It's your net as well as his. Your participation is not particularly benefiting him, or ARRL, or even yourself; it's benefiting all of amateur radio as well. Keep this in mind, and remember also that the net manager needs your help, advice and interest. Don't leave everything to him, then blame him when the net stagnates. It's up to you, too.

### April Reports:

Net	Sessions	Traffic	Rate	Average	Representation
1RN	26	4400	0.60	15.4	92.9%
2RN	52	542	0.26	10.2	93.6%
3RN	48	309	0.43	6.4	86.8%

TCC (Eastern)		153			
(Pacific)		457			

Summary	641	7391	RN5	11.5	PAN
Record	673	8990		17.8	

\* Section nets: AENB & AENP (Ala.); TLCN (Iowa); NTX (No. Texas); CN & MCN (Conn.); WYN (W. Va.); KYN (Ky.); MSN & MSN Fone (Minn.); GSN (Ga.); WSN (Wash.); QKS, QKS-SS & QKN (Kans.)

### Late reports:

RN7 (Mar.)	44	222	5.0	48%
------------	----	-----	-----	-----

W4BVE has accepted the 4RN managership, so we can begin to look for increased activity from that quarter. RN5, under the managership of W4OGG, exceeded their previous record of April traffic (442) by so much that it

Dave Goggio, W4OGG, energetic manager of the Fifth Regional Net (RN5) of NTS, relaxes at his operating position. Dave has rejuvenated RN5 from low ebb into one of the hottest regional nets in NTS.

"ain't funny." Dave is doing a super job of getting the RN5 sections organized, and getting a lot of support from everywhere but Southern Texas. W6ZRJ is the new manager of RN6, replacing W6JOH; let's give Doc plenty of support. VE7ASR is making a big effort to get 100% representation of sections in RN7, but it's not easy. W9UNJ is resigning as 9RN Manager as soon as a replacement can be found. TRN has adopted a thrice-weekly schedule for the summer, but will endeavor to continue 100% liaison with EAN. PAN is going great guns, but Manager W7APF is having TVI troubles.

*Transcontinental Corps.* No report from Central Area this month. W8UPB reports for Eastern Area that most schedules are holding together, but there are some significant vacancies. Pacific Area is doing excellently, but now that W6HC is an ARRL Director he feels that he cannot continue as TCC Director, so there will be a new TCC Pacific Area Director soon.

## AMATEURS SCORE IN TELETHONS

We have eight reports of amateurs participating in telethons connected with the March of Dimes early in 1955. Let's summarize each one briefly, in chronological order except that dateless reports come last.

1) The Panhandle Amateur Radio Club of Amarillo assisted in the March of Dimes Telethon in that area, which started in mid-January. Eighteen amateurs in the area participated, handling 1792 messages and collecting contributions or pledges for more than \$7600.

2) Seventeen members of the Cascade Net of Portland, Ore., were among the participants in the special March of Dimes drive January 21st-22nd. A transmitter at the KOIN-TV studios was set up and operated during a special 4½-hour program. As viewers telephoned their pledges, W7AEF at the studio set-up called the nearest of 19 mobiles spotted throughout the city, which then proceeded to make the collections. During the period, the mobiles picked up a total of \$2215.82.

3) In Broward County, Fla., fixed stations in amateurs' residences were used to radio dispatch mobiles as the calls poured in over broadcast and TV stations. Thirty home stations and 15 mobiles were active in this operation on January 29th-30th.

4) In Nashville, Tenn., Operation Poliothon was a combination AREC workout and a public service venture of Nashville and Davidson County amateurs. Free time was furnished by WLAC-TV for the full period of the Telethon from 2200 January 29th to 1300 January 30th. As telephone pledges were received, a mobile would go out with a member of the Junior Chamber of Commerce, sponsors of the Telethon. Nineteen ten-meter mobiles were used during the operation, with six fixed stations scattered around the city as relay stations whenever the need arose.

5) The Owensboro (Ky.) Amateur Radio Club supplied transportation and communication for the "Mothers' March Against Polio" in that area, covering Henderson and Evansville in addition to Owensboro. A base station was set up at Mothers' March headquarters, and mobiles dispatched to make collection whenever a telephone pledge was received. Amateurs also conducted communications from the various schools at which the Mothers' March had its headquarters.

6) On February 18th, the Calgary Radio Emergency Net assisted the Canadian Legion in a polio drive. The local radio station CKXL broadcast a 4-hour program calling for telephoned bids. These bids were relayed on 75 meters to hamshacks around the town where the Legion had stationed cars, which were then sent around the district to pick up the donations. About \$4000 was collected for the fund. Fifteen amateurs participated from seven stations in Calgary.

7) We don't know the date of the telethon in Longview, Texas, but word from W5AFR via SCM W5JQD is that the Longview Amateur Radio Club and other amateurs in the district assisted in communications between various county headquarters and KTVE. Operation was on 160 and 80 meters, with six amateurs at the TV station, for 21 hours. Donations, says W5AFR, were around \$22,000.

8) In Bangor, Maine, mobiles of the Bangor Civil Defense Corps assisted in supplying communications for the Mothers' March in Bangor and Brewer. The mobiles were stationed at strategic points, with a control station dispatching them to points in the two cities as needed. Twelve amateur mobile units assisted in this operation.

## A.R.R.L. ACTIVITIES CALENDAR

July 2nd: CP Qualifying Run — W6WP  
 July 11th: CP Qualifying Run — W1AW  
 July 16th-17th: CD QSO Party (c.w.)  
 July 23rd-24th: CD QSO Party (phone)  
 Aug. 5th: CP Qualifying Run — W6WP  
 Aug. 16th: CP Qualifying Run — W1AW  
 Sept. 3rd: CP Qualifying Run — W6WP  
 Sept. 14th: CP Qualifying Run — W1AW  
 Sept. 15th: Frequency Measuring Test  
 Sept. 17th-18th: V.H.F. QSO Party  
 Oct. 7th: CP Qualifying Run — W6WP  
 Oct. 8th-9th: Simulated Emergency Test  
 Oct. 13th: CP Qualifying Run — W1AW  
 Oct. 15th-16th: CD QSO Party (c.w.)  
 Oct. 22nd-23rd: CD QSO Party (phone)  
 Nov. 5th: CP Qualifying Run — W6WP  
 Nov. 12th-13th, 19th-20th: Sweepstakes  
 Nov. 18th: CP Qualifying Run — W1AW

### Mare-Than-One-Operator Stations

W6YDK 187 VE5DR 126

BPL medallions (see Aug. 1954 QST, p. 64) have been awarded to the following amateurs since last month's listing: W1EEO, K2CQP, W3RV, W4PL, W5YHM, W7VAZ, W9AA.

The BPL is open to all amateurs in the United States, Canada, Cuba, and U. S. possessions who report to their SCM a message total of 500 or more, or 100 or more originations-plus-deliveries for any calendar month. All messages must be handled on amateur frequencies, within 48 hours of receipt, in standard ARRL form.

## BRIEF

The Connecticut 'Phone Net is finding certain information made available by the telephone company's central and regional offices most valuable. For delivery of radio traffic the NCS and many net members are using the publication *Connecticut Localities Telephone Exchanges*, available to subscribers on request. This lists all Connecticut towns and under what main city exchanges they come. Another helpful publication is *Central Office Names*, also free on request from the New Haven office of the Southern New England Telephone Company. WILIG suggests that traffickers in other parts of the nation secure parallel publications to aid in delivery of radiograms.

## DXCC NOTES

Our DXCC Note this month will clarify the case of Corn Islands with regard to our DXCC. QSLs for Corn Islands count for Nicaragua only. Information currently originating with the United States Department of State indicates Corn Islands are solely under the administration of Nicaragua. Our FCC is fully cognizant of the position taken by the

Department of State. Therefore, any QSL submitted for DXCC credit from Corn Islands must be viewed with attention to Rule #7 of the DXCC rules which provides that only the calls issued by the administering government or licensing authority will be recognized.

The question of the distance of the Corn Islands from Nicaragua was raised in some correspondence. In view of these being only 35 miles removed from the parent country there would be no adequate precedent to justify country status on the basis of distance. (See page 68, May QST, Country Considerations, point 2.)

## CODE-PROFICIENCY PROGRAM

Twice each month special transmissions are made to enable you to qualify for the ARRL Code Proficiency Certificate. The next qualifying run from W1AW will be made on July 11th at 2130 EDST. Identical texts will be sent simultaneously by automatic transmitters on 1885, 3555, 7125, 14,100, 21,010, 52,000 and 145,600 kc. The next qualifying run from W6OWP only will be transmitted on July 2nd at 2100 PDST on 3590 and 7138 kc.

Any person may apply; neither ARRL membership nor an amateur license is required. Send copies of all qualifying runs to ARRL for grading, stating the call of the station you copied. If you qualify at one of the six speeds transmitted, 10 through 35 w.p.m., you will receive a certificate. If your initial qualification is for a speed below 35 w.p.m., you may try later for endorsement stickers.

Code-practice transmissions will be made from W1AW each evening at 2130 EDST. Speeds are 15, 20, 25, 30 and 35 w.p.m. on Monday, Wednesday and Friday, and 5, 7½, 10 and 13 w.p.m. on Sunday, Tuesday, Thursday and Saturday. Approximately 10 minutes' practice is given at each speed. References to texts used on several of the transmissions are given below. These make it possible to check your copy. For practice purposes the order of words in each line of QST text sometimes is reversed.

Date Subject of Practice Text from May QST

- July 5th: The "Z-Match" Antenna Coupler, p. 11
- July 8th: Automatic Mobile Antenna Tuning, p. 14
- July 12th: Vertical Multiband Antennas, p. 19
- July 14th: Six Meters for the Beginner, p. 22
- July 18th: Easy Shielding for Ninety Watts, p. 25
- July 21st: The All-Electronic "Ultimate" Keyer, p. 36
- July 26th: 21st ARRL Sweepstakes Results, p. 44
- July 29th: The World Above 50 Mc., p. 57

## W1AW SUMMER SCHEDULE

(All times given are Eastern Daylight Saving Time)  
Operating-Visiting Hours:

- Monday through Friday: 1300-0100 (following day).
- Saturday: 1900-0230 (Sunday).
- Sunday: 1500-2230.

Note: W1AW will be closed from 2230 July 3rd to 1300 July 5th in observance of Independence Day. From July 25th through August 25th, W1AW operating-visiting hours weekdays will be from 1900 to 0100, to provide for attendants' vacations.

A mimeographed local map showing how to get from main highways (or from HQ. office) to W1AW will be sent to amateurs advising their intention to visit the station.

Official ARRL Bulletin Schedule: Bulletins containing latest information on matters of general amateur interest are transmitted on regular schedules. Frequencies:

- C.w.: 1885, 3555, 7125, 14,100, 21,010, 52,000, 145,600 kc.
- 'Phone: 1885, 3945, 7255, 14,280, 21,350 kc.; 52,145.6 Mc.

Times:

Sunday through Friday, 2000 by c.w., 2100 by 'phone.

Monday through Saturday, 2330 by 'phone, 2400 by c.w.

General Operation: Use the chart on page 70, May QST, for determining times and frequencies for W1AW general contact with any amateur. Note that since the schedule is organized in EDST, the operation between 0000 and 0100 each day will fall in the evening of the previous day in western time zones.

Code-Proficiency Program: Practice transmissions at 15, 20, 25, 30 and 35 w.p.m. on Monday, Wednesday and Friday, and at 5, 7½, 10 and 13 w.p.m. on Sunday, Tuesday, Thursday and Saturday are made on the above-listed frequencies. Code practice starts at 2130 each day. Approximately 10 minutes' practice is given at each speed. On July 11th and August 16th instead of the regular code practice, W1AW will transmit certificate qualifying runs.

• All operating amateurs are invited to report to the SCM on the first of each month, covering station activities for the preceding month. Radio Club news is also desired by SCMs for inclusion in these columns. The addresses of all SCMs will be found on page 6.

## ATLANTIC DIVISION

**EASTERN PENNSYLVANIA** — SCM, W. H. Wiand, W3BIP — SEC: IGW, RM: AXA, PAM: PYF, E. Pa. Nets: 3610, 3850 kc. Notice to all amateur radio clubs of E. Pa.: Your SCM will be happy to include all information such as news items and announcements of interest to all in this column each month. However, in order to be certain that this information can be used, kindly use the following as a guide. (1) Mail your news items to the SCM (address page 6) no later than the first of each month. (2) Two months will have elapsed between the time it is received by your SCM and its appearance in this column. A club bulletin is fine but in most cases it is not received in time and does not contain items that will be of interest to the gang two months later. Make it your duty as a member of a club to bring this to the attention of your president so that he may appoint someone to furnish the SCM with the items you want to appear in this column. The West Phila. RA reports concentrating its Field Day efforts in the two-transmitter class with operators being AHP, BVD, DVB, FMI, OWK, RKP, VCE, YDB, YHM, and ZIA. The Mike Farad Radio Club, with club station YDX located in the Tech. Rep. Division of the Philco Corp., operates the Mike Farad Traffic Net daily from 12:15 to 1:15 P.M. EST and is on for ragchews every Sat. morning on 3815 kc. Members of the Abington Township Area presently in the armed services took leave in order to be present for Field Day. RFI came all the way from El Paso, Tex., while PDJ drove up from Baltimore. The newest member of the Club is AUF, the son of QV. He will have a 10-meter mobile unit in his 14-ft. outboard boat. Bill Shaw, ex-3AAD, is back on the air with a Viking I and an SX-71, plus a new call, BUR. FPC, NJS, VNP, and VSC, members of the South Phila. AR Club, received citations for their work during Hurricane Hazel. AXA reports the date of the E. Pa. picnic will be Aug. 14th. The place, a central location, will be announced later. The Philmont Mobile Radio Club is planning a documentary film on its activities. With 25 present it walked off with the prize at the Old Timers' Nite Roundup for having the largest club attendance there! Traffic: (Apr.) W3CUL 656, OK 233, BFF 208, WUE 155, OZV 107, UKJ 104, GES 88, DU1 82, YAZ 81, AXA 52, WYV 50, WQL 36, PYP 34, UOE 33, ELI 26, PVP 21, PVP 14, EAN 9, ZBD 9, TTW 8, ABT 5, JNQ 5. (Mar.) W3UOF 35, ELI 23, BES 4.

**MARYLAND-DELAWARE-DISTRICT OF COLUMBIA** — SCM, John W. Gore, W3PRL — Maryland has at last been added to the list of states now having laws granting the issuance of automobile call letter license plates. This move was initiated originally five years ago and after having been passed and vetoed twice by the Governor, it finally passed again and was signed by the Governor on Apr. 26, 1955. The Law becomes effective May 1, 1956 and provides that call letter license plates may be displayed only on radio-equipped vehicles. Meetings have been held with the Commissioner of Motor Vehicles Office for the purpose of establishing procedures for applications for tags, and a tentative program has been formulated. However, after some has been finalized, information will be sent to all Maryland amateurs for their guidance. YQD discussed "Simplicity and Portability of 220-Mc. Gear" at the Chesapeake Amateur Radio Club on Apr. 25th. UE is looking for stations north and northwest of Baltimore to QNI on MDD C.D. Nets at 1915 EST on 3650 kc. for traffic-handling. ERW now is active on 20-meter phone from Harundale with a new homemade Minibeam. WPF has a new DX-hound Minibeam antenna. MCG made 66 contacts in 25 sections in the CD Party after his return home from three weeks in New Mexico. WV is considering keeping the MDD Net open throughout the summer instead of closing down as usual. WV was one of the Guests of Honor at the recent Old Timers Round-Up in Trenton. The Eastern Shore Amateur Radio Club presented a movie "Basic Electricity — A Must for the Novice" at the Dutch Inn,

Laurel, Del., on Apr. 29th. BKE is looking for schedules, any band, any time. CDQ is looking for instructors for the Washington Radio Club code class, which is going strong. EEB has returned from a trip to South America and visited KV4AH, PJ2CJ, and CP7NM. DRD is building a new final for a pair of 4-125As. The Pikesville Amateur Radio Klub has just been formed with the station call CBW. RV has been busy assembling test equipment for the building project reported last month. BWT and AKB are temporarily off the air because of moving to a new QTH. PKS has been appointed SEC for the Md.-Del.-D.C. section and WG has been appointed EC for Prince Frederick County. Traffic: (Apr.) W3WG 661, WV 619, WBJ 404, UE 249, MCG 86, COK 83, RV 76, PKC 36, CQS 15, PQ 12, EQK 11, OYX 10, BKE 2, BUD 2. (Mar.) W3ONB 94, MCG 22, HC 18.

**SOUTHERN NEW JERSEY** — SCM, Herbert C. Brooks, K2BGJ — SEC: ZVW, PAM: ZI. Early reports on the April 30th RACES Test indicate high participation and plenty of traffic handled, especially at area level. The Burlington County Radio Club members, under the direction of UA, the Radio Officer and EC for Area 10, installed the equipment at Area 10 Headquarters and manned it during the Test. The Camden County Area was well covered during the test by SJRA mobile units, with EWN directing the net. RG was alternate net control on 3505.5 kc. ZI reports very favorable results in the Mercer County Area. K2CEF is doing a swell job reporting on activities in the Pleasantville-Atlantic City Area. DZU is the proud owner of a Johnson KW. CGP has a new receiver and K2CIR, K2IIBA, and W2INJ also are owners of new equipment. CEF reports increased 2-meter and s.s.b. interest in Atlantic County. K2HBA had received his General Class license. YRW is heard nightly on the 2-meter traffic net. ATJ, Mr. Holly, has a new transmitter. BDA is building a Field Day rig. CFP also is building for the big day. Again DVRA put over a swell Old Timers Nite. JWA is to be congratulated on the swell job he is doing as editor of *DVRA News*. K2HZR has a new 100-watt rig and reports DX worked in addition to traffic handled. K2CPR has received the Empire DX Award for his efforts. Jack also is an Official Observer. HDW is heard consistently on NJN. Many thanks for the fine reports and for the interest shown in the section publicity. Keep up the fine work, fellows. ORA reports increased activity on 6 meters. Traffic: W2RG 288, ZVW 80, K2HZR 75, JKC 71, W2HWD 24, ZI 21, K2BGJ 12, W2ASG 11, K2CPR 5.

**WESTERN NEW YORK** — SCM, Edward G. Graf, W2EJV — Asst. SCM: Jeanne Walker, 2B7B. SEC: UTH/FR. RM: RCF, PAMs: TEP and NAL. NYS meets on 3615 kc. at 6 P.M. and 6:30 A.M.; NYSS on 3595 kc. at 3:30 P.M.; NYS on 3925 kc. at 6 P.M.; NYS C.D. on 3509.5 and 3593 kc. at 9 A.M. Sun.; TCPN 2nd call area on 3970 kc. at 7 P.M.; SRPN on 3970 kc. at 10 A.M.; ISPN on 3980 kc. at 3 P.M. K2DJN and K2DJO were appointed co-chairman of RAWNY Field Day. K2HYZ is spending the summer at Lake Placid. K2CLA says his messages handled should be upped when he gets the 813 perking. UTH has a 20-A s.s.b. exciter. K2CEH has a pair of 826s on 2 meters at 300 watts. The RARA V.H.F. meeting was held at the QTH of ELX. TKO represented W.N.Y. at the 1st annual meeting of the low-frequency RTTY in N.Y.C. A c.d. surprise alert in Erie County saw 80 stations out of a possible 84 alerted in less than one hour. Congrats to SSC for being top man for W.N.Y. in the SS. The wishes of your SCM have been realized with the reactivation of the amateur club in Syracuse and vicinity. The first meeting was attended by 90. Meetings are held at the NMP auditorium the 1st Wed. of each month. The KBT meeting was devoted to Field Day planning. K2BRW is at A.F. Base in South Carolina signing /4 and would like to QSO some of the Lockport, Niagara Falls, and vicinity hams any evening on 7265 kc. after 1900 hours EST. He is operating AF4AFI using a Globe King at 400 watts with a 75-A2 receiver. *Corning QRM* states that Dan Rosetti of the American Red Cross spoke at a meeting on "What to do with a Barbequed Ham." First aid was required to revive a ham after an inadvertent contact with a 3000-volt plate supply. WS is active on 40 meters. CXM was QRP until another Variac could be installed. K2CQO left for France and expects to be on 20 meters soon. New RAWNY officers are JPE, pres.; KLF, vice-pres.; TAX, treas.; ICZ, corr. secy.; K2DJN, rec. secy. PPL and DVD are having fun with 2-meter walkie-talkies. RARA officers for the coming year are CTA, pres.; PFI, vice-pres.; SNI, secy.; ZHB, treas. RARA Mobile Club officers are K2ACO, pres.; AKM, vice-pres.; ZZS, secy.-treas. The next meeting will be devoted to a transmitter hunt with FTF in charge and YUT doing the

hiding. QAA is on with a 150-watt Heathkit. K2AMZ has a new B&W. K2KQK dropped the "N" from his call. MHU and K2LWF are on 6 meters. The speaker at the Elmira meeting was Maj. Bill Fields. KN2LBS is a new ham in Machias. Traffic: (Apr.) W2RUF 609, BNC 164, ZRC 116, K21HVZ 111, DSR 92, CLA 78, W2EMW 74, OE 67, K2DJN 64, W2GBX 61, K2AMZ 48, W2HKA 48, COB 33, IEP 30, RQF 20, ZHU 15, FEB 13, UTH 10, KN2JVH 2, (Mar.) W2ZRC 82, WS 12, K2ZJT 10.

**WESTERN PENNSYLVANIA** — SCM, R. M. Heck, W3NCD — SEC: GEG, RMs; UHN, NRE, NUG, and GEG. PAM: AER and LNE. The WPA Net, UHN manager, will operate on 3585 kc. at 1830 EST during the summer. ZKY and VEF are Field Day co-chairmen for the Bucktail Amateur Radio Club. TYC worked the YL/OM C.W. Contest with 30 watts. OLB is now K2KZJ. KYK is active on 160- and 75-meter 'phone. SUL is 10-meter mobile. LEL is on 3.5-Mc. c.w. and 220-Mc. 'phone with code practice most nights at 2030, 5 to 10 w.p.m. on 223.3 Mc. RMX, on 10-meter mobile, is getting better results with PTU at home trying better 10-meter antennas. ZKY is working out well with 25 watts on 75 meters. The Indiana ARC, using club station BMD, joined with other amateurs in a system of tri-state five-city junior rifle match shooting from Grand Rapids, Detroit, Toledo, Pittsburgh, and Indiana, the winners being determined via reports by amateur radio. VKOD had fine DXing on Apr. 23rd, getting DL4ACW, PYGO, VK3AZY, ZS6TE, KASL, and W4DUZ, plus VK9SP and several ZS stations later that day. The Beaver Valley ARC plans a tour of the Greater Pittsburgh Airport communications, radar, and blind-landing equipment. LPI gave a report on the Toledo s.s.b. meeting. VFR and BSF reported on the Dayton Hamfest. CXX and VFR are mobile. The Cambria County C.D. Net maintained a station, UUY, on the 10-meter defense frequency during the Home Show held in the Johnstown War Memorial Arena. The Breeze Shooters Net, Mon. on 29 Mc. at 8 p.m., has SJK giving code practice for beginners between 7 and 8 p.m. Mon. on 29 Mc. A second station, ZDK, will be on soon with practice sessions on Sat. The South Hills Brass-pounders and Modulators hamfest will be held Aug. 7th at South Park. TFU has been forced to drop his SHBPM newspaper activities. The present staff consists of OMP, QOQ, and ZSP. QNI attended open house at Bethel High School, which has a radio club of its own. VFR visited UJP on 10-meter mobile and in person. NBQ and TTB are on 10 meters. RUX has completed mobile and is on 10 meters with a fine signal. LDB is figuring on adapting his mobile to his truck. VKU is furnishing the truck for the SHBPM Field Day. The Radio Association of Erie has placed its summer hamfest in the capable hands of QPP and NXX. The RAE Field Day will be under the chairmanship of TXZ, assisted by WDK and STK. New calls around Erie are WN3s BUY, BYM, BYR, BVQ, and BQE. The RAE has crystals available for use by the Novices. Traffic: W3NRE 222, LMM 199, UHN 52, GEG 30, KUN 27, NCD 16, SIJ 14, KNQ 13, VKD 12.

## CENTRAL DIVISION

**ILLINOIS** — SCM, George T. Schreiber, W9YIX — Section Nets: ILN, c.w., Mon. through Sat. 3515 kc.; IEN, 'phone, 3940 kc. SEC: HOA, RMs; BUK and MRQ. PAM: UQT, EC Cook County: HPG. The Chicago YLRL observed its second anniversary Apr. 23rd with an open house for the OM and dedicated the club station. DEQ, The President is SEZ, secretary is GME. Speakers at the dedication were LZ, QCWA pres., HPC, Fritz, Franke; Bill Halligan jr.; and your SCM. More than 85 Novices have been graduated from the QCWA code class, which has closed down for the summer. The class totaled an average of 125 per session. Instructors and examiners were CYD, EVA, and MHK. More than 1000 amateurs are represented by the Chicago Area Radio Club Council, it was announced by President HPG. MD values his collection of old-time photographs representing early amateur radio in the section. EPI would like to see a tri-state (Central Division) c.d. drill and talks it up. UQT, the Central Division Director, gets around visiting clubs and ham gatherings. DO, YWL, CSW, IDA, and VSX made BPL this month. It's the 13th BPL for DO. DKW, formerly of the Starved Rock Club, now has plenty of room for skywires, he writes from Prescott, Ariz., and will be on 40 meters soon. ABS is talking about getting on the air from the new QTH in Rock Island. LIC is enjoying 20 meters after more than a year's absence. K4ATN visited Vice-Director QJZ. ZEN, and many others of the down-State gang. ZEN hopes by this time to have his cruiser launched on the Illinois River. PHE had frequency drift in the rig but eliminated it with the help of IFA. Now he is going to tackle repairs to the beam. FRP has moved his shack into a new trailer home. USI now puts out Official Bulletins on 40, 6 and 2 meters as band activity indicates. IDA now is on s.s.b. and likes the s.s.b. session of IEN each Wed. at 1730. PVD obtained a 35-foot pole for a skywire. SKR is busy trying to eliminate chirp in the BC-459. Novice JZK has a new Globe Scout. New Novice calls are PGB and NST. BA has been busy organizing a back-up net in Belleville for the city police; now the sheriff wants the same thing. HUX has his vertical perking and likes it. Congrats to BRD and his XYL on the

arrival of a second jr. operator. If it's a contest you are listening to you always hear GDI, while his brother LI hardly ever stirs from 20 meters. Both KJ and BUK now have their kw. rigs going and BUK won his fight with the Evanston village fathers, who finally gave him permission to erect a 60-foot tower. EVA says we insulted him last month when we associated him with a teletypewriter. It's a teleoperator, he says, which sends out dots and dashes. HPI, one of the leading f.m. exponents, was heard on a.m. and working off the frequency of 147.5 Mc. UD deplores the fact that so many new General Class licensees rush to build modulators. The Cenozoic Amateur Radio Assn. gets out an interesting news letter. Officers of the group are MUO, TLE, and UFR. C.d. seems to be picking up. SEC HOA announced the issuance of EC certificates to GLR, BLO, EAD, SXU, VSX, MRT, and NGG, all active hams. NGG incidentally works a police circuit all day for the State Police at Pontiac but still enjoys hamming. Traffic: (Apr.) W9YWL 856, DO 846, IDA 669, SCW 549, VSX 454, AA 243, SME 132, QQG 116, VHD 54, CEE 42, YLN 40, BUK 34, MRQ 29, ZMJ 26, LXL 22, USI 22, VEY 21, VER 14, CTZ 12, FRP 12, BA 8, PHE 4, STZ 2, (Mar.) W9VSX 203, BA 7.

**INDIANA** — SCM, George H. Graue, W9BKJ — The Indiana Radio Club Council met at Purdue University April 17th. Delegates from 24 clubs approved plans for a section Field Day Contest with a plaque to the winning club. The agenda for the Central Division Convention at South Bend Oct. 15th and 16th was presented. Those making BPL for the month are NZZ, TT, and JUJ. NZZ received the G.E. Co. Hurricane Edison Award for 1954 and also received a plaque from England for traffic-handling for a scientific expedition in the Far North from 1952 to 1954. WVT reports traffic for IEN as 151. EHJ reports CAEN traffic as 35 for 19 sessions. The XYL of SNT is TNV at Stroh. RBV is 2-meter mobile. FJS is the new Vermillion Co. EC. JSV has a code class of 19. N9VAI is new at Rockville. BYN has a new B&W rig. IU has a new Mosley 40 meter beam. BJF made WAS in 5 weeks. N9UBF is new at Elwood. ZGC is rebuilding. AB again is active on IFN daily. WTY is the new station manager of club station AB. RBE is new at Borden with a Viking II. HSG has 614hz in a homebrew rig. NTA reports 50 sessions with a traffic total of 202 for IFN. NTA and GHK took a Cub Scout Troop on a tour to Grassyfork Fisheries. PNE has worked 40 countries on 160 meters. BBE finally has his TR-75 working on 20 meters. FHA has a Viking Adventurer. YZO has WAS on 75-meter 'phone. TT has the new rig working. FB, JUJ may be inactive until September. VNY and KDY are on a vacation cruise in the Mediterranean Sea. DHJ now has seven states worked on 2 meters. N9SIX and TDI are new at Jeffersonville. LSJ has a new VFO. N9RYH is new at Peru. ZIB has a new B&W rig. FSA is active on 6 meters. DKR has an RME-55 converter in the car. FWRC is changing the mobile net from 10 to 6 meters, with about 60 units to change over, plus the same numbers of converters to build under a club project. UDD is heading this change. Traffic: W9NZZ 920, TT 919, JUJ 512, TQC 180, EHJ 138, VNV 120, UQP 96, JBQ 80, WBA 76, TG 62, STC 58, WNV 58, WRO 58, BKJ 57, DHJ 52, ZYK 49, PQ4 47, QYQ 37, NTA 35, CTF 33, QR 31, SVL 26, HRY 23, AZF 21, FGX 19, AQR 13, KDV 12, ZRP 12, CMIT 11, ACN 10, CC 10, DOK 10, GDL 10, AB 8, S 8, ZIB 8, BDP 7, EOO 6, FSA 6, DGA 5, YVS 4, DPR 3.

**WISCONSIN** — SCM, Reno W. Goetsch, W9RQM — SEC: OVO. PAMs: ESJ and GMY. RMs: IXA, RTP, and UNJ. Nets: BEN, 3950 kc., 6 p.m. daily; WIN, 3685 kc., 6 p.m. daily; WPN, 3950 kc., 1215 Mon.-Sat., 0930 Sun. Wisconsin mobile c.d. frequency: 29,620 kc. CCO worked a KLT and reports he will be leaving for the Navy in October. W9NUGC is new in Plainfield. BTN is running 700 watts to a BC-610. KXA has returned from overseas, and has resumed skeds with OM KWJ from 3PQT. In the April CD Party RKP made 51,695 points while DIK finished with 29,600 points. IU built a new Heath DX-100 transmitter. Net certificates (WPN) were issued to CFO, GHJ, GHT, KKK, KKM, and UTN. WYE has a new Harvey Wells Deluxe and is active on 50 Mc. DVM is using a Viking Ranger, NC-183D, Matchbox, D104, and a VHF-152A. 0TLE was guest speaker at NWRC's April meeting. New officers of the WVRA (Wausau) are JBF, pres.; FZC, vice-pres.; CFN, secy.; LED, treas.; RQM, custodian. TBI, ZJJ, YZS, MQC, and IAL, of Rhineland, and SJL, YUB, and SQJ, of Minocqua, are new members of WVRA. IAL has a new SX-43 and is new MARS member and OBS. ZJJ operated portable from the high school in a demonstration. W9MLO has a TR-75 and an SX-42. W9UMK runs 30 watts to a 6L6 and S-20R. During the Apr. 15th opening on 144 Mc. LEE worked KPS, EQC, EHX, PPA, AAG, QWT, LJV, GFL, and GDP and heard 4PCT. AFS is back on 7 Mc. with a Globe Scout. FIA and AQN are working 4-Mc. 'phone. AFS and QGR are looking for former instructors of AACSS schools at Truax and Scott. ZNA is building a radio-controlled plane. YNB is scouting for DX on 7 Mc. OVO now has the mobile set for rapid band change. New ECs: AJU for Ashland and Bayfield Co., and FFC for Waushara Co. VHA and JBF have handie-talkies in operation on 29,620 kc. Plan now to attend the Central Division Convention at So. Bend, Ind., Oct. 15-16. Traffic: W9CXY 504, SAA 251, CCO 139, FFC 108, BTN

(Continued on page 82)

## "More Roads to Rome Than One"

**S**ELECTIVITY in the last few years has become more and more of a major interest to the radio amateur, not only from a theoretical discussion but also from a practical operating standpoint, because of the recent advent of at least three manufactured receivers offering a degree of selectivity that was unobtainable at almost any price just a few years ago.

**T**HE theoretical analysis and mathematical tools to develop narrow passband systems are not basically new, having been first presented in text form by Shea in 1929. Shea's original work covered filters only from an electrical standpoint, but from his concepts, others (such as Mason in 1942) have developed low-pass, high-pass and band-pass networks for acoustic and mechanical systems. Today, therefore, the electronic engineer has quite a few choices as to the method of achieving the selectivity requirements of the customer.

**I**N a theoretical radio receiver, the ideal location for all the selectivity is directly after the antenna and before the first tube of the receiver. As yet, no one knows a practical method of obtaining the required high order of selectivity that is also tunable over a wide band of frequencies. Hence the practical receiver obtains some selectivity in successive stages by variable tuned circuits until the signal is converted to a convenient fixed intermediate frequency at which point the maximum and final selectivity is obtained.

**A**T the I.F. frequency the designer has the choice of only two basic systems and each is composed of resonant elements: the first — electrical resonance and the second — mechanical resonance. To some it may seem somewhat strange if quartz crystals are used in the filter; the filter should be properly described as a "mechanical filter" as the piezo-electrical properties of quartz actually cause a change in the shape of the filter element and therefore the crystal is mechanically vibrating at some specific frequency.

**T**HE corollary can be drawn that other materials exhibiting similar characteristics, such as the magnetostriction effect, could also be employed as filter elements. However, magnetostriction effect, at present, is used mainly for transducer elements in certain mechanical filters. Certain Ferro-ceramic compounds are useful in filters only because of this magnetostriction effect.

**F**OR most amateur work it is a practical necessity that the degree of selectivity be varied over a fairly wide range to encompass different modes of transmission and different band conditions. Thus the design engineer is now faced with another decision: Which of the two basic types of filter systems will meet the customer requirements better and still be economically practical? Of even greater importance, which of the two systems is worthy of further research for possible application to amateur receivers and transmitters?

**A**T the present state of the art the only system whose passband can be varied over the necessary range without complete substitution of a new network is the "electrical." The mechanical systems offer somewhat better skirt selectivity (for a given physical size) but at a considerable increase in cost and, to change the passband, complete additional filters must be added. Thus, at the present date, it seems that the electrical system is way out ahead from the important cost point.

**T**HE well-known bandwidth formula  $BW = \frac{F_r}{Q}$  clearly shows that when  $Q$  can be maintained the electrical systems are primarily for low frequencies, 25 to 200 kc. At these frequencies a mechanical filter becomes quite large. For example — some 50 kc. filters that we made were  $\frac{1}{2}$ " x  $\frac{1}{2}$ " x 14". At higher frequencies the physical size of mechanical resonating elements becomes so minute that production problems become insurmountable. Thus, mechanical filters employing elements other than quartz are practical at present only in the frequency spectrum from about 250 to 700 kc.

**F**OR the higher frequencies we have only one alternate to consider, and that is mechanical filters employing the piezo electric effect. Of all the materials exhibiting this effect only quartz has the necessary physical properties, permitting the fabrication of thin, small elements which can be combined into a filter network. The upper frequency limit of quartz filters is quite high and may reach as much as 15 to 20 Mc.

**T**HE fabrication of quartz crystals has progressed amazingly since 1940 and, likewise, the scientific knowledge of the application of quartz elements in bandpass networks. It seems logical, therefore, that further research may soon find methods of obtaining adjustable passbands with one crystal network, thus affording a very versatile new device for the design engineer.

—Fritz Franke

# NOW

# a BROAD-BAND\* LINEAR

MULTIPHASE  
**600 L**  
NO TUNING  
CONTROLS

SINGLE KNOB  
BAND-SWITCHING  
10-160

FOR USE ON  
SSB, AM, PM & CW

WIRED, WITH TUBES AND  
BUILT-IN POWER SUPPLY **\$349.50**

## a new concept in linears

CENTRAL ELECTRONICS takes pride in presenting a product of intensive research — the new Multiphase 600L Broad-band\* Linear. "It is destined to change the entire concept of RF amplifier design in the military, commercial and amateur fields." There are no tuning controls, servos or moving parts other than band-switch.

- Single 813 in Class AB<sub>2</sub>.
- New band-pass couplers provide high linear efficiency: 60 to 65%.
- Designed for 50 — 70 ohm co-axial input and output.
- Easy to drive — Approx. 2 watts effective or 4 watts peak drive power required for 500 watts DC input.
- Built-in power supply — bias and screen regulation, 45 mfd. oil filled paper output capacitor. Excellent static and dynamic regulation.
- Extremely low intermodulation distortion.
- Automatic relay protects 813 and RF couplers.
- Excellent stability — complete freedom from parasites.
- Effectively TVI suppressed — RF compartments thoroughly shielded and Hypassed.
- Choice of grey table model, grey or black wrinkle finish rack model.
- Table model cabinet size — 17 $\frac{1}{8}$ " W, 8 $\frac{3}{4}$ " H, 13" D.

## Another C.E. First!

METER FEATURES NEVER BEFORE  
FOUND IN A TRANSMITTER

- Reads power input directly in watts
- Reads grid current
- Instantly reads output in RF amperes — no lagging thermocouple
- Indicates reflected power caused by mismatched load
- Calibrated input levels for AM, PM and CW.  
... and switch the meter to any position while transmitting!

**MODEL AQ**

**MODEL DQ**

**MODEL B SLICER**

# NEW MULTIPHASE "Q" MULTIPLIER AVAILABLE THREE WAYS

1. It's built-in the new Model B Sideband Slicer.
2. Plug it into your present Model A Slicer.
3. Attractive Desk Model, for installation directly into receiver.

The new Multiphase "Q" MULTIPLIER is a tunable IF electronic filter that provides tremendous receiver selectivity for peaking or rejecting a signal on AM, CW or SSB. It employs a new two tube circuit\* with a special very high "Q" pot core inductor. Continuously variable selectivity from 60 cps to normal IF pass-band. Nulls out interfering heterodynes without affecting speech intelligibility. Peak the desired signal; interfering carriers are attenuated up to 50 db.

\*PATENT PENDING

**MODEL 20A**

- 20 Watts Peak Envelope Output SSB, AM, PM and CW
- Completely Bandswitched 160 thru 10 Meters
- Magic Eye Carrier Null and Peak Modulation Indicator

Choice of grey table model, grey or black wrinkle finish rack model.

Wired and tested.....\$249.50  
Complete kit.....\$199.50

## 458 CONVERSION KIT

Basic 458 Conversion Parts Kit, 15 to 160 meters, with dial, etc.....\$15.00  
458 Deluxe Case and Panel Kit, matches size and appearance of Slicer...\$10.00

## NEW — FOR 10 METERS

MODEL 458-10 xtal controlled converter package to extend 458 VFO into 10 meter band. For use with above 458 Conversion Kits.  
Wired.....\$37.50  
Kit.....\$27.50

## MODELS MODEL AQ

"Q" MULTIPLIER for installation in Model A Slicer. Includes new front panel. Power-IF cable plugs into accessory socket.

Wired...\$29.50 Kit...\$22.50

## MODEL DQ

Desk Model "Q" MULTIPLIER for use with any receiver having 450 to 500 KC IF. In attractive case 5 1/2" W, 4" H, 5" D, with connecting power-IF cable. Power requirements, 225 to 300 VDC at 12 ma., 6.3 V at .6 amps, can be secured from receiver. Can provide added selectivity and BFO for mobile SSB or CW reception.

Wired...\$29.50 Kit...\$22.50

## MODEL B

Sideband Slicer, same as Model A Slicer but includes built-in "Q" MULTIPLIER. AP-1 not needed.

Wired.....\$99.50  
Kit.....\$69.50

## Check These Features NOW IN BOTH MODELS

- **Perfected Voice-Controlled Break-in** on SSB, AM, PM.
- **Upper or Lower Sideband** at the flip of a switch.
- **New Carrier Level Control.** Insert any amount of carrier without disturbing carrier suppression adjustments.
- **New Calibrate Circuit.** Simply talk yourself exactly on frequency as you set your VFO. Calibrate signal level adjustable from zero to full output.
- **New AF Input Jack.** For oscillator or phone patch.
- **CW Break-in Operation.**
- **New Gold Contact Voice Control Relay.** Extra contacts for muting receiver, operating relays, etc.
- **Accessory Power Socket.** Furnishes blocking bias for linear amplifier and voltage for optional VFO (Modified BC458 makes an excellent multiband VFO.)
- **40 DB or More Suppression** of unwanted sideband.

## SIDE BAND SLICER

### MODEL A IMPROVES ANY RECEIVER

Upper or lower sideband reception of SSB, AM, PM and CW at the flip of a switch. Cuts QRM in half. Exalted carrier method eliminates distortion caused by selective fading. Easily connected into any receiver having 450-500 KC IF. Built-in power supply. Reduces or eliminates interference from 15 KC VFO receiver sweep harmonics.

Wired and tested.....\$74.50

Complete kit.....\$49.50

## AP-1 ADAPTER

Plug-in IF stage — used with Slicer, allows receiver to be switched back to normal.

Wired and tested, with tube....\$8.50

## NEW AP-2 ADAPTER

Combined AP-1 and xtal mixer. Allows Slicer to be used with receivers having 50, 85, 100, 915 KC and other IF systems. One xtal suffices for most receivers.

\$17.50

## MODEL 10B

### SUCCESSOR TO THE POPULAR MODEL 10A

- 10 Watts Peak Envelope Output SSB, AM, PM and CW
- Multiband Operation using plug-in coils.

Choice of grey table model, grey or black wrinkle finish rack model. With coils for one band.

Wired and tested.....\$179.50  
Complete kit.....\$129.50

## QT-1 ANTI-TRIP UNIT

Perfected Voice Operated Break-in with loudspeaker. Prevents loud signals, heterodynes and static from tripping the voice break-in circuit. All electronic — no relays. Plugs into socket inside 20A or 10B Exciter.

Wired and tested, with tube....\$12.50

# New Heathkit VFO KIT

MODEL VF-1

**\$1950**

Ship. Wt. 7 lbs.

Here is the new Heathkit VFO you have been waiting for. The perfect companion to the Heathkit Model

AT-1 Transmitter. It has sufficient output to drive any multi-stage transmitter of modern design. A terrific combination of outstanding features at a low kit price. Good mechanical

and electrical design insures operating stability. Coils are wound on heavy duty cement. Variable capacitor is of differential type construction, especially designed for maximum bandspread and features ceramic insulation and double bearings.

This kit is furnished with a carefully precalibrated dial which provides well over two feet of calibrated dial scale. Smooth acting vernier reduction drive insures easy tuning and zero beating. Power requirements 6.3 volts AC at .45 amperes and 250 volts DC at 15 mills. Just plug it into the power receptacle provided on the rear of the AT-1 Transmitter Kit. The VFO coaxial output cable terminates in plastic plug to fit standard 1/4" crystal holder. Construction is simple and wiring is easy.

- Smooth acting illuminated and precalibrated dial.
- 6AU6 electron coupled Clapp oscillator and OA2 voltage regulator.
- 10 Volt average output on fundamental frequencies.
- 7 Band calibration, 160 through 10 meters, from 3 basic oscillator frequencies.

Open layout—easy to build—simplified wiring.

Smooth acting illuminated dial drive.

Clean appearance—rugged construction—accessible calibrating adjustments.

Ceramic coil forms—differential condenser.

Copper plated chassis—careful shielding.

## Heathkit AMATEUR TRANSMITTER KIT

MODEL AT-1

**\$2950**

Ship. Wt. 16 lbs.

### SPECIFICATIONS:

Range 80, 40, 20, 15, 11, 10 meters.  
6AG7 ..... Oscillator-multiplier.  
6L6 ..... Amplifier-doubler  
5U4G ..... Rectifier.  
105-125 Volt A.C. 50-60 cycles 100 watts. Size: 8 1/2 inch high x 13 1/2 inch wide x 7 inch deep.

Crystal or VFO excitation.

Rugged, clean construction.

Prewound coils—metered operation.

52 ohm coaxial output.

Single knob band switching.

Built-in power supply.

Here is a major Heathkit addition to the Ham radio field, the AT-1 Transmitter Kit, incorporating many desirable design features at the lowest possible dollar-per-watts price. Panel mounted crystal socket, stand-by switch, key click filter, A. C. line filtering, good shielding, etc. VFO or crystal excitation—up to 35 watts input. Built-in power supply provides 425 volts at 100 MA. Amazingly low kit price includes all circuit components, tubes, cabinet, punched chassis, and detailed construction manual.

## Heathkit COMMUNICATIONS RECEIVER KIT

Four band operation 535 to 35 Mc.

Stable BFO oscillator circuit.

Six tube transformer operation.

Electrical bandspread and scale.

RF gain control with AVC or M.V.C.

5 1/2 inch PM Speaker-Headphone Jack.

Noise limiter—standby switch.

### SPECIFICATIONS:

Range.....535 Kc to 35 Mc  
12BE6 ..... Detector-oscillator  
12BA6 ..... I. F. Amplifier  
12AV6 Detector—AVC—audio  
12BA6 ..... B. F. O. oscillator  
12AF ..... Beam power output  
5Y3GT ..... Rectifier  
105 - 125 volts A. C. 50-60 cycles, 45 watts.

A new Heathkit AR-2 communications receiver. The ideal companion piece for the AT-1 Transmitter. Electrical bandspread scale for tuning and logging convenience. High gain miniature tubes and IF transformers for high sensitivity and good signal to noise ratio. Construct your own Communications Receiver at a very substantial saving. Supplied with all tubes, punched and formed sheet metal parts, speaker, circuit components, and detailed step-by-step construction manual.

MODEL AR-2

**\$2550**

Ship. Wt. 12 lbs.

### CABINET:

Proxylon impregnated fabric covered plywood cabinet. Shipp. weight 5 lbs. Number 91-10, \$4.50.

**HEATH COMPANY**  
BENTON HARBOR 9, MICHIGAN

## New HEATHKIT DX-100

MODEL DX-100

Shpg. Wt. 120 lbs.

**\$189.50**

Shipped motor freight unless otherwise specified. \$50.00 deposit with C.O.D. orders.

- R.F. output 100 watts Phone, 125 watts C.W.
- Built-in VFO, modulator, power supplies. Kit includes all components, tubes, cabinet and detailed construction manual.
- Crystal or VFO operation (crystals not included with kit).
- PI network output, matches 50-600 ohms non-reactive load. Reduces harmonic output.
- Treated for TVI suppression by extensive shielding and filtering.
- Single knob bandswitching, 160 meters through 10 meters.
- Pre-punched chassis, well illustrated construction manual, high quality components used throughout—sturdy mechanical assembly.

## PHONE AND CW TRANSMITTER KIT

This modern-design Transmitter has its own VFO and plate-modulator built in to provide CW or phone operation from 160 meters through 10 meters. It is TVI suppressed, with all incoming and out-going circuits filtered, plenty of shielding, and strong metal cabinet with interlocking seams. Uses pi network interstage and output coupling. R.F. output 100 watts phone, . . . . . 125 watts CW. Switch-selection of VFO or 4 crystals (crystals not included).

Incorporates high quality features not expected at this price level. Copper plated chassis—wide-spaced tuning capacitors — excellent quality components throughout—illuminated VFO dial and meter face—remote socket for connection of external switch or control of an external antenna relay. Preformed wiring harness—concentric control shafts. Plenty of step-by-step instructions and pictorial diagrams.

All power supplies built-in. Covers 160, 80, 40, 20, 15, 11 and 10 meters with single-knob bandswitching. Panel meter reads Driver Ip Final Ig, Ip, and Ep, and Modulator Ip. Uses 6AU6 VFO, 12BY7 Xtal osc.-buffer, 5763 driver, and parallel 6146 final. 12AX7 speech amp., 12BY7 driver, push-pull 1625 modulators. Power supplies use 5Y4 low voltage rect., 6AL5 bias rect., 0A2 VFO voltage reg., (2) 5R4GY hi voltage rect., and 6AQ5 clamp tube. R.F. output to coax. connector. Overall dimensions 20 $\frac{3}{4}$ " W x 13 $\frac{3}{4}$ " H x 16" D.

## Heathkit ANTENNA COUPLER KIT

MODEL AC-1

**\$14.50**

Shpg. Wt. 4 lbs.

Poor matching allows valuable communications energy to be lost. The Model AC-1 will properly match your low power transmitter to an end-fed long wire antenna. Also attenuates signals above 36 Mc, reducing TVI. 52 ohm coax. input—power up to 75 watts—10 through 80 meters—tapped inductor and variable condenser—neon RF indicator—copper plated chassis and high quality components.

## Heathkit GRID DIP METER KIT

MODEL GD-1B

**\$19.50**

Ship. Wt. 4 lbs.

with additional blank dials for individual calibration. You'll like the ready convenience and smart appearance of this kit with its baked enamel panel and crackle finish cabinet.

The Invaluable Instrument for all Hams. Numerous applications such as pre-tuning, neutralization, locating parasites, correcting TVI, adjusting antennas, design procedures, etc. Receiver applications include measuring C, L and Q of components—determining RF circuit resonant frequencies.

Covers 80, 40, 20, 11, 10, 6, 2, and 1 $\frac{1}{2}$  meter Ham bands. Complete frequency coverage from 2—250 Mc. using ready-wound plug-in coils provided with the kit. Accessory coil kit, Part 341-A at \$3.00 extends low frequency range to 350 Kc. Dial correlation curves furnished.

Compact construction, one hand operation, AC transformer operated, variable sensitivity control, thumb wheel drive, and direct reading calibrations. Precalibrated dial

## Heathkit ANTENNA IMPEDANCE METER KIT

MODEL AM-1

**\$14.50**

Shpg. Wt. 2 lbs.

7" long, 2 $\frac{1}{2}$ " wide, and 3 $\frac{1}{4}$ " deep. An instrument of many uses for the amateur.

Use the Model AM-1 in conjunction with a signal source for measuring antenna impedance, line matching purposes, adjustment of beam and mobile antennas, and to insure proper impedance match for optimum overall system operation. Will double, also, as a phone monitor or relative field strength indicator.

100  $\mu$ a. meter employed. Covers the range from 0 to 600 ohms. Cabinet is only

# HEATH COMPANY

A SUBSIDIARY OF DAYSTROM, INC.  
BENTON HARBOR 9, MICHIGAN

# "MC" CAPACITOR . . .

## Offers Wide Choice of Characteristics!

The "MC" is a versatile single-section tuning capacitor designed to give a choice of mountings, connections and capacity characteristics. The threaded brass front-bearing and tapped aluminum end-brackets permit panel or base mounting. A rotor stop permits 180° clockwise rotation for increasing capacity. For optimum performance all Hammarlund "MC" capacitors have silver-plated beryllium copper wiping contact, silicone-treated seatite insulation, soldered nickel-plated brass rotors and stators. The rotor shaft is supported on bearings at both front and rear of capacitor. "MC's" are available with capacities ranging from 5.5 mmf. to 320 mmf.

The Hammarlund Capacitor Catalog lists the complete line of standard capacitors sold by responsible dealers from coast to coast. For your free copy, write to The Hammarlund Manufacturing Co., Inc., 460 West 34th Street, New York 1, New York. Ask for Bulletin C-7.

## DAKOTA DIVISION

**SOUTH DAKOTA** — SCM, J. W. Sikorski, W0RRN — Asst. SCMs: Earl Shirley, 0YQR, and Martha Shirley, 0ZWL. SEC: GCP. PAMs: GDE, BNA, NEO, and PRL. RM: SMV. More than 50 amateurs and civil defense officials met at Mitchell Apr. 17th to make plans for amateur participation in emergency communications. OXC was elected State Amateur Radio Officer and a committee consisting of GDE, PRL; RRN, YQB, GCP, HYQ, and DKJ was appointed to assist him in emergency planning. SMV is trying out a vertical antenna. KXZ signed 5 new ARV members and an Assistant EC for Brookings County. The South Dakota Convention, sponsored by the Prairie Dog ARC, is scheduled for Sept. 3-4 at Yankton. Prizes, in order of scoring, in the second annual SODAK QSO Party were won by PRL, RMK, GDE, TAS, SCT, BNA, IUK, DIY, TYC/0, ZWL, NWM, MZJ, and CTZ. Ray Lischka, ex-00JQ, is operating 14 Mc. from Greenland as KG1FR and DTB, operating as KNSGN, wants skeds with South Dakota. New calls: KN0AOR, and KN0ACX. Net reports: NJQ Net, average QNI 20, traffic daily average 4.5; SD-75, total QNI, 1196, traffic daily average 8; 150 Net, April 1-15, QNI 152, traffic 13. The 160-Net has suspended operations until Oct. 1. Traffic: W0SMV 153, GDE 114, GCP 55, SCT 44, BNA 28, BQH 27, RRN 11, AYD 9, RSP 4.

**MINNESOTA** — SCM, Charles M. Bove, W0MXC — Asst. SCM: Vince Smythe, 0GGQ. RMs: DQL and KLG. PAMs: JIE and UCV. The St. Paul Radio Club held its annual election. Results were: TRD, pres.; LPX, vice-pres.; PAK, secy.; and EUW, treas. After a nice trip along the California Coast QNY and his XYL returned full of vigor and set up a new net to cover Northern Minnesota. It is to be known as the Koochiching Emergency Net and meets Thurs. evenings on 3930 kc. for traffic and emergency drills. This will make a total of nine nets operating in this section. The Marshall Hamfest sure was a big success with an attendance of over a hundred hams from Minnesota and the Dakotas. Principal speakers were Division Director PHR, SEC GTX, and Civil Defense Director Mathies. TLE gave an excellent talk on s.s.b.s.c. with demonstrations on its operation. URQ displayed some of his emergency transceivers that he had written up in one of the trade magazines. KJZ says the YLs are planning a YL net on 3838 kc. to meet at 11:00 A.M. on Tue. It will be called "The PI Net." BUO has built a 5BP1 into his rig for a modulation monitor. The Single-Sidebanders had a big day at Willmar with a big dinner and plenty of speakers. According to SW the only way to get the greatest occupancy of the existing bands is to operate s.s.b. VBD has a new wired and TVI-tested Viking II on the air. QDP built a two-element beam for 15 meters. 7RNV has been mobilizing in the State and has been working a lot of the gang. TQQ is back home after a three-month vacation in Hawaii. MXC and his XYL attended a Hawaiian mobile club meeting while out there. The KH6s use 40 meters on their mobile hunts. CO has a new 75-A4 and is chasing 10-meter DX. LUX built a new four-element beam for 20 meters. Traffic: W0KLG 228, MVH 159, KJL 139, QDP 130, WMA 116, DQL 97, TKX 89, IRJ 71, KJZ 67, KFN 62, TUS 55, MVJ 52, RVD 46, HGW 45, GTX 36, MBD 34, UCV 32, LST 28, HUX 27, RLQ 27, LUX 23, OSJ 17, HKJ 14, UKY 14, VBD 14, BUO 11, KNR 11, FOA 10, TOK 8, OPA 7, MXC 6, PUO 6, LIG 5, QVR 5, VCU 5.

## DELTA DIVISION

**ARKANSAS** — SCM, Owen G. Mahaffey, W5FMF — New appointees are VAN, CAF, and MU as ECs; JZL and WUN as ORS; and TIA as OES. YHT writes from Germany that he is in the Air Force Signal Corps operating DL4TA with 500 watts on 20 meters, usually on 14,190 or 14,310 kc., and hopes to hear some of the gang. YZI reports his code class at the Ozark Academy is about ready for the Novice Class examinations. Both the c.w. and 'phone nets are getting along in fine shape, so get your traffic on 3790 or 3810 kc. and we can put it almost any place. Gang, let's have more news. Radio clubs, please appoint a reporter to send in the news. Traffic: (Apr.) W5CAF 64, SXM 47, WUN 44, FMF 23, PX 3, JZL 2. (Mar.) W5SXM 26.

**LOUISIANA** — SCM, Thomas J. Morgavi, W5FMO — A single-sideband dinner was held at Baton Rouge with ABS, ACS, DLA, EKY, DGB, GXO, KC, IMT, VEU, SUM, HHT, LFF, UKQ, MWP, MUG, NOII, ZNI, ZSP, and 9NMI/5 attending. All were presented "3900 Club" certificates and are charter members. The picnic on Sunday, with an attendance of 250, was highlighted by many activities, including a meeting of all ARRL CD appointees. TKV and RRO are new ECs. FKA, now OPS, is the Mayor of Lindsay. SQI made WAS and WAC. NG, our RM, is trustee for the University High RC. He is busy building an 813 p.p. c.w. final. VIC's jr. operator took the Novice Class exam. UGJ now is an OPS. MXQ is the proud owner of a PE201. UGJ is going mobile. PQD wants to trade a tri-band for a

(Continued on page 84)

# THE HQ-140-X...

**KEEPS NOISE OUT!  
KEEPS SIGNALS IN!**

## THE HQ-140-X IN ACTION...

### CIVIL DEFENSE

Because of its dependability, the HQ-140-X is the receiver used by many local amateur groups for civil defense as well as other emergency use. Consider it as the communications receiver for your CD operations.

The noise limiter on the HQ-140-X communications receiver really works. It keeps noise down to a low level enabling you to pick up extremely weak signals. That's why the HQ-140-X is rated tops by the hundreds of hams who use it for difficult DX work.

Low noise level is just another of many reasons why Hams prefer the HQ-140-X. It's the amateur receiver built to professional standards. These professional standards include those little extras in design, circuitry and construction not normally found in an amateur receiver.

The extras show up in performance. In addition to a low noise level, the HQ-140-X receiver gives you:

**FREQUENCY STABILITY**—less than .01% frequency drift after warm-up anywhere from 540 Kc to 31 Mc.

**EXTREME SELECTIVITY**—sharp signal separation even in the most crowded bands.

**RUGGED CONSTRUCTION**—built to "Take It" for many years.

The HQ-140-X is available either as a cabinet model, or for rack-mounting. For complete details, write to The Hammarlund Manufacturing Co., Inc., 460 West 34th Street, New York 1, N. Y. Ask for Bulletin R-7.

# HAMMARLUND

SINCE 1910

2-meter Gonset converter. KSI, ex-K6AFW, is on 40, 20, and 15 meters looking for W6 buddies in Southern California. New mobiles in Lake Chabos include DOE, UGJ, GFA, and ZAK. ARG, ARH, and ARI are new KN5s. APH is rebuilding the rig to high power. BWZ is building a new ham shack. IIQ is a new ham at Hackberry. BMK hopes to have a new DX-100 on the air before long. The S. W. La. Emergency Net held a picnic hamfest the first part of June. ORS, OPS, EC, OO, and other appointments are open over the entire State. Drop a line to the SCM, RM, or PAM for details and applications. Thanks for the reports and keep them coming. Interest is rising in emergency communications and nets. Several good emergency nets are now in operation and a few more are getting started. Traffic: (Apr.) W5NDV 219, MXQ 149, EA 98, NG 86, SQI 18, UGJ 10, YDC 6. (Mar.) W5KRX 180, NG 133, NDV 49, SQI 6, VIC 6.

**MISSISSIPPI** — SCM, Julian G. Blakely, W5WZY. SEC: PFC. RM: WZ. PAM: JHS. MRN-NCS: IGW. The EC program still is under way and applications are being processed each day. A few of the active ECs are: W5OTD, VQE, EWE, KYC, IHP, LPG, DAT, VME, ZYO, ZNY, WZZ, YBH, KNA, AKM, GG, DT, RLP, NPO, JJA, ART, and FKS. The Mississippi Rebel Net has a few openings to give more complete coverage. Check in with IGW at 7 p.m. on 3785 kc. daily. The Interstate Net, with EWE as NCS, still is doing business, with 135 stations checking in this month. Congratulations to 9APY/5 on winning the section award for c.w. in the last Sweepstakes with 72,371 points. ONL/5 followed right behind with a score of 35,105. Both ran less than 100 watts. WZY claimed the section 'phone award with 14,000 points. EWE has joined the mobile ranks. WZ has a new transmitter on the air. RIM really clears the frequency with his kw. IGW is running high power, 400 watts complete break-in with a heterodyne VFO. Traffic: W51GW 197, EWE 145, VME 109, YFJ 105, JHS 50, EDE 48, WZY 36, KYC 24, RNB 23, RIM 15, YBH 11.

**TENNESSEE** — SCM, Harry C. Simpson, W4SCF — SEC: RRV. PAM: PFP. RM: WQW. PHQ announces that a Bull Throaters Award will be given to the Hillbilly Net member making the highest score in a 3-month period. The Bays Mountain Club is going strong. TYU received a GE Hurricane Citation. VNE received his DXCC, his third postwar DXCC (others were overseas stations). UWA sends a nice bulletin from the Cookeville ARC and reports the Upper Cumberland Net has been discontinued. SGU, WXL, ETJ, APD, UWA, BER, WIJ, ZJY, and BWQ had a Field Day dry run. PVD visited NJE and VJX. WOX and YRI have a new s.s.b. rig. WQT demonstrated a Sideband Slicer to the Clarksville Club. CVM worked 130 stations in the CD Contest before becoming ill, but WQT upheld the tradition by rolling up 69,750 points. After having been General Class only 60 days, K4ACG already had 20 countries. W8RUW/4 has shipped out to Germany. KFK and MSZ are going RTTY on 80 and 40 meters. RN5 Mgr. OGG reports 50 sessions with 12.5 QTC average. TDZ says the Chattanooga 10-meter Net is going nicely. UIQ is building a 75-meter mobile which will QSY the entire 'phone band from up front! UOA and DZW had an exhibit at the Science Fair at Vanderbilt. PRY has resigned as NCS of the Davidson County 10-meter Net. OEZ has announced DMU will be the replacement. The Humboldt ARC has received its ARRL charter of affiliation. CLS is president, IGW secretary. HQM and WCI are building 10-meter mobiles. Another new affiliate is the Watauga ARC, Johnson City, whose secretary, KN4ARZ, announces that club meetings are held the 2nd and 4th Mon. During the Memphis flash flood LVW and FRB used their boats for evacuation. BAQ, UDI, BCA, DCH, CRP, DIX, PKI, SCF, BAO, AFB, WTL, JU, and IQX assisted with traffic and reconnaissance. Six-meter activity is looking up, with HHK, 9FFF/4, FGG, NMM, YEL, BAQ, PJG, and VDW either on the air or in the process. His many friends will be sorry to hear of the death of BYN. Traffic: W4PL 1095, OGG 671, K4FEU 539, W4TYU 319, IIB 104, TZD 97, PFP 94, YMB 82, HIIH 63, WQW 63, SCF 59, VJ 41, SJ 33, CXY 25, IV 25, UOA 22, VNU 20, RRV 19, RMJ 16, BZQ 16, UVS 15, UVP 12, NDC 10, YPG 8, HUT 7, SON 5, TIE 5, YXA 5, DCH 4, LRO 2, TDZ 2, ARZ 1, CLQ 1, DMU 1, IGW 1, KFK 1, PVD 1, RHK 1, UIO 1, WOX 1, WQT 1, YRI 1.

## GREAT LAKES DIVISION

**KENTUCKY** — SCM, Robert E. Fields, W4SBI — SEC: CDA. RM: KKW. Acting PAM: NIZ. The newly-organized KPN (Kentucky 'Phone Net) shows the following statistics for the month of April: Average number stations per session, 19.833; average messages handled per session, 4; total number stations participating, 595; total messages cleared, 121; stations participating, 50 per cent or more, 13; 20 per cent or more, 23; 10 per cent or more, 34. Activity for March of the KYN (Kentucky C.W. Net) shows these figures: 75 sessions; traffic total 310, with an average of 4.01 per session; 48 active stations. ZDA and ZDB make up an OM-XYL team on the KYN as both are NCS. BAZ is working on plans to get Kentucky's first RACES net started with civil defense in Frankfort. JUI has been working 20 meter DX lately. WNIH is mobile on 80, 40, 20, 15, and 10 meters. According to JHU, the Logan County Novice Net has been changed to the Kentucky Novice Net (KYNN).

All Novices in Kentucky and surrounding states are cordially invited to participate. Stations which call into the net will be put on the roster and later sent a copy of the roster. The net time is 2 p.m. CST each Sun. on 3735 kc. Traffic: W4KKW 207, NIZ 128, SBI 112, ZDB 56, RPF 48, CDA 44, ZLK 43, QCD 42, SUD 40, ZDA 36, JHU 28, K4FAV 21, W4LXA 18, BAM 15, SZB 12, OMW 9, JUI 4, WBD 4.

**MICHIGAN** — SCM, Thomas G. Mitchell, W8RAE — Aast. SCMs: Bob Cooper, 8AQA (phone); Joe Beljan, 8SCW (c.w.). SEC: GJH. New appointees are AJJ as OPS and HFA as OES. Congrats to both. The Allegan V.H.F. Picnic date has been changed to Aug. 14th. Fewer stations reported traffic this month, but our total is about the same as for March. The biggest news for this report is that the Michigan ComPlan for RACES has just been approved by the FCC and FCDA. This plan has been in the works for five years and represents the efforts of our SEC and his associates over that period. Our thanks to them for the work to date, but the job of forming a working RACES organization requires the support of stations in this section. To all who have been waiting and wondering what we in Michigan are doing about our role in c.d., here is your chance to offer your services and become RACES licensed stations. Remember, in the event of an emergency, only RACES licensed stations will be allowed to operate. Register via AREC registration forms, which are available from this office or from any EC. As yet, the ComPlan has not been coordinated with the Michigan Office of Civil Defense (MOCD), but this work is in process and printed copies will be circulated through the AREC organization to all concerned. TBP and TIC both report EC activity continuing in the Muskegon Area. FX, still waging war on demon line noise, is longing for a rural QTH like HKT's. IUJ is back after his operation, as his traffic total indicates. AQA is the new vice-chairman of his AIEE section and is very QRL. PHM is going into MARS work and PHA regrets that he can't use his MARS traffic totals on the Form 1 reports. WXO has been QRT overhauling the rig and rebuilding the antenna that "went with the wind." NUL's new buffer stage puts him up in the 35-watt class and PDF is QRP because of loss of his final plate transformer. Traffic: (Apr.) W8NOH 320, PHA 243, NUL 173, SRK 165, ILP 152, IRO 119, IBB 93, DAP 87, ZLK 85, NTC 66, FX 65, WVL 65, DLZ 58, SJF 58, SWG 51, QIX 40, QXO 37, HSG 34, IUJ 33, RAE 30, IV 29, ZHB 21, AQA 14, PHM 14, PDF 12, SCW 9, HKT 8, MQG 8, INF 7, AUD 2. (Mar.) W8TBP 11, INF 7, WXO 7.

**OHIO** — SCM, John E. Siringer, W8AJW — Aast. SCMs: J. C. Erickson, 8DAE; W. B. Davis, 8JNF; and E. F. Bonnet, 8OVG. SEC: UPB. RMs: DAE and FYO. PAMs: EQN and HUX. JDN and JHH are new OPs. On Apr. 30th the OCARC met in Columbus. The Council will award both club and individual trophies in future ARRL DX Contests. Officers elected were HNP, chairman; GQ, vice-chairman; VHO, secy.; and AL, treas. DAE makes BPL for the third successive month, the fourth Ohio amateur to qualify for the BPL medallion. EQN, OCARC Contest Manager, reports the following scores in the Ohio Intrastate QSO Party: AJW-7295, JHH-4300, MEI-2210, JDN-2040, PJ-1564, TAQ-1218, VTP-936, EQN-561, MQQ-345, AL-336, HUX-320, BTW-288, LGY-272, JDC-240, RO-198, DAE-150, JSV-130, BEW-130, GHT-60, DCJ-42, FRD-40, YPP-16, THJ/M-12, CRA-9, IFX-4, EPB-1. The unofficial club winner was Foresta Jr. with 7643 points. We deeply regret the death of HIF, EC for Lucas County and Aast. C.D. Communications Officer to HNP in the Toledo Area. The Springfield Radio Club has become incorporated. On June 12th the Tusco group held a mobile roundup and summer hamfest at Dover Fairgrounds. Amateur Radio Week in Ohio, as proclaimed by Governor Lausche, is scheduled to include ARRL Field Day week end. The old-fashioned hamfest of the Findlay Radio Club will be held Sept. 11th. The Dog House Net elected PQQ, pres.; TJD, vice-pres.; CRS, secy.; and HUX, treas. On April 17th the Toledo Mobile group conducted a successful scrap drive to help defray the high costs of Field Day. New Novices in the Dover/New Philly Area are VXA, VTR, WFE, WFJ, and WMI. HNP was instructor in radio and communications at the Camp Perry C.D. meeting on May 14th. K8FAD is the call of the Wright-Patterson AFB Radio Club. GDQ, of 160-meter DX fame, was appointed Lorain Co. c.d. amateur radio operator. The Lorain Co. Amateur Radio Assn. elected LCE, pres.; OYN, vice-pres.; VMD, secy. Medals were awarded AJW and BF, CWA horseshoe-pitching champs, by JNF. The Intericity gang elected HTO, pres.; OZZ, vice-pres.; and QXD, secy. May QST reported HPP as having a romantic interest. This was a tremendous understatement as she has been elected queen and sweetheart of the Lockbourne AFB. The OVARA *Ether Waves* reports that a picnic is scheduled for June 12th. GCARA's Mike & Key informs us that twenty 10-w.p.m. code certificates have been issued to the present code class. According to its good bulletin *Key Klitz and Feed Back*, the Hooking Valley Radio Club is building up the club treasury by a project of raffling off fishing gear. Dayton's *RP Carrier* informs us that 6-meter activity is gaining in the area with HOH, INQ, and NEE leading the way. RCJ advises that PTS is in charge of a new code and theory class for the Lake-

Viking "Ranger" Transmitter/Exciter Kit complete with tubes and all necessary instructions, less crystals, key, and mike.

**\$214.50 Amateur Net**

Viking "Ranger" Transmitter/Exciter wired and tested including tubes, less crystals, key, and mike. . . . **\$293.00 Amateur Net**

For the complete story on the Viking "Ranger" write for Booklet 724 containing detailed information, and schematic diagram.

Here it is! The new, improved Viking "Ranger" with the perfect keying system. No more clicks and chirps even when driving a full kilowatt! Timed sequence keying provides ideal "make" and "break" on your keyed signal, yet VFO is keyed for fast break-in. Press the key and the VFO turns on quickly (before the keyed amplifier), and it stays on a fraction of a second after the amplifier cuts off. Wave shaping is then applied to the keyed amplifier stages for a perfect waveform. Time delay sequence is adjustable and may be set to operate so fast that a "breaking" signal can be heard between transmitted dots! Entirely electronic in operation, the system utilizes a type of grid block keying without relays and provides clean and crisp electronic keying.

Buy your Viking "Ranger" today! Truly the finest low power rig available, it packs enough power for enjoyable contacts all over the world. Later using the "Ranger" as an exciter you can add a Viking Kilowatt Power Amplifier and enjoy the ultimate in high power performance and convenience.

## E. F. JOHNSON COMPANY

THE  
NEW

# PRECISION MODEL 120

GIVES YOU WHAT YOU WANTED IN A  
**HIGH SENSITIVITY  
MULTI-RANGE TEST SET**

- ✓ MORE RANGES
- ✓ AN EXTRA-LOW RESISTANCE RANGE
- ✓ AN EXTRA-LOW VOLTAGE RANGE
- ✓ AN EXTENDED LOW CURRENT RANGE
- ✓ A LARGER METER SCALE FACE
- ✓ POSITIVE CONTACT JACKS and PLUGS

Compare These Wide Spread Ranges and Features:

- ★ 8 DC VOLTAGE RANGES: 20,000 ohms per volt.
- ★ 8 AC VOLTAGE RANGES: 5,000 ohms per volt.  
0-1.2-3-12-60-300-600-1200-6000 volts.
- ★ 8 AC OUTPUT RANGES: same as AC volt ranges.
- ★ 7 DC CURRENT RANGES:  
0-60-300  $\mu$ a. 0-1.2-12-120-600 Ma. 0-12 Amps.
- ★ 5 RESISTANCE RANGES: self-contained  
0-200-2000-200,000 ohms. 0-2-20-megohms.
- ★ 8 DECIBEL RANGES: -20 DB to +77DB.  
0 DB = 1 Milliwatt, 600 ohms.
- ★ EXTRA LARGE 5 1/4" RUGGED 'PAGE' METER:  
40 microamperes sensitivity, 2% accuracy.
- ★ 1% MULTIPLIERS and SHUNTS
- ★ TWO JACKS SERVE ALL STANDARD RANGES
- ★ "TRANSIT" SAFETY POSITION on range selector  
protects meter during transport and storage.
- ★ CUSTOM-MOLDED PHENOLIC CASE and PANEL

MODEL 120... complete with internal ohmmeter  
batteries, banana-plug test leads and detailed  
operating manual. Overall Case Dimensions  
5 3/8" x 7 x 3 1/8"

Net Price \$39.95

Geauga Club. Hamilton's *Feedline* states that OFL was chief speaker at the last meeting. The Club meets the 1st Fri. of each month at the YMCA. Springfield's Q-5 informs us that the annual banquet was a screaming success with Gen. Mgr. Budlong, Director Brabb, and UPB, the SEC, in attendance. This group meets at the local YMCA. Write DCJ for particulars. Toledo's *Shack Gossip* reports RZV passed his General Class exam; TTY moved from Perrysburg to Toledo and new Toledo Radio Club officers are BIQ, pres.; BN, vice-pres.; RZQ, rec. secy.; RBX, corr. secy.; and RZMI, treas. The Columbus *Carascope* relates that WAB, former CARA member, is prexy of the Tiffin Club; JUM has been working mobile from Harrisburg, Penna.; and TSE has gone mobile. Northeastern Ohio's *Ham Flashes* tells us that WHF, WJP, and WNR are Novices at Greenford School; CYN, of Garrettsville, recently passed away; CMS has made WAS on 6 meters; JW is the 75-meter 'phone DX man in the area; and ZFZ is Nile's standout DX man on 15 meters. The Ohio 'Phone Net meets at 5:00 P.M. EST, Mon. through Fri. on 3860 kc. HPP is NCS. The Ohio Council of Amateur Radio Clubs wants all clubs in the State, affiliated or not, on its mailing list. Send club name, officers' names, date of annual election and meeting night dates to HNP, council chairman. Traffic: (Apr.) W8FYQ 461, DAE 250, UPB 190, MVJ 151, ARO 98, IIR 78, AMH 56, MQQ 54, IFX 51, HNP 50, AJW 46, ZAU 44, RO 42, IJH 37, LZE 34, HPP 24, AJH 20, QXH 18, TLW 12, LMB 11, GZ 8, HUX 8, ET 7, MGC 6, QIE 5, BF 4, EQN 4, HFE 4, LGR 4, ABO 3, BLS 3, VTF 3, AYR 2, CRA 2, DG 2, MEI 2, KXN 1, VUS 1. (Mar.) W8MVJ 81, WAV 22, PBX 7, QXH 7, DL 1.

## HUDSON DIVISION

EASTERN NEW YORK — SCM, Stephen J. Neason, W2JLI — SEC, RTE, RMs: K2BJS and W2TYC. PAMs: GDD and IJG. The E.N.Y. Council of Radio Clubs is now in full operation. The first official meeting was held at the Nelson House in Pok on Apr. 16th and the following officers were elected: ILL, pres.; GTC, vice-pres.; K2DRV, treas.; and EFU, secy. Delegates from 60 per cent of the E.N.Y. clubs attended as well as many guests, including Director Cooke, OBU. Plans are under way which will be of much benefit to all of our member clubs. All interested clubs should write the Council secy. for information. EC WWK has recovered from a recent illness and reports that the Schenectady Co. AREC Net meets every Sun. at 1400 on 3950 kc. Section Net certificates were awarded to K2s DKM, DXP, BBJ, GOB, and EKE for activity on NY-SEPTN. K2EDH has a new beam on 14 Mc. plus a new wire for 3.5 Mc. Jon is an ORS and is very active. K2HVN is active on NYS (3925 kc.) and the Tuckahoe C.D. Congratulations to AARA on the publication of *B Plus*. The bulletin contains much useful information and news. K2BNI is the editor. Club officers are ONE, pres.; GPC, vice-pres.; KN2HQI, secy.; and K2CT, treas. RTE and ILL each received a citation awarded by the Edison Committee for activity during the hurricanes of last year. New officers of the HHRL are AAD, pres.; K2DRN, secy.; K2AYZ, treas.; and OIT, act. mgr. MHE is a proud papa for the fifth time. It's a girl. A good club member pays his dues and thus supports his club. Let's all keep our clubs alive and be good club members. New officers of the RVWARS are EYG, pres.; KJL, vice-pres.; BEC, secy.-treas. The Club is planning many interesting activities. Traffic: K2EDH 120, EHI 33, W2LRW 26, K2EKE 22, HJX 20, W2EFU 16, K2HVN 15, EUU 11, W2ANB 5, K2BE 2.

NEW YORK CITY AND LONG ISLAND — SCM, Carleton L. Coleman, W2YBT — Asst. SCM, Harry J. Dannels, 2TUK, SEC: ZAI. PAM: NJL. RMs: VNJ and LPJ. The new PAM replacing JZX is NJL. Vi had to relinquish the PAM post because she and the OM, JDG, are moving to New York City. VNJ is anxiously looking for business on NLT (3710 kc.), the section slow-speed training net. LPJ could use an NCS on 2RN for the Mon. and Thurs. late sessions. Most AREC and RACES nets were active for the April 30th drill. DSC, with operators JOA and K2s BJS and EOF, relayed from NYC 'phone nets to NYS c.w. nets with simultaneously-operated rigs. K2DDU is sporting a new NC-183. K2ECN's new 300-watter is doing a fine job. K2HYK has new Viking II and VFO. VDT built a new antenna tuner for his B&W 5100. LGK's jr. operator passed the Novice exam and is awaiting his call. IVS completed his "Ultimate" key. PF reports that the Radio Club of Brooklyn, founded in 1919, is the oldest amateur radio club in New York. Officers of the Club are PF, pres.; CCD, vice-pres.; BKP, secy.; AAZ, treas. AOD uses AX9903 finals on 144 and 435 Mc. MDM now has a 40-meter ground plane. K2GWW finished the new transmitter using a pair of 1625s. GXC has joined the 2-meter ranks. Ditto AEE for the first time in its 41-year history. LG, one of the Tu-Boro Club's charter members, now is on 10 meters. AZY is the latest addition to the Tu-Boro caravan. K2AED has completed a 2-meter converter. '55 officers of the Mid-Island RC are JBQ, pres.; KTF, vice-pres.; STG, secy.; and AZT, treas. K2KKZ dropped the "N." Ex-K2GSZ now is KP4ACI and is looking for NYC-LI friends on 10-, 15-, and sometimes 20-meter 'phone with his Ranger and 220-ft. Vee. KN2LDL has the rig set up in his office. WCR, the V.H.F.

# Introducing...

## the Eimac

# 4X250B

Radial-beam power tetrode

- **Higher Power**
- **Easier Cooling**
- **Longer Life**

ACTUAL SIZE

**4X250B**, a new, superior radial-beam power tetrode by Eimac — originators of the famous 4X150A—is now available. Unilaterally interchangeable with the 4X150A in practically all applications, this amazing new bantam for modulator, oscillator and amplifier application from low frequencies into UHF, offers these advantages:

**HIGHER POWER**—Electrical advances permit an increased plate dissipation rating of 250 watts, plate voltages to 2000 volts and doubled plate power input capabilities of 500 watts.

**EASIER COOLING**—Development of the Eimac integral-finned anode makes cooling so easy that only one-third the air-pressure and one-half the cubic feet of air are required. Forced air is unnecessary during standby periods.

**LONGER LIFE**—A newly designed, highly efficient oxide cathode and increased temperature tolerances, coupled with Eimac-developed production and testing techniques enable the 4X250B to meet the most critical standards. New tech-

niques in grid production, high vacuum outgassing and product evaluation are among the features that insure uniform incomparable quality and more hours of top performance.

The small, rugged, versatile 4X250B is now available for existing sockets or sockets of yet-to-be-designed equipment demanding optimum quality and performance.

### TYPICAL OPERATION

(per tube, frequencies to 175mc)

# ANNOUNCING!

## NEW LOW PRICES

For Most Models

### Mosley "VEST-POCKET" Rotary Beam Antennas

Here's happy news for Hams! NOW — just in time for the 'Beam Raising Season' — MOSLEY is glad to announce an appreciable reduction in Amateur net prices for most models of the popular "Vest Pocket" Rotary Beam Antennas!

MODEL VPA1015-2	2 El. 10, 11 or 15 Meter Beam. (formerly \$49.95)	NOW \$39.89
MODEL VPA1015-3	3 El. 10, 11 or 15 Meter Beam. (formerly \$69.95)	NOW \$59.68
MODEL VPA20-2	2 El. 20 Meter Beam. (formerly \$55.95)	NOW \$44.73
MODEL VPA20-3	3 El. 20 Meter Beam. (formerly \$79.95)	NOW \$66.37

Increased sales volume, permitting more advantageous raw material purchases and the use of more efficient production methods, make possible these new low prices. The practical, rugged designs and careful workmanship have won world-wide recognition for MOSLEY "V-P" Rotary Beam Antennas. These qualities — despite reduced prices — will be constantly improved!

Ask your favorite Ham Equipment Supplier or write direct for Free copy of MOSLEY Catalog H-55.

ST. LOUIS 14, MISSOURI

Institute station, soon will be heard on 220 Mc. K2GHS is spending a lot of time with the new HQ-140X. The Five Towns RC has elected the following officers: BFN, pres.; K2EWB, vice-pres.; K2CFF, secy.; and KRP, treas. KN2KRJ is working for WAS award. Another "ham" family is OM K2HZC. XYL KN2LUS, and jr. operator KN2LUR. K2JNE dropped the "N." RZB is back on 20 meters again. The Levittown RC has a new Communicator and an HQ-129X. JVO demonstrated his s.s.b. to the North Shore RC with a KH-6-Land contact. LR soon will be heard as DL4LR. New members of the NYRC are K2s HVM and JVB and KN2LYV. A new call at HJ is KN2LYC. GG added 4-400-A linear on 20-meter s.s.b. WFL has a new Viking Ranger. The Chaminade HS RC boasts more than 50 members. The Fieldston School Radio-Electronics Club uses an AT-1 and a BC-348N. The Humdinger Net, a training net, meets on 7220 kc. at noon with PEQ as NCS. 1RTV/2 now is K2MQV. YHP added 4 new states in the recent 2-meter opening. DBI is leaving for overseas. Traffic: (Apr.) W2LPJ 594, AEE 386, VNJ 331, JOA 280, MUM 110, OME 69, K2CRH 47, ABW 41, W2DSC 38, GPQ 34, K2HYK 30, W2GXC 23, VDT 20, K2GHS 18, W2LGK 18, K2AMP 14, DDU 13, W2IN 6, IVS 5, PF 5, TUK 4, K2CMV 3, W2EC 3. (Mar.) W2GXC 86, AEE 16, LGK 14, HJ 8, AZS 7, K2BAH 5, HYK 4, DVT 3, AED 1. (Feb.) W2MZX 4.

NORTHERN NEW JERSEY — SCM, Lloyd H. Manamon, W2VQR — SEC: IIN. PAM: CCS. RMs: NKD, CGG, and EAS. K2EUN is off the air because of antenna trouble. CXW completed his 740th QSO with G6BY. He has been keeping skeds with G6BY since November, 1950. K2EUN is leaving the section soon and will next be heard from W5-Land. KN2IVZ had his shack attacked by squirrels. Result one speaker cone and one output transformer are no longer with him. CCS needs more New Jersey 75-meter 'phone stations in TCPN, 3970 kc. daily from 1900 to 2000 hours EDST. How about some of you fellows lending a hand? It will be sincerely appreciated. VYB is out of the Navy and on the air again. CFB is busy lending a hand to prospective new hams. Harry asks that anyone in his area, which includes towns adjacent to Toms River as well, who is interested in getting started in amateur radio see him at any time for instruction. CVW soon will have a new QTH in Sayerville. KN2IVJ and KN2EVJ passed their General Class exams. WFK is about to move to Boston. The Irvington Radio Amateur Club Auxiliary reports great progress since its organization a few short months ago. All YLs and XYLs in the Irvington Area are invited to attend meetings. If interested, contact Debbie Klarfeld at Hillside, Tel. WA 6-4642. QLF has a brand-new XYL. Mr. & Mrs. have established their residence in Jersey City. Northern New Jersey Novices active on 80 meters are KN2s LRF, KJT, LSX, JIA, and JXL. KN2KHZ is quite the DX man and keeps the Globe Scout real busy these days. ZPD again is congratulated on his endless hours of work in the RACES program in Bloomfield. K2DHE temporarily is QRL. It looks now like the wedding bells will ring for him very soon. NIE is getting the antennas in his back yard all fixed up after a long winter's work. GUM and his new Ranger sound great on the air. It's good to have him back with us. K2ICE is going great on 144 Mc. with his two towers and his horizontal and vertical arrays. Traffic: (Apr.) W2EAS 234, CQB 196, K2EUN 127, GFX 84, DSW 74, W2FPM 47, K2BWQ 40, KN2IVZ 33, K2EQP 30, W2CXW 25, CCS 24, HXP 15, CFB 6, VYV 5, CJX 4, NIY 3, CVW 1. (Mar.) K2EUN 74.

### MIDWEST DIVISION

IOWA — SCM, William G. Davis, W0PP — By the time this report appears BDR will be your new SCM. Please give him the cooperation you have always given me. The officers of the Iowa 75 'Phone Net for the next year are BSG as NCS; DWD, KJH, ERP, and TTT as alternates; TTT, BDR, FLN, DWD, ERP, and FMX as directors. Officers of the newly-formed and incorporated Fairfield High School Amateur Radio Club are UEG, pres.; LPW, vice-pres.; WDC, secy.; and CPC, treas. and act. mgr. Two KNØ licenses and W0WDC have been acquired since the club was formed in January this year. WDC is a YL operator and very active. W0ZSI, a newcomer to Iowa, reports for the Davenport gang. The club station, 0BXE, is going strong on 75 meters since the weather has warmed up. HMM's classes still are going strong. CGY received a QSL saying he had the best fist on the air. He's only been at it 30 years. The number of mobiles in Cedar Rapids is astounding. BDR and SCA took the entire output of messages from K5USA over Easter, a total of 531, and made BPL in 48 hours. PKX has his Ranger debugged. LJW says the HQ was worth waiting for. LJW and his band are on WOC-TV every Mon. at 9:30 P.M. SEF has a new Viking Adventurer. KN0AAH has a new Globe Scout. New on TLCN: 8GXM/0. KVJ reports he was heard by QVA, 140 miles, with his antenna grounded. PAN handled communications for Boy Scout simulated emergency. SQE made the highest scoring Novice award in Iowa. Traffic: (Apr.) W0SCA 1801, BDR 1704, PZO 597, CZ 192, QVA 112, KJV 106, LJW 76, BLH 32, PAN 27, SQE 20, LFZ/0 16, NGS 7, FDM 6, HWU 4. (Mar.) W0PZO 464.

# MALLORY HAM BULLETIN

*To solve switch problems around the ham shack . . . in portable test equipment . . . in Civilian Defense gear . . .*

## USE MALLORY SERIES 3100-3200 ROTARY SELECTOR SWITCHES

It is probable that most amateurs are familiar with the operation of Mallory 3100-3200 series rotary selector switches when used in antenna changeover circuits of the type commonly employed in converters, signal boosters, and RF pre-amplifiers. However, it is doubtful that very many amateurs are fully aware of the extent to which these compact switches can be used around the ham shack to solve other switching problems.

In many respects, the Mallory 3100-3200 series switches offer more genuinely useful features to the amateur designer than any other switch, or family of switches, made. They are small and compact, which means they can be extremely useful in portable test equipment or Civilian Defense gear. Their axially positioned solder lugs reduce the over-all panel space required for mounting, and at the same time permit more convenient wiring.

In spite of their small size, the Mallory 3100-3200 switches do not sacrifice efficiency or reliability of operation. Each terminal-contact is fabricated from a single piece of metal to reduce circuit loss and the possibility of intermittents. At 6 volts DC, these contacts will carry 10 amperes of current without excessive heating. At 250 volts DC, 50 milliamperes may be made and broken continuously without harm to the switch. Triple X grade phenolic insulation, used throughout, assures excellent high frequency operating characteristics for coil and crystal switching in either transmitters or receivers.

The unique Mallory 3100-3200 switch design has been field-tested thousands of times as an important component in expensive commercial test equipment. Research laboratories use it daily as a part of precision measuring devices. And it is recommended consistently time after time in published plans detailing the construction of ordinary and highly specialized electronic apparatus.

Yet, the same switch is available to you from your regular Mallory Distributor at no extra cost.

For your information, the Mallory 3100-3200 switch is made in 12 circuit combinations, in either shorting or non-shorting styles. Switches of 12 positions or less (30° indexing) are 1 1/4" in diameter; all others are 1 1/16" in diameter, have up to 17 positions depending upon the number of circuits, and feature an adjustable stop mechanism. Bushings are standard 3/8" in diameter and have a #32 thread. Shafts are 1/4" x 2", and are pre-grooved at popular lengths to permit accurate cutting. An attractive molded knob is supplied with every switch.

Why not visit your Mallory Distributor today, and see these useful switches first hand? And while there, don't forget the other dependable Mallory parts you may need . . . controls, rheostats, potentiometers, pads, tubular capacitors, transmitting capacitors, dry electrolytics, disc rectifiers, vibrators, vibrator power supplies, and enamelled resistors.

# Modernize with **Triplet** meters

**A Size, Type, and Style  
for Every Installation**

Your instrumentation is strictly modern in design and construction with Triplet Meters. You can have sizes 2" to 7" in a wide variety of case shapes and mounting arrangements, A.C., D.C., R.F., Rectifier or Dynamometer. Molded and metal cases, rear illumination, and other special features are available. For precision and economy virtually every meter part is made in Triplet plants under rigid humidity and dust control. Every meter represents the refinements gained in half a century of meter experience. Keep your panels up-to-the-minute with Triplet Meters—famous the world over for quality, accuracy, and dependability.

# Triplet

TRIPLET ELECTRICAL INSTRUMENT COMPANY · BLUFFTON, OHIO, U.S.A.

KANSAS — SCM, Earl N. Johnston, W3ICV — SEC: PAH, RM: KKL/NYI, PAM: FNS. Hope to see you at some of the picnics this summer. The CKRC held its first Annual Award Banquet May 1st, giving out five awards. PSL took top honors as c.w. man, DUG as the outstanding 'phone man, MVG took the honors for v.h.f., the achievement award went to W0YGF, and the special merit award to JAS. The KVRC has held several surplus equipment auctions to raise expense money for Field Day. The Wheat Belt Radio Club has extensive plans for Field Day. The QTH, 11 miles north of Herndon, looks very promising. UOL is installing a Morrow converter and a Lyco in his car. ZCG and RGB are building 813 rigs with pi-network and adequate shielding for TVI. KN3ATA and KN3ATB, father and son, are new stations in Eldorado. KN3ADV also is a new station in Eldorado. News items are slim this month, but look at the traffic reports! Thanks, fellows, and would appreciate it if you would remind those you know handling traffic to report it. Traffic: (Apr.) W3BLI 677, N1Y 427, K0FDD 255, W0UAT 178, FEO 114, MXG 90, EOT 69, FNS 63, SQX 52, ABJ 48, ECD 48, FDJ 44, ICV 31, LOW 27, REP 26, LBJ 25, SAF 21, RKO 20, YXB 20, TNA 19, VFC 17, YJU 16, ECD 15, QGG 15, WNYVM 14, W3KAJ 13, YFE 11, UAU 10, DEL 8, LIX 8, WWR 8, LYF 7, W0WSEZ 7, KN3AHW 6, W0LQX 5, SVE 5, K0NAB 4, W0RJL 4, ZYL 3, W0CET/0 2, RKM 2, TTX 2, WNV 2, CLK 1. MISSOURI — SCM, James W. Hoover, W3GEP — SEC: VRF, PAM: BVL, RMs: OUD and QXO. The Show Me Net operates on 3580 kc. at 1600 on Sun. BUL, MFB, and ORF, net control stations for the Missouri Emergency Net, have received OPS appointments. K0AXY will be operating from his bed at St. Joseph's Hill Infirmary, Eureka, Mo. SUV has been elected chairman of the Transcontinental 'Phone Net for districts 9 and 0. CPI and SUV are the net control stations for these districts. RTR has been appointed EC for Rolla. The Suburban Radio Club, St. Louis, has received incorporation papers and has finished a new kilowatt transmitter. HJO is using a new electronic key. ECE has a new S-85 receiver. GCL is the Communications Officer of CAP at Rolla. RTW has a new 50-kc. frequency standard. OMP is going to Anchorage, Alaska, and his mother, OMM, will be operating on 20 meters more often. RUK is working on a new 100-watt transmitter. IJS is teaching a Novice code and theory class for a Boy Scout Troop. The St. Louis University Radio Club is getting a new 32V-3 transmitter. Traffic: (Apr.) W0CPI 1074, GAR 414, K3FBO 354, W0GBJ 352, BVL 194, CKQ 134, OMM 114, VTF 73, SAK 64, RTW 57, OUD 43, KIK 41, IIR 34, RUK 32, RCV 31, HUI 26, WAP 26, IJS 19, EBE 17, RTO 17, BUL 10, GEP 8, MFB 4, TCF 3, QMF 2. (Mar.) W0IJS 62, ECE 12, HJO 5. (Feb.) W3IJS 72.

NEBRASKA — SCM, Floyd B. Campbell, W0CBH — Asst. SCM: Tom Boydston, 0VYX, SEC: JDJ. The North Central Nebraska Amateurs recently organized the Elkhorn Valley Radio Club with RAM, pres.; PDH, treas.; RMO, secy. A new call at North Platte is UH with ex-EXP at the mike. LRK and KXD built a nice-looking (and working) 'scope. RHL still is plugging away on his Nebraska homebrewed kly. The Omaha boys were on the ball recently when a call came to provide communications for the practice evacuation of Omaha and vicinity. RNH has closed down for the summer. AIN built a VT keyer and Q multiplier. The Sidney and Potter boys recently received a nice write-up with a picture in the *Sidney Telegraph*. They were the only means of communication during a snow storm. The Wheat Belt Radio Club consists of members from Kansas and Nebraska. We sure need an EC from that part of Nebraska. Any takers? Employees of Union Pacific, don't forget to contact WR for your membership in the Union Pacific Radio Club. The North Platte Club has changed from Mon. to Tue. at 7:30 P.M. on 3950 kc. Traffic: W0ZJF 259, DDT 128, HTA 57, LJO 51, ETQ 45, KDW 41, RNH 40, AEM 39, FXH 32, MAO 23, VYX 23, ERM 22, ORW 22, DJU 20, PUT 19, KVM 13, FRs 12, FMW 11, NIK 10, ECQ 9, VGH 9, CHH 7, CBH 6, K0FBD 6, W0KFZ 6, OOX 6, BEA 5, AGP 4, IRW 4, RAM 4, THX 4, ZNI 4, BOQ 3, IAY 3, SZL 3, VRE 3, AIN 2, HQE 2, POL 2, UJI 2, PZH 1.

## NEW ENGLAND DIVISION

CONNECTICUT — SCM, Milton E. Chaffee, W1EFW — SEC: LKF, PAM: LWW, RM: KYQ, MCN and CN 3640 (0645 and 1845), CPN 3880 (1830), CTN 3640 (Sun. 0900), CTN 29,580 kc. The traffic total on CN hit a spring peak, with 249 in 26 sessions. KYQ and RGB were QNI 23 times, LIG 22, and YNC 20. On the early session, MCN fell back to 115 in 23 sessions, being plagued with rough conditions. YYM, RGB, and IBE took QNI honors. CTN reports reduced attendance. Aren't there any who want practice or is it an inconvenient time? We are interested in your comment. CKA, CLD, and ZFK report new General Class tickets. RAN is doing his stint for Uncle but managed activity during time off plus a new 6146 three-band portable job. YBH again is high on the traffic list — all on 'phone. BVB has forsaken 80 for 40 meters, where he finds QSOs more plentiful. TYQ is a regular on CN and MCN between flights to HZ-Land. WX reports much activity in the

## MOBILE RECEIVER

### Outstanding features

SIX BANDS . . . INCLUDING BROADCAST

- (1) 540-2000 KCS . . . . .
- (2) 3500-4000 KCS . . . . .
- (3) 7000-7300 KCS . . . . .
- (4) 14,000-14,350 KCS . . . . .
- (5) 21,000-21,450 KCS . . . . .
- (6) 28,000-29,700 KCS . . . . .

Individually calibrated amateur bands are spread across entire dial.

DOUBLE CONVERSION; 2050 KC 1st I.F. for high image rejection. 265 KC 2nd I.F. with 8 high Q tuned circuits. Provides sharp "skirt" selectivity. (3.5 KC at 6 db down.)

BEAT FREQUENCY OSCILLATOR: BFO with VR and panel adjustable pitch control. Highly stable for C.W. or SSB reception.

AUTOMATIC NOISE LIMITER . . . . .

ANTENNA TRIMMER . . . . .

PANEL MOUNTED "S" METER . . . . .

3 WATTS OF HIGH QUALITY OUTPUT AUDIO .

PHONE JACK . . . . .

TUBES: Eight tubes, plus OB-2 voltage regulator.

MECHANICAL: Front panel and chassis slip readily in and out of outer housing which may remain permanently mounted.

DIMENSIONS: 4 1/2" high, 6 1/2" wide, 9" deep. Power supply adds 4 3/4" to depth.

All the skill and experience of a firm universally recognized for their long-term leadership in the mobile field, have gone into this excellent new receiver. Here . . . finally, is a complete mobile receiver that squarely meets every mobile requirement . . . phone, C.W., SSB . . . without compromise . . . without detours. Excellent communication receiver performance is inherent . . . in mobile with both 6 and 12 volt systems . . . in home station operation with 115V AC.

UNIVERSAL  
POWER SUPPLY:

with BUILT-IN SPEAKER \*

6V DC . . 12V DC . . 115V AC

Matches receiver case, attaches and plugs into back of receiver as a cabinet extension. May also be separately mounted. Change from D.C. to A.C. made merely by using proper plugs which are supplied.

\* BUILT-IN SPEAKER: Terminals provided for external speaker, also for receiver muting.

**E. F. JOHNSON COMPANY**

292 Second Avenue Southwest

WASECA, MINNESOTA

Fairfield Area. New ORSs include UED and RRE. Other new appointments include DVO and ULY as ECs, while OPZ and RMT renewed EC appointments. EGS and EGN are new Novices in the Middletown Area, while Novice ELQ joined the ranks in Southington. EDH is the call of the Middlesex RA. RDV has moved to Windsor Locks. Several clubs report plans for Field Day so we can expect to see their scores mount up. NFG reports on Hamden c.d. and the need for further inspiration to maintain interest. DX was the speaker at the Apr. 21st meeting of the HCARA. Operators at TIJ for the Apr. 30th C.D. Test included STT, RGB, WHH, and PHP. Amateurs in south-east Connecticut soon will be mailing out novel QSL cards which picture the vacation attractions of their area. Any operator in the area will be able to obtain a supply of these cards from the Public Relations Department, Electric Boat Division, General Dynamics Corporation, Groton, Conn., by writing and asking for them. More news from the gang would be appreciated. Club secretaries, any news from your group? Nice bulletins are received from the MRA. How about others? Traffic: WICUJ 203, YBH 195, AW 176, KYQ 163, LIG 119, RB 98, LV 87, EFW 81, YYM 68, UED 67, RRE 64, BDI 53, ZDX 38, TYQ 26, HYP 24, BYB 18, RFJ 16, YNC 16, AYC 12, KV 12, RAN/2 11, CJD 10.

**MAINE**—The section's operators were saddened by the death of the SCM in April. The Sea Gull Net observed a period of silence on 3960 kc. during the funeral services. Activities reports are presented as compiled by the SEC. TVB, while an SCM election is in progress. LHA and BPI/VYA were nominated as SCM candidates. Nets: The Pine Tree Net meets Mon., Wed., and Fri. on 3596 kc. at 7 p.m. Barnyard Net Mon. through Sat. on 3960 kc. at 8 a.m.; State of Maine Phone Net Mon. through Sat. on 3940 kc. at 5 p.m.; the Maine c.d. drill Sun. on 3993 kc. at 11 a.m. and 3503.5 kc. at 9 a.m. BDF and BBS, Myron and Kay Hilton of Freeport, are on with new rig. Wel-come to two new Novices in Portland, Maynard Gray and his XYL. Good luck to the new Teen-age Forest Net, which meets Sat. and Sun. on 3900 kc. at 10 a.m. Teen-agers in the first call area are welcome. The State of Maine Phone Net is well supported. All will look for the Sea Gull Net when standard time rolls around again. VZI and her OM are planning a trip to Kokadjo for the season and taking along the emergency rig. SNE, AMR, and RSC are back from warmer climes. VWT, of Gray, is back home from overseas with a new rig on the way. Two meters is gaining headway in the State because of c.d. The many stations on 2 meters include DEO, AMR, ACO, BPI, LHA, GUV, LBJ, and ZBN. Maine lost two fine operators when Jim, YGO, and Hope, YGP, moved to W3-Land. PS now is on top of Mt. Washington in the WX service. We miss him on 29.5 Mc. We're indebted to PAM Happy Hamlin, WRZ, for a consolidated report on Sea Gull Net operation. From Sept. 27th to Apr. 22nd an average of 51 stations called in per night for 148 nights—223 different stations called in; 14 NCS with traffic total 593 messages. The highest number of call-ins was 80. Traffic: WIWVG 205, ZME 105, LKP 78, NXX 60, UDD 54, BX 37, LYR 32, ZMK 18, OTQ 13, ZUL 13, SQV 12, TWR 9, TKE 6, BDF 5, DNV 5.

**EASTERN MASSACHUSETTS**—SCM, Frank L. Baker, jr., WIALP—New appointments: BEI Medfield, WK Quincy, and WNP Concord as ECs; VYI and UKO as OPS. Appointments endorsed: WAG Taunton, AWO Wenham, FEC Middleboro, QGJ Woburn, YHY Fall River, AWA No. Reading, BWH Attleboro, LLY Arlington, ICU Amesbury, JSM Waltham, and VVZ E. Bridgewater as ECs; PXH and JSM as OES; QGJ, DJ and SS as OPS; PYM and SS as ORSs; TVZ and AYG as OOs; SCS and AWA as OBSs; AWA as PAM for the 6-meter band. New officers of the South Shore Radio Club are AJU, pres.; QMJ and QOI, vice-pres.; MME, secy.; TZQ, treas. Heard on 2 meters: QF mobile, RMF, EGY, DYQ, EMY, NAR, ZVS, and EPL. YVL is mobile on 10 meters. On 75 meters: ACC, SNZ, NWS, and LSA. ALP visited the Scituate Club. EQU is SNZ's boy. JLQ flew out to California on a trip. ALP and CTR visited the Framingham Club. Radio Amateur Open House had SX give a talk on s.s.b. Officers of the Nashoba Radio Club are WNP, pres.; TRD and ZML, vice-pres.; CAN, secy. WXC is getting out well on 10 meters. DWO is making an s.s.s.c. exciter. RCA and DJA are on 2 meters. New officers of the Braintree Radio Club are UIR, pres.; ZSU, vice-pres.; CTR, secy., treas. The Wellesley Radio Club had an auction. DUO, LOS, CLF, BW, KBS, AYG, ALP, CTR, EKG, and KWD were active in the April 30 RACES drill for Sector 1B. AMV and KXP have a sked with 0CQY. New hams in Easton: WNIs EGF, EGG, and DMQ. AAI and ZSR have General Class licenses. BB had 20 fixed, 1 mobile, and 7 mobiles ready in the Apr. 30th drill. CTR will be mobile soon. VYI operated as Region 1 FCDA on 75 meters in the Apr. 30th drill. WU has a new rig with 813s for 20 meters. The Cape Cod & Island Net has a new certificate designed by TWN/BLM. New Novices: EOJ, EQM, EPF, EVF. Tech. Class: EOZ. General Class: AEG, DLF, and DFY. New officers of the Norfolk County Radio Assn. are GDY, pres.; HTR, vice-pres.; ALK, secy.; CQN, treas. IIP is a new member. IXI is working on the house. WTF will have a new tower on the house. ALK is on 80 meters with 200 watts. WHC is

# JOIN THE LONG-LIFE FAMILY

When you rebuild, see how many of these Los Gatos favorites will fit your new circuitry. Or, use them when re-tubing.

You may be surprised, and you'll certainly be pleased with the additional nine-plus lives you'll get from these carefully-made electron tubes.

Ask for them at your jobber. If he doesn't have them, he can get them for you — overnight in most locations.

## Handy Centralab kit of miniatures

lets you make your own  
 steatite-insulated, rotary  
 selector switches

Just think of all you can do with this kit! It contains 30 miniature steatite sections, 12 complete index assemblies, and hardware. Everything is of deluxe, military quality. The whole works is packed in a four-drawer metal cabinet which you get without extra charge.

You can make miniature rotary switches that (1) are resistant to surface moisture, shock, vibration, (2) have excellent r.f. characteristics, low intercapacity, and 6-watt rating.

Have your Centralab distributor show you Centralab Kit No. 2000. Then buy one.

on 75 meters. A new club in Waltham is the Middlesex Amateur Radio Club. Officers are SAD, pres.; DYK, vice-pres.; AEG, secy.; ZPY, treas.; BTX/DED, chief eng.; DWH, act. mgr. The South Eastern Amateur RA will move into new quarters. Fifteen New Bedford hams have received an Edison Radio Amateur Award. AZU has a Match Box for his antenna farm. New Bedford's RACES frequency is 29,610 kc. for mobiles. WKM took part in the Apr. 30th drill with CCA/1 as Sector Hq. station at Fall River. CTZ is Radio Officer and WGN Alternate. The Wellesley Amateur Radio Society held a meeting with a talk by GWD of Raytheon. BEI will be on the air soon. In a Sector 1-B test drill the following were on: TYN, WUV, VPR, ISU, MME, FWS, CLF, ALP, YYZ, LOS, HSN, KWD, VAN, DUO, SH, FWS, GNK, YFA, and DW. ALP has a Viking VFO for his rig. The Lexington 2-meter C.D. Net is on 147.1 Mc. Sun. at 9 P.M. The Cape Cod & Island Emergency Net did a nice job during the snow storm in April. Traffic: (Apr.) WUOK 388, EMG 239, VYI 227, EPE 109, AVY 73, IBE 62, UE 49, NUP 44, LM 43, CLF 35, TY 23, WU 13, BY 10, DUO/TYN 9, BB 5, AHP 3, ZDX 2, A1P 1, CTR 1. (Mar.) W1VY 225, WU 9.

**WESTERN MASSACHUSETTS** — SCM, Osborne R. McKeraghan, WHIRV — SEC: RRX, RM: BVR, PAM: QWJ. The WM C.W. Net meets on 3560 kc. Mon. through Sat. at 1900 EDST. The Wm Phone Net meets on 3870 kc. Wed. at 1800 EDST under the guidance of MNG. The Central Mass. Amateur Radio Assn. has trained 34 Novice operators this year, many of them now General Class. The HCRA's annual banquet at Toto's was a huge success with 84 members, friends, and visitors enjoying a fine time. New ORSs are ZUU, YCG, and AJX. WCC made BPL in March with origins from the Springfield Technical High Science Fair. Tech High has six hams: WEF, ZIO, AJX, AOT, AOU, and DMT. AJX received the WANE award. RRX, TVJ, and NN1 received Edison Hurricane citations. UVI made up the maps accompanying the WM C.W. Net bulletin. TAY is drawing up the RACES plan for Amherst. LIB, Webster, reports himself, AJV, CJW, ABW, QEA, AVW, and WN1BHC signed up and operating a c.d. net. LRA is the new Westfield C.D. Radio Officer. TVJ reports 19,200 points in the CD Contest with an average of one QSO every 3.86 minutes. AEW transferred from Pittsfield to Holyoke. SPF reports his regular bulletin transmissions are looked for by many in the Worcester Area. The new EC for Fitchburg is STR. SRM received a WAV certificate from Vasteras Sweden Amateur Radio Club. KL7BHG, Fairbanks, Alaska, ex-WITAB, writes he is working W1s regularly on 14-Mc. c.w. and looking for more contacts. YCG made BPL with origins and deliveries from Amherst College. JYH has a new antenna and a 4/125A final. WN1ZWZ passed the General Class exam and has a new rig. Traffic: (Apr.) W1UKR 384, YCG 187, BYR 163, TVJ 151, AJX 133, WEF 128, HRV 86, MNG 63, TAY 46, RRX 41, DVW 34, AMI 28, ABY 23, ZUU 20, UVI 17, JYH 7, LIB 3, HRC 1. (Mar.) W1TAY 38.

**NEW HAMPSHIRE** — SCM, Harold J. Preble, WHHS — SEC: BCX, RM: CRW, PAM: AXL, CNX is the proud daddy of a new jr. operator named Scott born Apr. 14th. AVJ has a new granddaughter. The 1st Region RACES test held Apr. 30th went smoothly in New Hampshire but needs coverage in Carroll and Coos Counties. The Manchester Radio Club soon will be on the air with a new rig using a 4-250A on all bands. WUU has a new QTH in Manchester and expects to be back in net operation soon. TP is trying out the new SX-99. General Merrill is sponsoring the N. H. Dept. of P.W. and H. Radio Club, which meets every Thurs. evening 7 to 9 for code practice. ARK made BPL in April. RZD has a new position with the U. S. Dept. of Education in Washington and we hope to hear him on the air as a W3 soon. Welcome to Novices DYK, DZZ, ECA, and EBA. TNE now is K2KWN. Concord amateurs had an FB set-up at the recent Hobby Show in the N.G. Armory and handled considerable traffic. CRW has been reappointed RM, ORS, and OPS. CO3H3 wants New Hampshire contacts on 40-meter c.w. 5 to 6 a.m. ZLICH needs a New Hampshire contact for WAS. He is on 7002 kc. around midnight EST. We need more items from the eastern part of the State. Traffic: (Apr.) W1ARR 514, COC 45, ID 31, HOU 16, CCE 15, HS 14, PFU 14, FZ 9. (Mar.) W1CE 21.

**RHODE ISLAND** — SCM, Walter B. Hanson, jr., W1KKR — Almost the whole section had something to do with the April 30th combined RACES and AREC drill, and there's no doubt about it, gang, little Rhody did a grand job. The BVARC is almost ready for Field Day with 6 meters. DDD now has 400 watts and a new NC-125. IHV, ZEZ, AUT, and DPA discussed "Amateur Radio in Emergencies" on the Kiwanis Forum broadcast from station WWON. The Providence College Club has received the call DKG. K2LYE has been operating there. TRX is heard regularly on the Newport County Emergency Net and the R. I. Phone Net. 4CVO/1 reports nine off-frequency reports during the DX Contest. TBY has announced the formation of a new club in Bristol with URA sparking the deal. Seventeen members attended the organizational meeting, and the Club plans to affiliate with ARRL. Bristol County includes the towns of Bristol, Warren, and Barrington. New MARS affiliates include ZXA and AUT.

(Continued on page 96)

# System Engineered BY *Harvey*-WELLS

## T-90 BANDMASTER XMTR

The midget with a mighty punch — 90 watts CW — 75 watts phone — mobile or fixed. TVI suppressed — complete bandswitching — unmatched flexibility and versatility.  
Factory built and tested — with tubes.  
12 3/8" w x 10 1/2" d x 6 3/4" h. **\$179.50\***

## APS-90 A.C. POWER SUPPLY

Designed specifically for the T-90 Bandmaster transmitter for fixed station operation. Input: 115 VAC — Output: All necessary operating voltages for T-90 — complete with cables and plugs. Cabinet same size as T-90. **\$79.50\***

## R-9

## BANDMASTER RECEIVER

Physically identical to T-90 XMTR. 9 tubes — double conversion — wide bandspread. For mobile or fixed operation. Complete with tubes and built-in AC Power Supply. 6/12 volt power supply available. **\$149.50\***

## VPS-T-90 MOBILE POWER SUPPLY

A vibrator power supply for use with either 6 or 12 volt systems. Provides all necessary output voltages. Complete with 10 foot shielded multicordages. Complete with cable and connectors. Designed for easy installation and service. **\$89.50\***

## SPEAKERS

FS-1 Fixed Station Speaker **\$10.50**  
MS-1 Mobile Speaker **\$7.50**

## BANDMASTER "Z" MATCH

The finest antenna coupler ever offered — contains 4 instruments in one unit — Antenna Matching Unit; Forward-reflected Power Wattmeter; R.F. Wattmeter; Dummy Load. See description in May 1955 QST. Same physical size as T-90 and R-9. Will handle up to 500 watts input. **\$69.00\***

## TBS-50 BANDMASTER TRANSMITTER

A complete "ready to go XMTR" including crystal oscillator—vfo switching circuit. Phone or CW, 40 to 50 watts. 8 Bands — 80, 40, 20, 15, 11, 10, 6 & 2. 100% break-in operation. For mobile or fixed station use. Still "Best in its class". Sr. Model TBS-50C **\$111.50**

Deluxe Model TBS-50D **\$137.50**

## A COMPLETE MOBILE ANTENNA SYSTEM

### by VAARO-DAVIS

WITH THREE OUTSTANDING  
NEW ITEMS JUST ADDED:

#### ORIGINAL VARIABLE SINGLE UNIT COIL WITH NEW "DUAL CONTACT"

For 75-40-20-15-11 and 10 METER BANDS. NOW IN THE 1955 DESIGN with the NEW, IMPROVED "DUAL CONTACT" between the coil windings to provide a greater, more positive, more efficient contact. Coil can be INSTANTLY TUNED to ANY DESIRED BAND or FREQUENCY by ingenious locking device. Factory pretuned. Continuous coverage from 3750 kcs. to 30,000 kcs. Highest "Q" available in an all-band coil. Fits all whips and bases.

MODEL V-102B—for  
0 to 500 watts input  
**\$14.95**

MODEL V-103B—for  
0 to 1000 watts input  
**\$16.95**

#### VAARO—THE ORIGINAL "WHIP FLEXOR"

Since 75 meters and other low frequencies began, a new problem has arisen. Any change of antenna (voltage portion) in relation to car body, changes loading and therefore changes output tremendously.

This problem has been overcome by the "WHIP FLEXOR" which serves a dual purpose . . . It is designed to keep the whip perpendicular at extremely high speeds while allowing the whip to be brought down in a horizontal plane for garage storage, etc. This elimination of a base section spring prevents bad "QSB" action on the receiver end. . . .

Standard Model V110-S **\$1.95**  
De Luxe Heavy Duty  
Model V110-D **\$3.95**

#### VAARO "WHIP CLAMP"

ANOTHER VAARO FIRST! The Vaaro "Whip Clamp" securely fastens to the roof water drain of any make car without damage to the paint or metal. Allows the whip to be fastened down to car roof level for garage storage, heavy low wooded areas, etc., etc. Brass construction. Chrome plated.

MODEL V-109 Price: **\$1.79**

Write for Catalog Information and Name of Nearest Amateur Jobber

**DAVIS ELECTRONICS**  
**VAARO ELECTRONICS DIVISION**

4002 West Burbank Blvd. Burbank, California

ZXA boned for final exams with the prospect of an HQ-140X as a reward. VXC reports increased activity on the R. I. Intercity Net on 29.260 Mc. at 7:30 p.m. Traffic: W1BXN 116, BTW 98, VXC 85, UTA 80, TRX 62, TGD 52, ZXA 17, W4CVO/1 12, W1BIS 4.

VERMONT—SCM, Robert L. Scott, WIRNA—VTPN meets on 3860 kc. Sun. at 0930-1030 only; VTN on 3520 kc. week nights; GMN on 3860 kc. week days at 1200-1300 hours; Vt. c.d. nets Sun. at 1000 hours on 3993 and 3501.5 kc. ZWP, the Putney School Amateur Radio Club, Putney School, Putney, Vt., advises the Club has 12 members as follows: W1Ns DPE, DQN, DPD, DRY, DLE; W1s YAY and ARU; K2GRB. They operate mostly on week ends on 220 and 144 Mc., also 75- and 40-meter 'phone and c.w. Week-day operating is done at 0740-0820, 1320-1400, 1600-0820 (??), and 1900-2200. This is done between the dates of Sept. 10th and June 10th, the school year. The license plates seem to be bottled up in the committee to which it was first referred. Traffic: W1OAK 105, AVP 80, RNA 63, BJP 43, IT 39, VVP 27.

#### NORTHWESTERN DIVISION

ALASKA—SCM, Dave A. Fulton, KL7AGU—There seems to be an increase of mobile activity with the coming of longer days and the summer months. The Anchorage mobile gang hangs out on 3866 kc. and is planning a lot of interesting mobile activities for the summer months. AWB will be leaving soon for W5-Land; after working real hard on the Alaskan DX certificate Joe now is going to W-Land to try and earn one for himself. That is one for the book; work real hard to design a certificate and then move so you can qualify for it. DX seems to be improving in KL7-Land. Are we really over the worst of the sunspot cycle or is it our imagination? AMS is the proud owner of a new mobile receiver. ANG is back on the air mobile after a long silence. RE should be on soon sporting a new all-band vertical and a Globe King.

IDAHO—SCM, Alan K. Ross, W71WU—Shelley: ACD is on 50.1 and 50.4 Mc. with 500 watts and a four-element beam and needs only Montana and Utah for WAS on 6 meters. Caldwell: EYR reports most of his time is spent on 20 meters trying for DX. Gifford: VWS is busy working the gang with his Adventurer and had 106 QSOs for April. He is planning to go to college in Arkansas. Kellogg: RQG is plagued with power-line noise. At this writing he and FL, of Sand Point, are running the GEM Net. Emmett: TYG plans to teach school in Wilder this fall. Boise: BNU from Whitefish, Mont., trailer-parked in town for three weeks. NVO is active in the FARM Net and MARS-Army. New stations on the 145.44-Mc. net are WN7YUX, WN7YXK, and KHM. There are about 12 stations on this frequency around here now. More reports from you fellows would be appreciated. We don't know what you're doing if you don't tell us. Traffic: W7RQG 26, TYG 22, NVO 3, EYR 2.

MONTANA—SCM, Leslie E. Crouter, W7CT—MQI has been appointed Emergency Coordinator for the Billings Area. MQI's station is located in his store where he can monitor the net frequencies throughout the days and evenings, Mon. through Sat. UZN will be operating mobile from Silver Gate during the summer months. YHS is a new call on the air, operating both fixed and mobile rigs. YXQ, another new licensee, is an engineer at KBMY. Ted is busy winding chokes and power transformers for a kw. rig. VZN, who is purchasing agent for the American Chrome Mining Co. at Nye, also is a new licensee and operates mobile. OQI, the Billings Club, is reconditioning the Club's emergency generators and gear, anticipating more and better activity in the very near future. IWW is in the process of installing a new rig in the new Cadillac. The SEC, KUH, recently visited the Billings gang. MQI is delving into the mysteries of the galaxies with the aid of his recently-acquired telescope, a present from the XYL. KGJ, KGF, and YZQ have also been "star gazing" in Carl's back yard. Activities have not been too well reported. How about sending them in, fellows? Traffic: W7MQI 11.

OREGON—SCM, Edward F. Conyngham, W7ESJ—PQJ, in doing OO work, has noted many Novice stations on second and third harmonics, outside the bands. VJT reports that the McMinnville Amateur Radio Club set up a portable at a Rotary Club meeting to display message-handling during an emergency. The EC, SYB, described the operation, while THV and VTT handled some traffic. The operation was a success and did a good job of convincing the Rotarians of the value of amateur radio. APF still is able to make BPL, although battling TVI. PRA has the big rig down for repairs and is using the small 75-watter. THX put up a new bantam beam on 40 meters and his first call raised Ireland. As of May 1st the total League membership for Oregon was 614; attendance at the OARA Convention was over 700. Most of the League members were there. Northwestern Director CPY gave an interesting talk on League affairs. K6BJ gave a timely talk on tetraodes as Class B linears. Wes R. Schum gave a very interesting talk and practical demonstration of s.s.b. K1DR gave a talk and demonstration of vacuum-tube construction. Lt. Col. Schauers, sixth Army MARS director, gave an interesting talk on MARS. Lt. Paul McAfee covered electronics in

## 1 KW BALUNS

Husky B&W 1 KW baluns fill the gap between unbalanced feed lines and balanced antenna loads by accurately matching low impedance unbalanced transmitter outputs to rotary beam or folded dipole antennas. These baluns provide maximum transfer of power, low line radiation on transmission, and high signal-to-noise ratio on reception.

## COAXIAL SWITCHES

Model 550 permits instant selection of any one of five 52 or 75 ohm lines. Model 551 is a 2-pole, 2-position type used for switching various devices in or out of series connection with coax lines.

ALL OF THESE FINE B&W products are available at leading distributors' everywhere.

## SINGLE SIDEBAND GENERATOR

The 51SB generator offers sparkling SSB performance with your present B&W, Collins, or Johnson transmitter, on 80 through 10 meters with the output frequency control presently in your transmitter.

## DIP METER

This indispensable instrument serves as a sensitive grid dip meter, signal generator, absorption wave meter, or signal monitor from 1.75 to 260 mc. Saves time in transmitter tuning, neutralizing, antenna loading, etc. Colorcoded 5 band dial matches five coils supplied.

## AUDIO PHASE SHIFT NETWORK

Model 2Q4 splits any audio signal from 300 to 3000 cps into two equal amplitude components  $90^\circ \pm 1.5^\circ$  out of phase with respect to each other . . . for SSB operation.

## PLUG-IN LINKS

Match present feed lines up to 600 ohms by pulling out one coil, plugging in another with correct number of turns. Wide range of sizes and turns available.

## TYPE T INDUCTORS

Popular inductors for most amateur applications up to 500 watts. Plug-in links for matching load impedances from 72 to 600 ohms.

**Barker & Williamson, Inc.**

237 Fairfield Ave., Upper Darby, Pa.

## STANDARD DUALS and TRIPLES AT LESS COST

An IRC Q Control, one or more IRC Multisections, and you can assemble your own standard dual, triple, or even quadruple control—in just a few minutes and at rock-bottom cost.

### IRC MULTISECTIONS

Offer an endless variety of duals, triples, quadruples.

Assemble quickly and easily—attach like switches.

Provide an inexpensive way to make L and T Pads.

Available in 22 resistance values.

Your IRC Distributor has low-cost  
IRC Multisections.

### PACIFIC DIVISION

**HAWAII** — SCM, Samuel H. Lewbel, KH6AED — This was a busy month for your SCM. Our RACES application was approved by the FCC. AFQ is now the Deputy Radio Officer for the Hawaii County C.D., ABF for Maui County, and ABI for the Oahu C.D. The Kauai appointment still is to be made. In each case your SCM is appointing those who are ECs. The following appointments are being made: BHH, EC for the Windward Oahu Club; KC, EC for the Honolulu Mobile Club; and ANR, EC for the Leeward Oahu Amateur Radio Club. AUJ is now an OBS. She transmits Official Bulletins on 7150 kc. Mon., Wed., and Fri. at 1700Z. The license plate bill passed both houses of the legislature and was signed May 5th by Acting Governor Turner. Get in touch with your local civil defense office for application blanks. Traffic: KH6AJE 2299, KA2MA 904.

**NEVADA** — SCM, Ray T. Warner, W7JU — SEC: WVO, ECs: PEW, PRM, TVE, TJY, and ZT. OPSs: JUO and UPS. ORSs: MIV, PEW, and VIU. OBS: BVZ. Nevada State Frequencies: Phone - 3880 and 7268 kc.; c.w., 3660 and 7110. UPS will be operating portable for the next few months at Wendover, on the Utah-Nevada state line. WN7ZKD is a new Novice in Elko. It looks like the 7th call area soon will blossom out with "K" call prefixes. The Southern Nevada Amateur Radio Club is furnishing mobiles for the Las Vegas "Heldorado" parade control. A booth has been provided in "Heldorado" Village where a ham station will be placed in operation. 1N3M, our National Emergency Coordinator, spent a restless week in Las Vegas awaiting the recent atomic blast which pulverized "Doom City." 9KJM now is ZHT in Las Vegas. ARRL appointees are reminded to send in monthly activity reports by the 1st of each month.

**SANTA CLARA VALLEY** — SCM, R. Paul Tibbs, W6WGO — Another correction in the listing of club officers for the NPEC as sent in by MMG: the vice-president should read KN6EWG. A new call in South San Francisco is KN6KOJ. Eddie is the son of QIE. ZXS is finishing a new heterodyne exciter. We have received *Dits and Daks*, the paper of the Camp Gordon Radio Club, Camp Gordon, Ga. The editor of the paper is none other than 6OIF. AIT is going higher power with a new final. Irv needs more power to do better in traffic nets. K6BBI's CD score for c.w. was 47,800. Dick's MARS call is AAF6BBD. EXX has a new 144-Mc. converter using 417 in cascade all set for Field Day and also will use 6 meters. K6BAM needs West Virginia and some W1 states for his WAS. NX's new 75A-4 sure cuts out QRM, according to Frank's story. Next comes a vertical all-band antenna, then watch the tree leaves get burned by r.f. around his QTH. FON is very busy keeping us informed about the latest on the license plate bill. ACN puts information out on several of the nets. In listen-

# ADD HIGH FIDELITY TO YOUR HOBBY

## *for all the family TO ENJOY*

### On-the-air or Off-the-air...

This natural extension of your hobby provides a new source of pleasure for your entire family. And with the "know-how" you already have, it is easy to put together a true high-fidelity system that gives thrilling, lifelike music reproduction. Just as E-V microphones and other equipment are widely used in amateur and commercial communications...so have E-V high-fidelity reproducing components and systems achieved high recognition for their outstanding quality. Shown here are a few typical examples.

**The Aristocrat.** Folded-horn corner enclosure. Designed for E-V or any full-range 12-in. speaker or E-V separate 2-way or 3-way systems. Unusually smooth reproduction down to 35 cps. Selected mahogany veneers. Size: 29-5/8 in. high, 19 in. wide, 16-5/16 in. deep.

Mahogany Net: \$66.00  
Korina Blonde. Net: \$72.00

**Model A20C Circutotron Amplifier.** Has all necessary inputs and controls for handling a complete high-fidelity system. Power output 20 watts rated, 40 watts on peaks. Frequency response  $\pm 1$  db 20-20,000 cps at full 20 watts. Size: 10 3/4 in. wide, 11 3/4 in. deep, 7 3/8 in. high. Net: \$110.00

**Model 12TRXB Triaxial Speaker.** Integrated 3-way speaker system combines E-V T35B Super Sonax, Radax Propagator, and large bass cone with heavy magnet in one compact, concentric assembly. Response 35-15,000 cps in recommended Aristocrat enclosure. With level control for VHF driver. Net: \$59.70

**Model 84 Ultra-Linear Ceramic Cartridge.** Flat response  $\pm 2 1/2$  db from 20 to 15,000 cps. No preamplifier required. No inductive hum pick-up. No microphonics. High-level output. For microgroove 33 1/3 and 45 rpm.

**Model 84D.** With Diamond Stylus. Net: \$23.10  
**Model 84S.** With Sapphire Stylus. Net: \$ 9.60

## the new PANADAPTOR MODEL PR-1

the eyes of your  
modern receiver

The new smart-looking PR-1 has sufficient compensation available to provide wide-view Panoramic reception with modern receivers featuring high selectivity. Operates with receivers having an IF of 450 kc-470 kc or 500 kc.

The PR-1 offers visual monitoring over a band of frequencies up to 200 kc, lets you "see" everything from the other fellow's frequencies in three-way or round robin QSO's to replies to your CQ's. You see it all on a 3-inch CR Tube which also simplifies frequency setting and station monitoring, facilitates network operations, assists in making adjustments of transmitters and antenna, enables identification and interpretation of transmitter signal characteristics (your own and others), selects QRM-free spots for sending and listening.

**Features • Visual displays up to 200 kc. wide • 3-inch Cathode Ray Tube • Phone output for use of PR-1 as a second unisignal aural receiver • Cathode Ray Tube connection for use as external 'scope.**

**ONLY \$199.75 Net**

**When ordering specify model  
of your receiver and I.F.**

## NEO-TECH PRODUCTS, INC.

14 So. Second Ave. • Mount Vernon, N. Y.  
Mount Vernon 4-3970

ing on frequencies of some of the c.w. nets we find that RN-6 seems to be lacking for NCS. Several times no directed net sessions have been heard. What's the matter, boys? Come on, you code artists, let's give the nets some help. Volunteer for duty once a week. Traffic: K6BBD 170, W6FON 84, UTV 62, K6BAM 48, W6AIT 26, EXX 6.

**EAST BAY** — SCM, Guy Black, W6RLB — Asst. SCMs: Oliver Nelson, 6MXQ, for v.h.f.; and Harry Cameron, 6RVC, for TVI. SEC: WGM. RMs: JOH, EFD, and IPW. ECs: K6GK, K6ERR, W6CAN, FLT, ZZP, and QDE. PAM: LL. Your Acting SCM spent ten days at Camp Mercury, Nev., during April participating in the atomic bomb test "Operation Cue." This was a test of civil defense, and the State of California provided a 20-man communication team as a service function. Among the members of this team, besides RLB, were JN, ASL, CFS, LY, CV, OU, and WYT. There were lots of other hams there besides. K6ERR is the newest OO appointee. The Oakland Radio Club is to be congratulated on its first old-timers' night. EY's remaining was one of the high points of the evening. Prexy EDJ deserves great credit for the way he has been sparking the ORC for the past two years. YDI is one of the most faithful reporters among the OPS gang. Unfortunately Bland does not get much traffic over the Mission Trail for Martinez. One of the newest hams to have an official appointment, K6EPC is already a hot traffic man and is working DX besides. VSV and UOV keep referring to this monthly write-up as the "wasted space column," but they seem to have read everything in it. Who is kidding whom? At Travis AFB the traffic load for April was carried entirely by 3AMZ. ZRH is supervising a radar team near Washington, D. C., and reports meeting VSW and DXJ back East. Bob's CTH is 9581 TU, Sig. Corps Eng. Lab. Flid., Sta. No. 4, Fort Meade, Md. ZVV, in Berkeley, is a new AREC member. K6GK is full of ideas on how to organize traffic and sends in a new batch nearly every month. HBF soon will be active on 20 meters. All RTTY men should consider joining the MARS RTTY Net at 7:00 p.m. PDT Wed. on 3275 kc. A6VPC is net controller. See Buck for more details. Traffic: K6WAY 789, F6G 115, GK 103, W6HBF 40, K6EPC 38, W6ITH 20, EJA 12, YDI 2.

**SAN FRANCISCO** — SCM, Walter A. Buckley, W6GCC — Asst. SCM: William T. Nakahara, 6GHL. KEV, staff member of the Product Engineering Group of Eitel-McCullough, gave a talk and demonstration entitled "Effect of Varying Currents and Voltages in Beam Tetrodes." A kw. final using 4 x 150 tubes with final and power supply fully mounted and in actual operation into a dummy load was used. The Club also enjoyed listening to a talk by IBUD about the ARRL from its start to the present. The 6-meter net now has an official name, christened so by the HAMS. Hereafter it will be called the HI 50 Net locally. BDJ came in first in the April 29ers Club hidden transmitter hunt. BIP and SY trailed in second. KN6HTC, Sonoma County Radio Club secy., reports that AJF will be guest speaker at the next meeting. The Club enjoyed an hour of movies, compliments of the telephone company. BZT, stationed at Hamilton Air Force Base, requested membership in the AREC. SLX has joined the Naval Reserve Electronics Unit. Two more of the boys in the Humboldt section hope to receive tickets soon. The S. F. Naval Shipyard Club and HAMS (Red Cross Club) are making plans to edge out UW on Field Day. Having already won twice UW would get to retain the plaque permanently if they come out on top for the third round. The recent YLRC/SF drive for new members brought in ten applications from the ladies in the surrounding vicinity. KZF is busy packing cars for his new hobby of miniature railroading. He has a beautiful set-up sharing room with the ham gear. K6CQE is getting good results via 10 meters on his new 10-meter beam. GTY did himself and the local amateurs the honor of winning the National Company's contest for receiver suggestions. The prize was a complete \$1000 ham shack. JZ's board meeting at the University of Calif. brought in many local club representatives. K6GPX passed the electronic test and now is working for S.P. at Shasta, Calif. He joined the Mission Trail Net so he still could contact the boys via the net. 7TJY visited San Francisco on company business and some of the local boys joined him for dinner and a ragchew. AF6JWF and AF6GGC met many of the net members at MARS activities at the McClellan Air Force Base dinner May 23rd. PHH collected prizes for the MTN Roundup. RBQ's XYL reports that Bill is improving in health and hopes to be allowed visitors soon. SWP received the Edison Radio Award Certificate of Merit for emergency service during the 1954 hurricanes. Pat reports that he needs only Delaware to complete his WAS. YC says that LU3HR is planning a visit to San Francisco and hopes to attend club meetings here. QMO entered his first CD Party on 'phone and made 29 contacts in 14 sections. GQA says OO work was slow in April. CTH spent two weeks in the hospital with a ruptured appendix. GHI celebrated his 25th wedding anniversary with a nice dinner party. RUR and 2CDT are operating an R/C boat on Speckles Lake on 27.225 Mc. ZLQ, CDT, and RUR hope to go 6-meter mobile soon. Traffic: W6SWP 597, GQY 292, QMO 296, GQZ 50, GQA 2.

**SACRAMENTO VALLEY** — SCM, Harold L. Lucero, W6JDN — As soon as K4AQQ receives his W6 call he will

(Continued on page 102)

*"Worked 87 foreign countries, all continents and 40 zones"* with a Gotham Antenna and 35 watts.

## READ THIS AMAZING LETTER: How an inexpensive **FULL SIZE** Gotham Rotary Beam made it possible to "work the world!"

Florida, 13 May 1955

Gentlemen:

I'd like to express my enthusiasm and satisfaction regarding your 20-meter rotary beam antenna. I purchased one of your standard two-element units in February of this year. Prior to this time I had been using a collinear array about one wavelength above ground. The transmitter feeding this antenna had a power output of about 35 watts, and results were quite discouraging.

When my Gotham arrived, it was easily assembled in a couple hours. The same transmitter was used to excite the Gotham antenna, using the same power as before. Results have been quite gratifying, and it is interesting to note that in the three months since using the Gotham antenna, I have worked 87 foreign countries, all continents, and 40 zones.

I am able to keep schedule with amateur radio —\* in the Cape Verde Islands every week. *It was impossible to even hear this station before using the Gotham beam.*

Extremely high winds are prevalent in this part of Florida. The Gotham beam has withstood blows in excess of 50 miles an hour without failure.

I have enthusiastically recommended Gotham to all the hams who ask what type I am using (and most of them do, when I tell them the amount of power I'm using). I wish you every success with your product, and feel that it is well worth the modest price.

(name and call letters upon request)\*

### EVERY FULL-SIZE GOTHAM ROTARY BEAM IS ENGINEERED FOR SIMPLICITY, STRENGTH, PERFORMANCE

Your Gotham comes to you completely fabricated, made (except for the polystyrene insulator) entirely of new, rustless, first-quality mill stock aluminum. You'll find no link coupling, no complicated mounts, no tuning stubs. You get

good, solid tubing and not flimsy wire. Easy assembly, simple and quick matching of line to antenna. Yet Gotham's price is 25% to 75% lower than the midget beams which Gotham so easily out-performs.

**MAIL THIS COUPON TODAY!**  
**10-DAY MONEY BACK GUARANTEE**

See sample beams and literature at these Gotham distributors!

#### HOW TO ORDER:

### ROANOKE DIVISION

NORTH CAROLINA—SCM, Charles H. Brydges, W4WXX—SEC: ZG. PAM: ONM. RM: VHH. AGI is permanently on 40-80-meter c.w.-'phone. AKQ will operate the station most of time except during the summer months when YZC and YE from Virginia will be at the helm. AGI will be active in CD Parties as an ORS. KN4AV has a new S-86 receiver and is on 40 and 80 meters. FOU is back in Blowing Rock and is working on MARS gear. ZYC was elected NCS of the Tarheel Net for the month of May. YPY is getting good results with DX on 20 meters with his Globe Scout at 40 watts. A very nice picnic was held at KN4BVQ's cabin on the Catawba River, with members of the Charlotte Amateur Radio Club attending. BDU, VHH, and WXZ were active in the C.W. CD Party. HVK is mobile in the Charlotte Area. The Confederate Teen-age Net on 3900 kc. is going very well. You older fellows are invited to check in. BUA is building a 36-tube receiver. SOD has a Viking Kilowatt and has applied for OBS appointment. HKB reported in the Virginia Phone Net to help with disaster traffic out of Bowling Green, where the big forest fire had caused much destruction. WXZ also relayed. I have received a few letters from interested people about the traffic net to be held on Saturdays. If interested, please drop me a line so plans can be made soon. EQJ needs only South Dakota for her WAS award. The OM, EJP, has 43. AH has some TV antennas above his 120-foot high 20-meter beam, and receives 8 channels, not to mention all the DX. If you want convenient monthly report cards to send in to the SCM, just send your call and address on a post card and they will be mailed right out to you. Traffic: W4WXX 208, YPY 28, AGI 2, EJP 2.

SOUTH CAROLINA—SCM, T. Hunter Wood, W4ANK—The Florence Club was host to Ed Tilton, V.H.F. Editor of QST on May 6th. TSU is building a new kw. rig and is now working 20 meters. FM reports that maintaining batteries for his emergency rig did not prove practical so he converted it to a portable rig that will operate from a car battery in a pinch. LXX reports that he recently became a member of the OTC. FGX is on 40-meter c.w. looking for South Dakota and Idaho for WAS and placed 3rd for South Carolina in the SS Contest using 40 watts

(Continued on page 104)

# New! FO-1 PRINTED CIRCUIT OSCILLATOR

For Generating Spot Frequency Signals  
with Guaranteed Tolerance

1000 KC to 15,000 KC

Since the operating tolerance of a crystal is greatly affected by the associated operating circuit, the use of the FO-1 Oscillator in conjunction with the FX-1 Crystal will guarantee close tolerance operation. Tolerances as close as .001 percent can be obtained.

## USES

### AMATEUR

- Net Operation
- Frequency Standards
- Close band-edge operation

### COMMERCIAL

- Frequency Standards
- Signal Generators for alignment purposes
- Oscillators in new equipment

FO-1	—Oscillator Kit (less tube and crystal).....	\$3.95
FO-1A	—Oscillator, factory wired and tested with tube (less crystal) .....	\$6.95

# FX-1 CRYSTAL

Companion to the FO-1 Oscillator

The FX-1 Crystal is designed for use only with the FO-1 Oscillator. For tolerances of .01% and .005%, any FX-1 Crystal can be used with any FO-1 Oscillator.

For tolerances closer than .005% the oscillator and crystal must be purchased together. The oscillator is factory wired, and the crystal custom calibrated for the specific oscillator.

FX-1

Tolerance	1000-1499 KC	1500-1999 KC	2000-9999 KC	10,000-15,000 KC
FX-1 .01%	\$5.25	\$3.75	\$2.50	\$3.25
FX-1 .005%	\$6.00	\$4.50	\$3.00	\$4.30
(.0025% and .001% tolerances are available only by purchasing the FO-1 Oscillator and Crystal together)				
FX-1 .0025%	\$6.75*	\$5.25*	\$3.75*	\$4.75*
FX-1 .001%	\$8.00*	\$6.50*	\$5.00*	\$6.00*

\*Prices are for crystal only. To insure this tolerance crystal must be purchased with oscillator factory wired and tested. For total price add \$6.95 to price of crystal desired.

**HOW TO ORDER:** In order to give the fastest possible service, crystals and oscillators are sold direct. Where cash accompanies the order, International will prepay the postage; otherwise, shipment will be made C. O. D.

International CRYSTAL Mfg. Co., Inc. 18 N. Lee Phone FO 5-1165 OKLAHOMA CITY, OKLA.

## Ham mobile power supply

JAMES Model  
C-1050 Vibrator  
Power Supply complete with vibrators, fuses, rectifiers.

Wired and Tested.....Amateur, Net.....\$49.95  
Kit Form .....Amateur, Net.....\$39.95

The FIRST MOBILE POWER SUPPLY designed by amateurs for amateur equipment...incorporating these unique features:

- 6 or 12 volt operation through simple tap changes
- Transmitter power up to 500 volts at 200 MA with simultaneous low voltage power
- Receiver power
- Transmitter/receiver crossover relay and complete installation instructions

Here is a unit that will fully power and control commercially built mobile transmitters and receivers or your own designed rig.

Buy a JAMES Power Supply to professionalize/simplify your mobile installation.

*John G. Kennedy*

VIBRAPOWR COMPANY

4036 N. Rockwell St. • Chicago 18, Ill.

AUL is building a 500-watt rig. K4AIB reports from the Greenville Club that members are adding 2-meter rigs and looking for a new club room. K4AQQ/h, formerly of Myrtle Beach, now is located in Susanville, Calif. The following have qualified for SC C.W. Net certificates: AKC, ANK, CHD, KYN, RPV, YAA, FML K4AQQ, and W9JBN/4. If you have qualified and did not get the certificate, contact W4AKC. The SC C.W. Net has closed down for the summer but members are requested to get together on 3795 kc. for rag chews during the off season. Traffic: (Apr.) W4HDR 217, Z1Z 140, ANK 12, FM 3. (Mar.) W4HDR 237, TSU 16.

**VIRGINIA** — SCM, John Carl Morgan, W4KX — SEC: RTV. Your SCM had nice visits with the Richmond ARC and the Rappahannock Valley ARC and now is a member of the latter. Club activity is at an all-time high. The Blue Ridge ARC (Roanoke) threw a nice hamfest. BYZ reports a new club has been formed in Danville. PXA sends a roster of the Southwest Va. ARC, representing Wythe, Montgomery, and Pulaski Counties, and having 100 per cent AREC members. The VFN picnic is scheduled this year at HQN's antenna farm in Bumpass, NV, host heretofore, is QRL with the Tidewater Area gang's preparations for the Division Convention at Old Point. Summer doldrums and QRN are hitting the nets. VSN and VN have curtailed until fall. VFN continues 7 nights a week. PXA, VN mgr., wants volunteers from among the newer hams for summer NCS tricks. BLR took traffic honors in April. Kay made BPL in the process! PCF's total took a dive because operator 3QQE was QRL rifle range. Don, of K4MC, had his overseas orders cancelled and now is getting 3WDP/4 fired up. BLR took high c.w. honors, and HLF high combined c.w./phone in the YL/OM Contest. JUJ got a WANE certificate. CIT and DQI combined for the exhibit station at the Arlington Science Fair. SPE, MCL, WJJ, JFV, and UGO are sidebanding. AAD is completing the kw. rig and planning s.s.b. AJJ reports KN4ASI was drafted. LW and YKB are QRL Navy cruises. K4ASU is turning in good traffic totals and meeting all Virginia nets. A QSL was received from KFC as the anniversary of the last exchange 20 years ago when we were 6KFC/3KU. He wants to repeat in 1975! YZC reports he, pappy YE, and kid brother KN4CAX will summer in North Carolina operating as AGI. Traffic: W4BLR 695, K4ASU 105, W4AMZ 46, TVO 42, YKB 32, K4MC 28, W4AAD 13, AJJ 12, IA 9, RGZ 7, BYZ 5, IF 3, CGE 2, LW 2.

**WEST VIRGINIA** — SCM, Albert H. Hix, W8PQQ — SEC: YPR. PAMs: FGL and GCZ. RMs: DFC, GBF, HZA, and JWX. BWK is quite active now, as is PZT. The Princeton Club held a big picnic June 5th. GCZ started a code class last fall for seven boys; five now have their Novice tickets. Congratulations, fellows. Let's hear from you. A new Novice in So. Charlestown is WN8WHQ. Welcome to the fold. SHG is plugging away at WAS. CHP is doing a good job with the Globe King. NYH has new Match Box and Coax Ratiometer and is well pleased with them. PZT has a Wheatstone tape punch and keyer which sure sounds good. JWX has a new Johnson rig and is doing a bang-up efficient traffic job. GCN is on s.s.b. and has a very good signal. SNP is getting along very well with his bug. The Tri-City Club meets the 1st Fri. of each month at the Naval Reserve Armory, South Charleston. All are cordially invited to attend. CLZ has a new Johnson KW. He installed a key-click filter in the Ranger which sounds very good. Traffic: W8GBF 139, JWX 126, GEP 87, HZA 87, PZT 70, BWK 35, DFC 16, UYR 16, NYH 6, KDQ 4, PQQ 4.

## ROCKY MOUNTAIN DIVISION

**UTAH** — SCM, Floyd L. Hinshaw, W7UTM — GPN, in support of the ARC of Ogden, conducted another simulated disaster test Apr. 15th. Emergency power was used with communications being carried on 75 and 2 meters. JPN now is all set up and waiting for openings on 6 meters. Hal also advises the local activity on 2 meters is improving. RQT and the Ogden Club held another hidden transmitter hunt with FB eats after. The June V.H.F. Party will find QDJ and his Davis High pals atop a nearby mountain in an effort to increase the DX possibilities. NIB is busy fabricating a new steel tower and waiting for the new fishing season to open. SP has rebuilt and overhauled his 6-meter gear and will be on hand when the openings come. Traffic: W7JPN 12, UTM 6.

**WYOMING** — SCM, Wallace J. Ritter, W7PKX — Pony Express Net members handled all National Guard communications during the recent National "Minute-Man" alert in professional manner, thanks to the organizing of MWS and the excellent cooperation of all who participated, those who helped clear frequencies, etc. Congratulations, fellows, on a job well done. The Sheridan Radio Club had a display and station JMN in operation during the annual Arts and Crafts Exhibit with some traffic handled. HDS, with the help of NCS PAV, is collecting weather reports on the morning session of P. E. Net for the U. S. Weather Bureau at Cheyenne. PAW is doing lots of mobile work while commuting to and from work. Because of the work of LRU and PMA (EC), the Sheridan Club now has ground allotted by the County for a club house and start of a c.d. emergency

(Continued on page 106)

# NOW... First Complete Line Of Shortened Antennas

## The New -- 15, 20 and 40 Meter

Now, for the first time, the amateur can select from a FULL line of professionally engineered short antennas. All aluminum construction, with coils enclosed in weatherproof bakelite containers with coil assembly #12 formvar wire. Will handle 1 KW. 52 ohm match. Turns with a T.V. rotor.

### 20 Meter, 2 Element Shortbeam

communications center. The "YO" Net, on 3610 kc., is going fine with approximately 15 regular check-ins, and would like to see more of the Pony Express gang QNI c.w. Traffic: W7PKX 280, HDS 128, PAV 25, MNW 17, VXX 12, 11 L 7.

## SOUTHEASTERN DIVISION

**ALABAMA** — SCM, Joe A. Shannon, W4MI — SEC: TKL, RM: KIX, PAM: RNK. The section has lost a most active member in George, chief operator at K4FDY and a mainstay on AENP, who has been transferred. Montgomery's new local emergency net, AENK, is doing an excellent job with HY1 as manager, averaging twenty call-ins each Sun. at 1300 on 3940 kc. ZSQ is warming up to c.w. and has plans for a battery-powered emergency rig. RNK reports that his 30K is in good shape again. VYI has moved into the new home and has the "power house" going strong again. KN4BJY has the DX fever and says the gang at St. Bernard includes GUR, BFT, WN4FTO, WN4HFZ, KN4BJY, and KN4ASJ. K4AOZ jacked up the antenna another 25 feet, installed baluns, and is laying down a good signal with the Viking 1. K4APF, the XYL of K4AOZ, is a new member of the Southern Belles Net. GET and OLG are new Asst. ECs in Birmingham, and EBD reports that AENR had a total of 134 call-ins during April. Reports on April activity were received from three Novices. Let's have more cou on the doings of our newcomers. Traffic: W4COU 1131, K4FDY 1038, W4UHA 513, HKK 107, WOG 107, KIX 92, EJZ 81, ZSQ 49, TKL 37, CEF 35, ZSH 25, RLG 20, HY1 19, RNK 14, ZWE 10, CAH 9, TXO 8, USM 2, VYI 2, KN4AJG 1, BJY 1.

**EASTERN FLORIDA** — SCM, John W. Hollister, jr., W4FWZ — The numerous letters I receive tell a remarkable story of ambitious amateurs wanting to get things done for ham radio. Emergency preparedness is certainly the watchword. Special praise goes to our work horses, the Emergency Coordinators. Gainesville: The GAS (100 per cent AREC, too) mobileers held their first simulated drill on 29 Mc. and EC WEM reports perfect county coverage. TJU, mgr. of TPTN, issued the first net bulletin, *The Unmodulated Carrier*, and opines, "A traffic net is a series of breaking stations interrupted by messages." Key West: ELS is using 'phone patch. So long to ZUS, who will be a VO3 on a.m., c.w., and s.s.b. LaBelle: HDU is using a Viking Ranger. Lake City: YNM says the USNR station is K4NCS. Lakeland: UMI reports hams will hold a series of open-house balls for the public. Melbourne: BWR reports increased AREC membership. Miami: IYT reports the Assistant EC for Coral Gables is IQF. The town is providing complete facilities for the AREC/DEN at the police station. PBS says the DEN was called out for the FNG alert/mobilization. PBS and IQF called a surprise DEN drill. IYT and PBS report that Radio WAHR (LUS, prop.) carries "Calling CQ" each Sat. a.m. for a half hour. Your SCM would like to have comments from anyone hearing this program. PBS is remodeling the shack. St. Petersburg: Convention? It was the best. Tampa: New club officers are LAW, YDI, ALP, and YFI. Jacksonville and Miami were enthusiastic about the visit of Ed Tilton. Jacksonville will set up an Armed Forces station again. The RACES plan has been approved for Orange, Dade, and Sarasota Counties. Traffic: (Apr.) W4PUJ 513, TJU 221, ELS 148, BWR 109, YJE 74, WS 70, LAP 68, K4ANW 42, W4WEO 42, ZIR 37, IYT 29, IM 27, SVB 23, FSS 17, BZI 16, LMT 15, PBS 10, KN4AAA 8, W4RWM 8, DES 7, HDU 6, WEM 6, FWZ 5, EHW 4. (Mar.) W4LMT 47, RWM 21, EHW 1.

**WESTERN FLORIDA** — SCM, Edward J. Collins, W4MS/RE — SEC: PLE, ECs: MFY and HIZ, K4AKP makes BPL, the second month in a row. GMS is looking over s.s.b. gear. BGG wants mobile gear for the Ford. AXP is reworking the main power supply that failed during LO Nite. We regret to report the passing of UCY's mother. CCY wants more and more power. DAO, RZV, PQW, ZUN, HJA, BZX, TTM, UUF, and MUX all meet the gang on the Pensacola Party Line each Sun. a.m. UUF keeps the 144-Mc. DX under control. QK meets the Hurricane Net and enjoys late-hour QSOs. KN4CLJ is keeping the air hot with his Adventurer. KN4CLK is another newcomer in Pensy. KN4IBK is gathering the QSLs. PAA wants new tower and beam. MS wants a 51SB to go with the 5100. ZPN and VR are the 7-Mc. c.w. men. JP'D keeps 7-Mc. 'phone hot. KN4AEP has antenna troubles. FHQ keeps an ear on the bands. HQG is planning a get-together with UUF. EAR wants to increase power. Traffic: (Apr.) K4AKP 1091. (Mar.) K4AKP 786.

**GEORGIA** — SCM, George W. Parker, W4NS — SEC: OPE, PAMs: ACH and LXK, RMs: MTS and OCG. Nets: The Georgia Cracker Emergency Net meets on 3995 kc. Sun. at 0830, Tue. and Thurs. at 1900. The Georgia State Net (GSN) meets on 3590 kc. Mon. through Fri. at 1900. BWD now is on 40-meter c.w. with an ARC-5. DDY is going great guns on 80 meters and has made BPL for two months now. KN4BXD is a new Novice in Quitman. HYV now is Radio Officer of the Atlanta Metropolitan Area C.D. YUM now is active on 15 meters. YWP has a new HQ-140 and has rigs ready to go on 6 and 2 meters. KN4CZR is the XYL of CFJ. New appointments: DWE as EC for Hart and

### Transitron "500" Linear Amplifier

Power Output:  
Single side-  
band 400 watts

peak envelope. C.W.—350W. An "honest to goodness" power-laden linear amplifier that comes right out of the design facilities of Transitron, Inc. So easy to operate, the Transitron "500" is a compact, fully shielded unit, ideally suited for single side-band operation. It has no plug-in coils and features a minimum number of tuning adjustments. Field tests have proven the "500" to be of low harmonic output, free from parasitics, and with excellent stability on all bands. Continuous tuning from 3.5 to 30MC. Driving power required: 5 watts.

Net Price .....\$369.50

Transitron  
T-R Switch

Immediate, automatic change-over from receiver to transmitter without coils, variable capacitors, or tuning adjustments. The Transitron Model TR-1000 Transmitter-Receiver (T-R) Switch is the most practical and efficient answer to operation of amateur and commercial transmitters and receivers from a common antenna. Its peak power handling capacity of 1000W. completely eliminates the difficulties encountered with heavy-duty antenna change-over relays. Over its operating range of 1.7 thru 32 megacycles, the insertion loss to the receiver never exceeds one S-Unit, while the power absorbed during transmission is negligible compared to the transmitter output.

Net Price .....\$9.95

Dlghy 9-4714

Arrow Hempstead - 215 Front Street  
IVanhoe 1-1826

Elbert Counties, KGD as EC for Lumpkin and White Counties. The Georgia Cracker Club will hold its annual meeting and picnic at Lake Blackshire, near Cordele, on Sun., Aug. 21st. Nine new Novices are awaiting their calls after completing the course offered by the Atlanta Radio Club. ZD, MTS, and KOR, the licensing committee, and instructors have announced the formation of a new series of classes for Novice and General Class. Thanks for the nice crop of reports this month. WKY now is mobile. CVY is getting the bugs out of his new mobile rig. PYR has a new Elnac receiver and transmitter. Let's have a little news along with those reports, fellows. Traffic: W4OCG 151, DDU 143, PIM 105, CEJ 82, YWP 79, ZDP 55, DJW 45, HYV 35, ZUF 29, ZD 26, NS 24, BWD 22, ZWT 20, MTS 16, HYW 8, YTO 8, YUM 7, BXV 4.

**WEST INDIES** — SCM, William Werner, KP4DJ — WR is new Aquadilla District EC. QR is on with a new Viking II, Matchbox, Windom antenna, and HQ-140 receiver. WT reports to the Weather Net on 3865 kc. daily at 7 A.M. and 5:30 P.M., plus the AREC Net on Wed. at 8 P.M. on 3925 kc. ABD and NY have new Globe King 500 transmitters. CO's emergency battery-powered transmitter is a Collins TCS9 working off 12 volts. QR's ground consists of a h.c. station's 120-wire radial system. UT has both a 12-volt and 110-volt power supply for new PMR6 receiver. DV is using an Elnac mobile rig to drive the kw. final at the home station. TZ transferred to Fort Sheridan. WR uses a Windom antenna on 80 and a folded dipole on 20 meters. WV burned out the power transformer in the receiver. PZ uses three-wire folded dipole with 640-ohm line on 75 meters. VA, the College of A.&M. station, uses a pair of 813s and speech clipping. PZ is building a speech clipper. AZ and JE are using vacuum-tube keying. RL has a Viking I. DJ is using half-wave 600-ohm line for 80-meter operation. NCSs of the 3559-ke. Net will look for answers from Novice stations on 3700/3750 kc. ABA is building an 813 transmitter. ABI is using a pair of 807s. ABD and ZC built 20-meter beams. RA is using a 40-meter antenna on 80 with an antenna tuner. RM bought a Mon-Key. ABA received a QSL for the first DL QSO on 3.7 Mc. CS joined the AREC. AAC was the section's high scorer in the SS. The PRARC has formed a ladies' auxiliary. Traffic: KP4WT 45, ZW 38, DV 2.

**CANAL ZONE** — SCM, Roger M. Howe, KZ5RM — KZ5FL, HK3AA, KZ5NM, and HC1CB did a fine job on some emergency traffic and probably saved a man's life by getting an iron lung from the Canal Zone to Bogota, Colombia, in a very short time on Apr. 24th. Also FL is keeping the civil defense sked with W4YB while DG is on her vacation Stateside. DG and GD were hosts for the radio club party at their home recently. Kurt Carlsen, W2ZXM/mm, was in Canal waters recently but did not get a chance to come ashore. EP, a charter member of the "washer gang," now has a 10-over-15-over-20 array. JD, DG, GD, JF, EP, RM, KA, PL, and PP are among those reported to be on vacation Stateside. Vice-President AE is doing a good job of running the CZARA while Prexy JD is on leave. BE checks into the traffic exchange on 7165 kc. daily at 1930 EST. Traffic: KZ5WA 70, CF 40, DG 22, BE 21, KA 13.

## SOUTHWESTERN DIVISION

**LOS ANGELES** — SCM, W. J. Schuch, W6CMN — SEC: QJW. RMs: GJP and BHG. We regret to report the passing of Horace Bodine, LJU. The Two Meter and Down Club will miss him very much. The Hamilton High School Radio Club has a new Viking Ranger. New officers are QXH, pres.; QIB, secy.; and K6JLY, parliamentarian. The Club also has a new all-band ground-plane antenna. K6LYF has joined the Mission Trail Net. PZN has 600 watts to an 806. K6COP has a new Q multiplier and S-meter on his NC-88. QJW reports the section leads the nation in activity under AREC/RACES for any section with 1428 AREC members, including 487 RACES authorizations. BEQ raised his 7-Mc. antenna and the wind immediately lowered it for him. AM is installing his fifth final. HIF is back at work after a long illness. Good luck, Walt. K6KMIJ has a new Viking II. RW now has 242 countries worked with 232 confirmed. MBW has a new 818 rig and is active on SCN and TCRN. KN6HOV now is on 40- and 15-meter c.w. with 75 watts. BUK has a new Dodge and is QRL installing mobile. USY skeds KA2USA on 14 Mc. The Pacifico Radio Club had a party and guests were UID, K6GHP, EEO, CEO, and BFC. ZDO has a clean bill of health from the TVI Committee on his 50-Mc. rig. CMN is polishing up fish hooks for his vacation in June and July. KN6HPZ has a Johnson Adventurer rig and has worked about 20 states so far. QWN finished basic training and moved on to Denver Armament School. K6DIK is active on 6 meters. QVS has a new s.s.b. exciter. K6DQA now has 10-meter mobile in the car. KL7NXI now is W6KWS. Traffic: (Apr.) W6GYH 313, K6EJT 289, W6USY 276, CMN 211, WPF 208, MBW 158, BHG 154, K6DQA 144, W6MLZ 108, CAK 96, GJP 65, HIF 54, KN6JUN 41, K6BWD 40, COP 37, EA 33, W6ORS 27, YVJ 21, KN6HOV 18, W6TDO 15, CK 14, EYII 12, K6LYF 7, W6AM 6, PZN 6, CBO 5, NTN 3, BEQ 2, K6ELX 2, (Mar.) # THE ANSWER TO A HAM'S DREAM!

## E-Z WAY TOWERS CRANK UP AND DOWN— TILT OVER

Be one of the first in your area with an E-Z Way Rotary Beam Tower. Simple to install, easy to adjust antennas. One of the sturdiest, most versatile towers in the industry. No guy wires required.

**SPECIFICATIONS:** All steel construction. Electric arc welded. Continuous diagonal bracing on two sides and climbable ladder-type horizontal bracing of  $\frac{3}{8}$ " rod on third side. 1038 extra hard steel  $7\frac{1}{2}$ "  $\Delta$  has legs of  $\frac{1}{2}$ " rod, diagonals  $\frac{1}{4}$ " rod.  $9\frac{1}{2}$ "  $\Delta$  legs  $\frac{1}{2}$ " structural pipe, diagonals  $\frac{1}{4}$ " rod.  $11\frac{1}{4}$ "  $\Delta$ —Legs  $\frac{3}{4}$ " structural pipe, diagonals  $5/16$ " rod. Rotor mounting plate drilled for Vee DX VB Rotor.

- GIN POLE mounting is 20'
- galvanized structural iron
- pipe with double hinged
- base and crank, pulley,
- cable to crank to perpendicular position. V bracket
- lacks tower.

Phone CHerry 1880

633 WALNUT STREET • CINCINNATI 2, OHIO

Huddleston, 6DLN. SEC: VFT. ECs: BAO, BZC, DLN, IIFQ, H1L, IIR1, IBS, KSL, KUU, and WYA. RM: ELQ. The annual Upper Ten Picnic will be held on July 10th at Glenn County Park near Cardiff. The usual good time is assured. IZG again is handling traffic after a switch in QT11 to National City. BAM, an old-time DX and traffic man, is checking into the SCN when work permits. K6DBG, W6OZO, PEJ, TGB, KN6IBY, and GPG provided ship-to-shore communications for the Orange County Outboard Club, with help from K6BEC, fixed, and FBF, mobile, in San Diego. New officers of the Coronado Club are K6AZW, pres.; K6BCG, vice-pres.; EDG, secy. VJT, president of the Upper Ten Club, has resigned because he was called to duty. K6BPK is offering code and theory classes to interested YLs and XYLs. The Palomar Radio Club had a fine program with IAB, at Camp Pendleton, for Armed Forces Day. The Orange County gang continues to have one of the finest mobile groups in the State. SYA and his wife vacationed to Florida with their new house trailer. The c.d. drill held by members of the Gillespie Amateur Radio Club was an outstanding success. Operating was done under conditions not expected for that time of the year, with rain, hail, snow, and extremely high winds. The entire group provided excellent communications and the results were beyond all expectations. With summer here all points toward camping, fishing, and that long-awaited vacation. Happy traveling to all, but please keep me posted so our column will continue to have more than just a heading to it. Traffic: W6IAB 3159, YDK 453, IZG 231, K6DBG 34, W6KVB 30, BAM 1.

**SANTA BARBARA**—SCM, William B. Farwell, W6QIW—Greetings from your new SCM and thanks for your support. New appointments: W6REF/6 as RM, K6ATX as OES, K6IPF as OBS. 3RNY is the new operator of K6CST at Point Mugu. AGO was appointed Act. Mgr. of the Paso Robles Club. TOP is back in Chicago for special training. MSW is the proud papa of a YL harmonic. CMR won a scholarship award. FYW says all he gets is more cats. Hi. K6CJ, Santa Maria; K6BOU, San Louis; and W6JFP, Guadalupe, are new stations on 2 meters. DX hounds take note: KN6IRM passed the Tech. Class exam. That buzz you hear from GH is not his rig, but a bee hive in the wall of his shack. The Santa Barbara Radio Club was 35 years old in May. Congrats! MWA now sports a half-gallon rig. IGH is installing all-band mobile in the new car. The new section c.w. net (SBN) meets Mon., Wed., and Fri. at 1845 DST on 3600 kc. K6NBI tops in traffic again. Traffic: K6NBI 279, W6REF/6 132, QIW 20, YCF 14, FYW 3.

### WEST GULF DIVISION

**NORTHERN TEXAS**—SCM, T. Bruce Craig, W5JQD —SEC: RRM. PAMs: PAK and IWQ. RMs: PCN and QH1. OXO is ex-4AYG, formerly an SCM. BPT reports KN5ADI is a new Novice in Palestine. The Abilene Amateur Radio Club elected ANL, pres.; VFP, vice-pres.; DEG, secy.-treas. The North Texas C.W. Net handled 169 pieces of traffic in 16 sessions. The DARC is active in civil defense planning. ZTG has a new 4-125A rig on the air now. HKF reports the Terry County Radio Club is making contacts on emergency power. The Odessa Amateur Radio Club sponsored a successful hamfest recently. NW acted as MC at the barbecue luncheon served by the famed Chuck Wagon gang. AFR reports on the East Texas Amateur Radio Club's annual hamfest. RHP was a Ranger. RRM was the principal speaker; MCs were LZV, IQW, and WJ1. The 75-meter transmitter hunts were won by QWJ and OLD; the 10-meter transmitter hunts by KMH and TUU. The Texoma Amateur Radio Club of Sherman had emergency duty on April 6th, when a tornado struck in the area. Those participating were UTB, IDZ, POG, LDG, SGR, DGG, and UIQ. Public recognition of the part played by amateurs was written up in the Sherman paper by Civil Defense Director Dick Raggsdale and Auxiliary Police Chief Raymond Tucker. The East Texas Amateur Radio Club participated in the Warm Springs Foundation Telethon on March 19th and 20th. Stations participating were ZJM, MAW, HBD, OIS, CTF, HAJ, IJY, VAN, WYH, IWQ, FOY, YIU, AFR, AFY, AFW, IZU, and WVH, who reported. Traffic: K5TFB 1202, K3FFB 1101, W3DTA/5 807, KPB 597, ACK 220, AHC 199, FJB 194, UBW 194, ASA 78, TTU 57, CF 24, ZTG 20, FCX 13, BPT 8, OCV 8, FIT 7, EOZ 6, TFP 5.

**OKLAHOMA**—SCM, Dr. Will G. Crandall, W5RST —Asst. SCM: Ewing Canady, 5GIZ. SEC: KY. RM: GVS. PAMs: PML, SVL, and ROZ. New officers of the Tulsa ARC are SWJ, pres.; AAL, vice-pres.; DCF, secy.; EYK, treas.; KY, pub. rel. New officers of the Pittsburg Co. ARC are UAO, pres.; OQM, vice-pres.; GXH, secy.-treas.; AKH, pub. dir. Tulsa Central I.L.S. has plans for a station. ORH has 300 watts mobile on a.s.b. PZW has moved to Kansas City, Mo. TFC pulled two awards at two college science fairs for a photo-voltaic-cell powered transistor audio oscillator. The ACARC has incorporated and now has 55 members, all ARRL members. FCV is a new ham at Enid and light surgeon at Vance AFB. GVS reports increased activity on OIZ, the Oklahoma c.w. net, which expects to continue operation all summer. An attempt is being made to better the present auto license plate bill to

(Continued on page 112)

# WHILE NEW YORK CITY SLEEPS Amperex® VHF TUBES STAND GUARD

... and over 70,000 Amperex 5894 or 6252 VHF transmitting tubes are now in use all over the country, in approved equipment by Fire Departments, Civil Defense, Police and other Municipal Emergency Services . . .

**because  
Amperex TUBES  
have proven  
MOST DEPENDABLE**

If disaster should strike, will your communication equipment meet the test? In time of disaster, there is no substitute for dependability — even initial cost becomes secondary! Long life, ruggedness, and reliability were the watchwords in the final selection of these tubes. If you are planning new fixed or mobile stations, insist on AMPEREX type 5894 or 6252 to be sure!

COMPARISON PROVES AMPEREX SUPERIORITY					
Maximum Plate Input & Voltage VS Frequency (Push-pull, Class C Operation)					
Service ICAS	Frequency Band (Mc)	AMPEREX 6252		Nearest Rated Competitive Tube	
		Plate Input Watts	Plate Volts	Plate Input Watts	Plate Volts
Plate	144-148	72	600	49	435
Modulated	220-225	72	600	44	370
Telephony	420-450	51.5	475	31	300

The AMPEREX 6252 ICAS higher voltage and input ratings show the advantage of the independently suspended anode construction which eliminates the need for internal insulation. Competitive tubes use mica insulators between the plate and the rest of the internal structure, resulting in low maximum anode voltage and greater derating at higher frequencies.

**RETUBE  
WITH Amperex**

**AMPEREX ELECTRONIC CORPORATION**

230 Duffy Avenue, Hicksville, New York

In Canada: Rogers Majestic Electronics Ltd.

11-19 Brentcliffe Road, Leaside (Toronto 17)

Sonar Radio Corporation's FCDA-approved, Model CD-2 Transmitter, designed for CD fixed and emergency operation uses the Amperex type 6252.

Radio Engineering Laboratories' Type 715 Transmitter, used by New York City's Fire Department, employs the Amperex type 5894.

# NEW VERTICAL ANTENNA

## Provides Amazing Results

... even on LOW POWER

- Self-supporting
- Base insulated for 20,000 volts
- Hot-dip galvanized tubular steel construction
- Easy to erect with interlocking sections

New Lewis Vertical Antenna is equipped with winch-operated Snorkel Mast which permits you to vary the electrical length of your antenna by 18 feet! Screw-in anchor feet withstand 4,000 pounds strain . . . field tested in 80-mph winds! Requires less than 1 square yard at base . . . low standing wave ratio characteristics . . . broad band. Lewis antenna can be erected by two men in two hours or less. Mail coupon today for free details.

provide two plates in lieu of the regular plate and available for mobiles only somewhat similar to the present Texas and Virginia laws. Thanks are due Senators Wilson and Frazier and Rep. Norman for authoring the bill and we should do all we can to persuade its passage. We cannot stress too strongly courteous driving practices and extreme caution while mobiling. The h.f. bands are on their way back, as witness the 15-meter band which is very hot at times. Traffic: W5PMJ 791, FEC 583, GVS 322, JXM 251, HCG 144, MGK 78, SVR 67, GXH 63, ZKK 58, QAC 52, FU 48, CBY 46, PNG 45, ADC 44, TNW 42, MFX 31, RST 31, CFG 29, MQI 16, CXM 11, ESB 8, ITF 8, SWJ 7, UCT 3, PAA 2.

**SOUTHERN TEXAS**—SCM, Morley Bartholomew, W5QDX—DTJ and ZIN are fighting it out to see who gets WATC (Worked All Texas Counties). MN still is spending most of his air time handling traffic. YXH is building a new kw. c.w. rig. Vince says the jr. operator, EDG, is crowding him. Congratulations, Vince, on qualifying for Class 1 OO. GQ is on 75 meters with a 20A s.s.b. exciter. JKC and LDU have moved to Fort Worth. UB gave a talk on s.s.b. advantages to the SARC members at their regular meeting. SMG received his "Greetings" from Uncle Sam. We'll miss him around these parts. FJX is back on the air at his new QTH in San Antonio. The Austin mobile gang is active on 29.200 Mc. Hidden transmitter hunts are staged every Saturday night. QEM is your new SEC. If you are interested in becoming EC for your city and are willing to devote the time to it, contact Roy. QZJ is EC for the Austin Area. Mobile operators: Now is the time to fill out and file Form 53 for your 1956 call letter plates. You must make applications each year. October 1st is the deadline. Traffic: W5MN 786, DTJ 24.

**NEW MEXICO**—SCM, Einar H. Morterud, W5FPB—SEC: KCW. PAM: BIW. V.H.F. PAM: FPB. RM: JZT. The NMEPN meets on 3838 kc. Tue. and Thurs. at 1800 MST, Sun. at 0730; the NM Breakfast Club every morning except Sun. at 0700-0900 MST on 3838 kc.; the NM C.W. Net daily on 3633 kc. at 1900 MST. Balloting for SCM resulted as follows: FPB 100, BIH 69. K5AQK reports into the Breakfast Club from Clayton. Other calls heard on 3838 kc.: BRV, AGX, KMC, BWV, BLO, GZG, GQA, DVA, FGH, VIA, HVE, FEF, COS, BCT, RNG, EFT, CHX, GGO, and HOE. New officers of the Hobbs ARC are: RES. pres.; JVX, vice-pres.; Harold Windle, secy-treas.; FTP, act. mgr. ZU, as retiring SCM, wishes to thank all who diligently reported activities, and the gang who were always in there for net activities. Let's have more make BPL to qualify for the BPL traffic medallion described on page 73, May QST. QR has had bad dust static during recent months at Presbyterian Sanatorium and is unable to get on because of his health. AKR reports hospital QRM. Traffic: K5WSP 891, W5RFF 134, JZT 110, CEE 49, ZU 23, BZB 13, BZA 7, BXP 4, DWT 4, HOE 4, WBC 2.

### CANADIAN DIVISION

**MARITIME**—SCM, Douglas C. Johnson, VE1OM—Asst. SCM: Fritz A. Webb, 1DB. SEC: RR. New appointees: FH, Cape Breton EC: AAY, N.B. EC: ABZ and WK as OPSS. Ex-1HT now is WP. ZL is ex-1EBand VO6EP. SM7MG was a recent visitor to Halifax. Ex is active on 75 meters with 35 watts. Newt depends on a 500-watt plant for power. ACL reports formation of the PEI Emergency Net. DQ is heard from his Grand Lake summer QTH on 75 meters. LZ is with CBC in teleline work. VO2B has left for Ottawa. VO1T assumes duties as c.d. communications officer. VOID is an EC. AECs are VO1T and VO1AB. VO1AB has a new mobile and held a transmitter hunt in April. VO1AM and VO1AN are on 'phone. VO2CM is building a new all-band rig. VO2AG is QRL with mobile gear. VO2AW is going linear. W4SIY-VE1 is operating from Shelburne using a Viking Ranger. IC is going north for the summer as operator on the CGS *Cornwallis*. VO6U plans to go on 50.44 Mc. VE1GH is being heard again on 20 and 75 meters. The ARRL Maritime Convention will be held at St. John the last two days of July. UT expects to be mobile shortly. The Maritime 'Phone Net meets every evening on 3750 kc. at 7:00 ADT and will welcome visiting U. S. mobile stations calling in when up in the VE1 area. This net ties in with the TCPN and can QSP any messages back home. I/I is heard on 75 meters operating from Camp Gagetown, N. B. Traffic: VE1FQ 180, DW 175, VO6AH 109, VE1OC 70, VO6U 62, VE1QM 60, VO1T 48, VE1AV 46, OM 29, VOID 26, VE1UT 21, ME 18, BL 12, GA 10, WK 7.

**ONTARIO**—SCM, G. Eric Farquhar, VE3IA—The Nottown Club of Toronto was host to Lee Aurick, W1RDV, Assistant Secretary of ARRL, who addressed the meeting on the legislation of ham radio and showed the film "Ionosphere and Effect on Radio Waves." NG shares a new transmitter with the XYL, DZA. AVS, DTO, and DAR now are mobile. RU has returned from Mexico, DTO and DIL now are Class A. BUR keeps early morning skeds with the help of a new receiver, PH mobiles to the Maritimes. AUU enjoyed the Oshawa Hamfest. AQE and AWQ attended the Dayton Hamvention. AWQ was the happy winner of a Collins transmitter. The fingers of BSW lost out with the garage door in an accident. The Ottawa Club

PENTA LABORATORIES, INC.  
312 NORTH NOPAL STREET,  
SANTA BARBARA, CALIF.

held a banquet and auction night. Cayman Island Night was held at the Hamilton ARC when CJ took the gang on a travel to that paradise of the West Indies and told about his third trip. He operated under the call VE5BP to give many a new country. As one who heard Noel, I extend thanks for such an evening. Traffic: VE3BUR 191, AJR 163, NC 93, VZ 93, DPO 90, ATU 30, KM 27, NO 24, AOE 10, AVS 7, VD 6, PH 5, TO 5.

ALBERTA — SCM, Sydney T. Jones, VE6MJ — PAM: OD, RM: XG, WC says he is getting TVI troubles like 1. AL is operating 'phone on 3.8 Mc. PS has qualified for 'phone operation. OC is back on the air from the new Edmonton QTH. ZR is QRL with new mobile installation. NX and MJ both are chasing the elusive DX. EP is building a new receiver. YE is QRL with plans for his daughter's marriage. The code practice sessions heard on 3768 kc. during the past months will be suspended during the summer months but will be resumed in the fall. JP is working on an oscilloscope for modulation purposes. Traffic: VE6HM 88, AL 21, WC 12, MJ 4.

BRITISH COLUMBIA — SCM, Peter M. McIntyre, VE7JT — SEC: DH. Summer being well on the way everybody will be doing all the usual summer antenna repairs, and dodging the ever-present household chores. Barring the few traffic reports this month there is not much to report. The mobile activity is picking up now that the good weather is here with hidden transmitter hunts and mobile pioni in the offing. The last hidden transmitter hunt of May 1st was taped and should have been heard on the CBC Roving Reporter series on the local Vancouver CBC station, CBU. Last month's column, I hope, will bring some things to report next month. Keep your ears open for 7JB, whose aim has been to start a swap and shop gimmick for the amateurs at a convenient location. It should prove very beneficial for the amateurs to trade or swap for the stuff they need with what they have that someone else wants. Also every Wed. night on the AREC Net on 3755 kc. is the swap column night. There is a list of phonetics printed in the *Handbook*. It would save a lot of the net's time if the stations would use phonetics, especially when making relays. Give it a try! Traffic: VE7QC 208, ASR 105, AQW 44, AUF 32, AIO 16, ZV 14, ZF 9.

MANITOBA — SCM, John Polmark, VE4HL — OO: RB, LO, now tractor mobile, hasn't quite licked the noise yet. EF finally has gotten his 20-meter beam working. KG is going to have a try at mobile. The AREC is off to a fine start. How about some more applications? GV has his rig working again. Glad to see you back, Jimmy. VE3DVF/M4, ex-4AX, was back for a short visit with his FB mobile. AY is back after having transmitter troubles. Congratulations to NX on getting his commercial flying ticket. NW finally is getting moved to the lake. How about a few activity reports? Traffic: VE4AI 28, KL 12, HL 10, YR 10, KG 9, EF 7, FF 6, XP 4, GB 2, OB 2.

SASKATCHEWAN — SCM, Harold R. Horn, VE5HR — This report is being made up at the hospital, my QTH for the past two months. I would like to say thanks to all the gang for the kind wishes that have been received, both via 75 meters and by card. Through the courtesy of TH I have an S-38 and it has given me many pleasant hours listening in on the bands. BD is on 28-Mc. mobile 'phone. BZ is going to 14 Mc. for the summer. FG is QSY Moose Jaw. When two local public schools held Hobby Shows, BG and HR set their stations up. A number of contacts were made and the display was well received by the public as well as the school children. JO has been promoted with the Power Corporation and is now located at Regina Beach. We regret to record the passing of SD on Apr. 13th. He will be greatly missed by the Prince Albert Club. DR made BPL with his traffic handled during the big blow. 5AJ and 6AL were instrumental in locating an overdue aircraft en route to Saskatoon during the big storm. Traffic: VE5DR 177, YF 33, RE 26.

## **CHECK THESE OUTSTANDING FEATURES**

### **POWER**

Enough to—

- ▶ Drive a KW grounded grid linear
- ▶ Use as a complete Transmitter

### **FLEXIBILITY**

- ▶ Bandswitching 10-15-20-40-80-160 meters
- ▶ SSB-AM-CW operation at the flip of a switch
- ▶ VFO BUILT IN. Calibrated in 1 K.C. divisions—ALL bands
- ▶ Selectable sideband operation at the flip of a switch

### **RELIABILITY**

- ▶ Triple cascade crystal filter provides excellent carrier and unwanted sideband suppression. (80 db unwanted sideband, 100 db carrier suppression). Filter guaranteed for the life of the unit

### **OPERATION**

Real operating ease and convenience afforded by—

- ▶ Built in voice control circuits (plug-in voice control relay)
- ▶ Built in speaker control circuits
- ▶ All operating controls at the fingertips on front panel
- ▶ VFO operates continuously. Unit requires no "warm-up" period

### **RUGGED CONSTRUCTION**

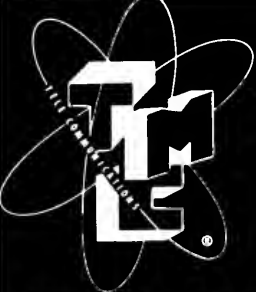

- ▶ Panel,  $\frac{1}{8}$ " steel relay rack type. Beautiful Concord Blue finish
- ▶ Cabinet,  $\frac{1}{16}$ " steel. Contrasting Marine Blue finish. Size, 21" wide, 15" deep, 10 $\frac{1}{2}$ " high. Weight complete, 67 lbs. Domestic shipping weight, 76 lbs.

**ELENCO "77" complete, \$695.00**

## S.S.B. VFO

(Continued from page 12)

hold the loop thus formed. The tap should be tinned before the coil is mounted, to facilitate connecting the lead from  $C_4$ .  $L_5$  is wound in a straightforward manner, terminating on the split-ring terminals provided with the LS-3 coil form.  $C_{10}$  is connected across the coil to these same rings. After winding, both coils should be coated with coil "dope."  $L_2$ ,  $L_3$ , and  $L_4$  are pre-wound coils and can be adjusted to resonate to the required frequencies with tube and circuit capacitances.

Most wiring can be completed point to point, except the B-plus, which is terminated on tie points. In the Central Electronics exciter the 6.3-volt filament supply has its center tap grounded, necessitating a two-wire filament circuit. The wiring to the oscillator section was run in the fold of the chassis and didn't have to go through the shield since there was sufficient room for these leads between the shield and the chassis. However, the wires could be fed through a 1/4-inch rubber grommet if necessary.

The interconnecting cable is made up of 3 ordinary leads and a piece of coax for the r.f. The plugs on each end, and their connections, will be determined by the type of socket on the exciter (octal on the 10-A) and  $J_1$ . The cable was taped with Scotch electrical tape for neatness.

### Adjustment

First, check all wiring and determine that no errors exist. Then connect the cable between the exciter and the VFO. Turn on the exciter and determine that both tube filaments light. Do this with the VR tube out of its socket as the jumper in the tube will open the B-plus to the tubes. Remove both tubes from their sockets, replace the 0B2 and adjust the dropping resistor for 23 to 25 ma. of current through the VR tube. Next, insert the oscillator tube,  $V_1$ , and listen around 5 Mc. in the receiver for the oscillation. It would be wise to connect a low-range milliammeter between the cathode choke and ground. It should indicate approximately 10 ma. Peak the signal with the slug in  $L_2$ .

Now comes the important part, to determine the range of the oscillator from maximum to minimum capacity. It will be more than the required 500 kc. Set the 5-Mc. point at 5 on the logging scale, by adjusting the slug in  $L_1$ . Now carefully remove one plate at a time from  $C_1$ , readjusting  $L_1$  as necessary. As each plate is removed, record the new range of the oscillator on a piece of paper. As you progress, a pattern will emerge of the ratio of change as each plate is removed. When the 500-ke. range occupies *almost* all of the scale, the pattern will warn you that to take off *one* plate more will be one too many. This procedure determines the bandwidth of the VFO. The writer's VFO covers the 500 kc. needed between 5 and 93 on the logging scale of the MCN dial.

Next, plug in the buffer/multiplier tube, set

(Continued on page 118)

# A Paying Proposition!

Maintenance of commercial mobile-radio installations is big business... still growing fast... pays good money... and regularly!

It's a natural for hams!

HERE ARE THE TEST INSTRUMENTS  
PREFERRED BY EXPERIENCED ENGINEERS:

**LAMPKIN 105-B MICROMETER  
FREQUENCY METER**

Heterodyne type. Range 0.1 to 500 MC., all channels. Pinpoint VHF CW signal source. Weight 13 lbs. Width 13". Price \$220.00 net.

**LAMPKIN 205-A  
FM MODULATION METER**

Measures FM voice deviation,  $\pm 25$  KC. Tunes 25-500 MC. in one band. Speaker. Oscilloscope output. Weight 13 lbs. Width 12". Price \$240.00 net.

Both instruments meet FCC mobile specs... are easy-to-carry... but rugged and accurate.

You can build your radio knowledge into a profitable business, full- or spare-time! How? ... ask for booklet "How to Make Money in Mobile-Radio Maintenance". No charge... Act Now!

## Air-System Sockets

**Eimac** air-system sockets are custom designed to provide adequate cooling with the most economical blower requirements for several Eimac radial-beam power tetrodes.

**4-400A, 4000** air-system socket is employed with Eimac tube type 4-400A. Air enters through the bottom of the socket and is guided by a pyrex glass chimney, assuring efficient cooling of the various seals. If desired, this socket may also be used with Eimac 4-125A and 4-250A.

**4-1000A, 4000** air-system socket is designed for use with Eimac tube type 4-1000A. Air entering the bottom of the socket is guided by a pyrex glass chimney toward the plate seal, assuring correct cooling even during maximum rating operation of the tube.

**4X150A, 4000** air-system socket provides adequate air cooling and high frequency circuit arrangement for Eimac 4X150A and 4X150D. Air enters the socket through the bottom and is guided by a ceramic chimney.

**4X150A, 4010** socket is identical to the 4X150A, 4000 except that this socket is complete with grounded cathode connecting tabs.

Eimac air-system sockets and chimneys are also available as separate units.

For further information contact  
our Amateur Service Bureau.

## Facts About Learning Code

**TELEPLEX** is the method that teaches all phases of Code: Unlimited number of practice tapes contain actual sending of many different operators. **TELEPLEX** records your own sending and repeats it back to you. You SEE and HEAR your own signals. Perfect way to learn to use bug. Automatic CQ'ing. Perfect automatic transmission to put Code practice on the air. You can try it before you rent or buy it. Speed range 5 to 75 words. "Facts About Learning Code" is free and interesting. Write for it today. See it at Blau's, 64 Dey St., New York City

**TELEPLEX CO.** 415 G. St., **MODESTO, CALIF.**

the bandswitch in the 80-20 position, and with the dial near midscale peak the slug in  $L_4$ . There should be some increase in signal strength in the receiver as the gain of the buffer stage is added. Next, set the bandswitch to the 160-meter position and listen for the signal around 10.9 Mc. Peak  $L_3$  for maximum signal. The VFO dial will have to be moved toward the 5.5-Mc. end. Next, set the dial near the 5.4-Mc. point and the bandswitch to the 40-meter position, and look for the signal around 16.2 Mc. on the receiver. Now peak  $L_5$ . For accurate placement of the 5.0-Mc. point (about 5 on the logging scale) zero-beat the oscillator with the 5-Mc. signal of WWV and adjust the slug in  $L_1$ . This completes the adjustment, but after attaching the cover (bottom plate) with sheet metal screws, recheck all the above adjustments, touching up the slugs where needed.

The oscillator adjustment procedure can also be used to adjust the bandset dial on two-dial receivers. With the 10-A in "Cal," set the bandspread dial on the receiver to 4.0 Mc., then carefully tune the bandset dial until the signal is heard zero beat. The receiver is then calibrated for the 75-meter band at 4.0 Mc. (provided the 9-Mc. crystal in the exciter actually is on exactly 9 Mc.).

Your VFO is now ready to give you s.s.b. operation on four bands.

## Receiver Modifications

(Continued from page 27)

### Appendix II

Revision of 75A-3 to use 6DC6 or 6BZ6 as r.f. amplifier. All resistor tolerances  $\pm 10$  per cent unless otherwise marked.

For sets serial number 1299 and under using the 455B series of mechanical filter:

- 1) Replace 6CB6 with 6DC6 ( $V_1$ ).
- 2) Remove  $R_{66}$  (120 ohms) and  $C_{106}$  (cathode by-pass), tie Pins 2 and 7 of r.f. amplifier to chassis.
- 3) Remove  $R_{65}$  (1.5 megohm). (Some sets may use 1 megohm.)
- 4) Change  $R_7$  ( $V_2$  cathode) from 68 ohms  $\frac{1}{2}$  watt to 180 ohms  $\frac{1}{2}$  watt.
- 5) Check to see that Pins 2 and 7 of  $V_1$  are connected to chassis. If not, connect them. (This modification has been made on sets with serial numbers higher than 950.)
- 6) Remove a.v.c. from Pin 3 of mechanical filter box assembly. Connect Pin 3 of filter box to junction of  $R_{57}$ ,  $R_{58}$  (r.f. gain control and minimum bias resistor).
- 7) Add  $R_{84}$  (100 ohms,  $\frac{1}{2}$  watt) between  $R_{50}$  and Pin 7 of  $V_7$ . Move junction of  $R_{67}$  and negative side of meter to opposite side of  $R_{50}$ .
- 8) Change  $R_{67}$  (meter shunt) to 220 ohms,  $\frac{1}{2}$  watt  $\pm 5$  per cent.
- 9) Change  $R_{47}$  to 220 ohms,  $\frac{1}{2}$  watt  $\pm 5$  per cent.
- 10) Change  $R_{50}$  to 56 ohms,  $\frac{1}{2}$  watt  $\pm 10$  per cent.

For sets serial number 1300 and over using 455C filter:

- 1) Replace 6CB6 with 6DC6 ( $V_1$ ).
- 2) Remove  $R_{66}$  (120 ohms) and  $C_{106}$  (cathode by-pass), tie Pins 2 and 7 of r.f. amplifier to chassis.
- 3) Remove  $R_{65}$  (1.5 megohms).
- 4) Change  $R_7$  ( $V_2$  cathode) from 68 ohms  $\frac{1}{2}$  watt to 180 ohms,  $\frac{1}{2}$  watt.

## CENTRAL ELECTRONICS SSB EQUIPMENT

**Multiphase Exciter... Model 20A**  
20 watts peak envelope output on AM, PM, CW and SSB. Single switch for sideband selection. VOX on AM, PM and SSB, plus break-in on CW. Bandswitching: 160 thru 10-meters. Has magic eye indicator for carrier null and peak modulation. Choice of table or rack model.

Wired..... **\$249.50** Kit..... **\$199.50**

**Model  
600L**

### Broad-Band Linear RF Amplifier

No tuning controls except single knob band selector covering 160 thru 10-meters. Requires only 2 watts effective or 4 watts peak envelope drive power for 500 watts DC input. 60 to 65% linear efficiency. Single 813 operates AB<sub>2</sub>. Meter reads input power in watts, grid current, output in RF amperes, and shows reflected power with mismatched load. Has input level calibrations for AM, PM and CW. Self-powered with regulated bias and screen voltages. RF is shielded and by-passed for effective TVI suppression. Choice of table or rack model.

Complete with tubes..... **\$349.50**

## PALCO Mobile Equipment

Now in Stock for Immediate Delivery

## PALCO BANTAM 65 MOBILE TRANSMITTER

Smallest and most compact mobile xmtr made. Power input: 65 watts phone and 90 watts CW. Measures only 4 x 8 x 8 3/4", and uses separate speech amplifier and modulator on chassis 2 x 2 7/8 x 11". Features include: Built-in VFO plus 2 crystal positions — 80 thru 10-meter bandswitching — gang-tuned VFO and Exciter — Pi-section output — VOX operation with built-in antenna changeover relay and receiver disabling circuit — TVI suppression — power required: 400-600 volts @ 200-250 ma and 6 or 12 volts for heaters. Complete RF unit, speech amplifier and modulator (with tubes and connectors) **\$159.50**

**New**  
**ELDICO**  
VF010/20A

Designed expressly for Central Electronics SSB Exciters Model 10A, 10B and 20A. Variable frequency oscillator for 75 and 20-meter bands. Complete band coverage on 75 and 20 meters. No modification of exciters required.

Wired..... **\$49.95** Kit..... **\$39.95**

## GONSET

### Linear RF Amplifier

Single knob bandswitching covers 80 thru 10-meters with provision for 160. Pi-network output circuit matches 50 to 300 ohm loads. Four 807's operate class AB<sub>2</sub> and provide substantial power output with low grid drive. Circuit is completely stable and free from parasitics and self-oscillation. Complete metering of individual 807 cathodes, grids and relative RF output. Overload relay and warning light protect screens. Self-powered.

Complete with tubes..... **\$339.00**

## B & W SSB EQUIPMENT

**Model  
5100S  
TRANSMITTER**

Bandswitching on 80 thru 10-meter bands. Operates VFO or crystal on CW or phone. Input power: 135 watts phone and 150 watts CW. Features Pi-network output, built-in low-pass filter and TVI suppression. Has accurate, stable VFO. Provides 75 watts audio output at 500 ohms. Self-powered.

Complete with tubes  
**\$467.50**

**Model 51SB  
SSB GENERATOR**

Designed for use with 5100S transmitter. Bandswitching on all ham bands, 80 thru 10-meters. VFO or crystal control on AM, CW and SSB. Features VOX on SSB and speaker deactivating circuit. Self-powered.

Complete with tubes..... **\$279.50**

**TECHNICAL MATERIEL CORPORATION**  
Mamaroneck, N. Y.

5) Change  $R_{81}$  from 4700 ohms,  $\frac{1}{2}$  watt to 10,000 ohms,  $\frac{1}{2}$  watt.

6) Change  $R_{67}$  to 150 ohms,  $\frac{1}{2}$  watt (S-meter shunt).

7) Remove a.v.c. from Pin 3 of mechanical filter box assembly. Connect Pin 3 of filter box to junction of  $R_{57}$ ,  $R_{58}$  (r.f. gain control and minimum bias resistor).

### Appendix III

Conversion of 75A-2 to replace 6BE6 mixers with 6BA7s.

1) Carefully unsolder pin connections of  $V_2$  and  $V_4$ .

2) Remove 7-pin tube sockets and ream out holes to  $\frac{3}{4}$  inch for clearance of 9-pin sockets. Be sure that all loose chips are removed from set, especially around bandswitches.

3) Mount new tube sockets. Orient  $V_2$  socket so that Pin 7 is closest to r.f. amplifier. Orient  $V_4$  socket so that Pin 2 is closest to crystal oscillator tube,  $V_3$ .

4) Wire sockets per schematics in Fig. 4, being sure that all grid and plate leads are as short as possible and that all chassis connections are returned to the same point they were made to in the original set-up.

### Appendix IV

Revision to improve shape of i.f. selectivity curve.

1) Remove  $C_{110}$  (top coupling for  $T_6$  — not present in all models).

2) Add 82,000-ohm  $\frac{1}{2}$ -watt resistor across terminals A and C of  $T_6$  ( $R_{83}$ ).

3) Realign 455-ke. i.f. using the following procedure:

a) Connect v.t.v.m. d.c. lead to diode load (junction of  $R_{39}$  and  $R_{42}$ ).

b) Connect signal generator output to receiver antenna terminals. Set signal generator to some frequency in the 80-meter band. Do not move signal generator frequency during the rest of the 455-ke. i.f. alignment procedure.

c) Tune receiver to signal frequency.

d) Adjust signal generator output control for an S-meter reading of S9 + 20 db.

e) Tune receiver to the S9 point on the high-frequency side of the signal. Record the dial reading.

f) Tune receiver to the S9 point on the low-frequency side of the dial. Record the reading.

g) Set the dial halfway between the readings determined in steps (e) and (f).

h) Set the fiducial (zero set) accurately to some dial division. During the following adjustments, attenuate the signal generator output to keep the v.t.v.m. readings below 5 volts.

i) Tune dial 3 kc. lower than the center frequency (determined in step (g)). Adjust  $T_6$  (both top and bottom slugs) for maximum v.t.v.m. readings.

j) Tune the dial 3 kc. above center frequency. Adjust  $T_3$  and top and bottom slugs of  $T_7$  for maximum v.t.v.m. reading.

k) Retune to center frequency determined in step (g) and tune  $C_{32}$  (plate of  $V_{18}$ ) for maximum readings.

### Appendix V

Revision to improve a.v.c. noise immunity.

1) Replace  $C_{52}$  with .05- $\mu$ fd. 300-volt capacitor (grid-plate coupling at V9).

2) Replace  $R_{35}$  with 0.33-megohm + 10 percent,  $\frac{1}{2}$ -watt resistor (grid-plate coupling at V9).

3) Replace  $C_{51}$  with 0.2- $\mu$ fd. 200-volt capacitor (grid shunt at V9).

4) Add 180- $\mu$ fd. mica or ceramic capacitor from Pin 2 of V9 to chassis.

5) Remove  $C_{98}$  (on a a.v.c. line).

### 500 WATT Completely Bandswitching

IMMEDIATE DELIVERY!

### GLOBE KING

Here's an advanced design, high power transmitter of 500 watts input on both CW and tone 100% modulated. Is completely bandswitching 10 thru 160M. bands. Consists of RF, Speech Modulator and Dual Power Supply Sections. Entire unit is specially screened for TVI. Pi Network output matches any antenna work 52-600 ohms. Has provisions for VFO and Single Sideband input. Forced air-cooled 4-250A tube, push-to-talk, special aluminum mesh screening of RF Section — just a few of the many fine features. Enclosed in grey hammertone cabinet, 31"x21 3/4"x15".

**ONLY \$367<sup>8</sup> per mo.**

# 2, 6, 160-10 METER TRANSMITTERS

## LETTINE MODEL 240 TRANSMITTER WITH MOBILE CONNECTIONS AND A.C. POWER SUPPLY

This outstanding transmitter has been acclaimed a great performer throughout the world. Air wound plug-in coils used for high efficiency. Takes any freq. from 1.6 to 30 mc. Ideal for General Class, Novice, C.A.P., C.D., Industrial. Sold direct from our factory, ready to operate. 40 to 50 watts input. Phone-CW. Complete with 8 x 14 x 8 cabinet, 40 meter coils, xtal. tubes: 6V6 osc., 807 final, 5U4G rect., 6S17 xtal mike amp., 6N7 phase inv., 2-6L6's P.P. mod. Wt. 30 lbs. \$79.95. 80, 20, 10 meter coils \$2.91 per band, 160 meter coils \$3.60.

**MODEL 130 FOR 120 TO 130 WATTS—\$199.50**  
807 osc., 2-807's final, 6N7 xtal mike amp., 807 AF driver, 2-807's mod., 2-866A's rect., 6L6 clamper. Wt. only 47 lbs.

**MODEL 242 FOR 2 METERS—45 WATTS INPUT—  
6146 FINAL.** Complete with mobile connections, A.C. power supply, tubes, xtal. Xtal mike input. Uses 8 mc. xtals. Swinging link matches 52—300 ohm antennas. Same cab. as 240. \$89.95. Also 6 meter model.

## Break-In Keying

(Continued from page 28)

If the action just described is not obtained, you probably have the rectifiers connected backwards, and they should be reversed. It should be apparent, of course, that the same principle can be applied to a transmitter currently using grid-block keying, since the pertinent parts of the keyed circuit are similar. A vacuum tube diode can be used in place of the selenium rectifier, but it must be shunted by a high resistance to simulate the back resistance.

I have been using this system for two years and have no reason to ask for more. The keying is clean because the characters are being formed in the next to the last stage of the transmitter, and no back wave is heard with the key open and the receiver set at above normal gain.

## Six Meters

(Continued from page 32)

Such a coupler or balun can be connected anywhere: at the transmitter, at any convenient point between the rig and antenna, or at the antenna itself.

An antenna system that is designed for 300-ohm Twin-Lead feed, such as the 4-element array described in all the *Handbooks*, can be fed with coax and either of the coupling devices shown in Fig. 2. The coupling circuit of Fig. 2A can be used with either 50- or 75-ohm coax, and the line can be any balanced transmission line presently available. The components of the coupler can be similar to those used in the plate and output-coupling circuits of the final stage.

Adjustment of the coupler and the antenna system can be done positively only if a standing-wave indicator of some sort is inserted in the coaxial line. Adjustments should be made for minimum standing-wave ratio first, and then the coupling at the transmitter should be set for the desired loading. A low s.w.r. is particularly important if coaxial line is used all the way to the antenna system. The design and use of s.w.r. bridges are covered in all recent *Handbooks*.

## VIBROPLEX X Semi-Automatic Key

The Vibroplex bug does all the arm-tiring work for you — automatically. Relieves nervous and muscular tension so noticeable when sending by hand. Suits any hand. No special skill required. Adjustable to any speed and any degree of key tension. Easy to operate. Beginners use it in a matter of minutes. Built for long life and rough usage. Vibroplex is the only key with **Jewel movement** — insuring better and easier keying. Used and recommended by thousands of hams and commercial operators on land, sea and in the air. Five models, \$12.95 to \$29.95. Left-hand models, one dollar more. Order yours today. At dealers or direct. **FREE** folder.

Headquarters for **NEW** portables, all models and styles of type. Also, **REBUILT** standard and portable typewriters with **ALL CAPITAL** letters and other styles of type. **Quick service.** Get our prices before you buy!

### A FABULOUS BARGAIN FOR JUST 67 "QST" READERS!

FINAL CLEARANCE to a handful of music lovers who recognize A STEAL and act fast! The V-12 tuner was enthusiastically reviewed last Spring by High-Fidelity magazine. Radio Shack customers the world around have thrilled to its fidelity and sensitivity. Now, because we have reached the bottom of the barrel, and because we're *sold out* of the separate (easily built) required 6.3V AC @ 4 amps, 190V DC @ 55 ma. power supplies, we've reduced our remaining stock of these excellent tuners at LESS than replacement cost! Other features: miniature 8 1/4" W x 5 3/8" H x 8" deep size; AVC on AM; tuning, power, bandswitching controls; neon band lamps; 6-gang condenser; full standard RETMA guarantee!

## What's the Answer?

(Continued from page 35)

frequency, expressed in kilocycles or megacycles. In the early days of radio, amateur bands were listed by meters. In the interest of accuracy, the "powers-that-be" switched to frequency designations for the radio spectrum. However, habits die hard, and although the change was made in the late '20s, it is still common practice to use meters as band designations.

If one wishes to convert frequency-in-kilocycles into wavelength-in-meters, and incidentally, this is a question sometimes asked in the Novice exam, the following formula is used:

$$\lambda = \frac{300,000}{f}$$

where  $\lambda$  = Wavelength in meters  
 $f$  = Frequency in kilocycles

Example: The wavelength corresponding to a frequency of 3500 kilocycles is

$$\lambda = \frac{300,000}{3500} = 85.7 \text{ meters.}$$

## Lightning Protection

(Continued from page 37)

antenna was cut to center on this frequency. Operation is not confined to this frequency, however, as many contacts are made even at the high end of the band without any retuning or adjustment of either the driver or final-stage tuning circuits.

The antenna is 125 feet long and the quarter-wave Zepp feeders are 62½ feet long, spaced 6 inches apart. The feeders are tied together at the lower end and grounded. A metal rod 6 inches long is used as the lowest spacer. RG-11/U (72-ohm) coax is used to feed the Zepp feeders. The shield of the coax is attached to the feeder which goes to the antenna and the center conductor goes to the other feeder which dead ends at the antenna. The point of attachment is about 24 inches from the shorting bar. The coax is tied to the feeder to which the shield is connected and follows it back to the shorting bar and then follows the ground lead to the ground stake and from there runs underground to the house.

By now you are wondering why the shield is connected to the feeder which goes to the antenna instead of being attached to the feeder which dead ends. Actually, it makes no difference which way you do it, except that if you use a bridge to check the standing-wave ratio, you will have more trouble with induced voltages from local broadcast stations if you reverse the connection, since the feeder plus antenna picks up much more of this broadcast field voltage than the dead-ended feeder alone will pick up.

Another benefit from this antenna which was entirely unexpected is the reduction in harmonics reaching the antenna. At the desired frequency, the 4 feet of wire between the ends of the coax and the shorting bar serve as a transformer to

(Continued on page 126)

20 WATT POWER AMPLIFIER

MEGAPHONE-Dynamic MICROPHONE Pistol GRIP-TYPE

**All Units BRAND NEW and GUARANTEED**  
**BATTERY CHARGING RACK Included**

Lafayette made a terrific deal with the U. S. Navy—bought a quantity of U. S. Navy Model PAE-2 Portable Amplified Electronic Megaphone Systems which enables us to offer the complete system at a price which can never be duplicated again.

Here is an ideal system for such applications as fishing boats, yachts, traffic control, sports events, construction crews, surveyors, carnivals, car owners, life-saving stations, or any place where handling of large crowds is necessary, and wherever convenient power line connections are not available, because unit operates from self-contained rechargeable 6-volt storage battery. Can also be used as a stationary or permanent system when used with charging rack, which is designed to hold entire portable amplifier and battery.

System consists of portable amplified electronic megaphone—operated by a trigger switch in the pistol-grip-handle—dynamic type microphone unit rated at 50 ohms at 1000 cps, and a reproducing unit, all contained in megaphone mouthpiece and housing.

A powerful 20 watt 6 tube amplifier, housed in a water-proof, two-piece, portable metal case (as illustrated), having compartment for and supplied with 3-cell 6-volt storage battery. Amplifier built with finest quality parts to rigid Navy specifications.

A UNIVERSAL BATTERY CHARGING RACK that operates from 110 volts AC 50-60 cycles, 110 volts DC, 12 volts DC, 24 volts DC, 48 volts DC, or 96 volts DC. The charging rack consists of a battery recharger with time switch and also provides a space for stowing the portable amplifier. Two pilot lights in the front panel of rack indicate a "Low" or "High" charging rate. Timing switch controls the rate of charging. Has separate On/Off switch.

Approximate Dimensions & Weight : Megaphone 20" long, diameter 13 1/2".

Amplifier dimensions—in 2-piece Portable Metal Case, housing 6 volt storage battery—13 3/4" H, 12 3/4" W, 9 3/4" deep.

Charging Rack 15 1/2" H, 13" W, 12" deep.

**COMPLETE SHIPPING WEIGHT 88 LBS.**

Complete System consisting of electronic megaphone, 20 watt portable amplifier with tubes and storage battery in case, as illustrated, Universal Battery Charging Rack with all necessary interconnecting cables and plugs and 30 page Instruction Book with schematic diagrams of all units. **Net 89.50**

match the impedance of the coax to the impedance of the open-wire feeders. At other frequencies, however, this is not the case, and the higher-order harmonics are effectively suppressed. No other filter is used at W4ZG for this purpose and there is no observable interference on a television receiver connected to an antenna just 15 feet away from the Zepp feeders.

Should you wish to use this antenna on other bands, you may do so by reducing the dimensions in accordance with standard antenna formulas. The point of connection of the coax to the Zepp feeders is not critical and may vary somewhat under different surrounding conditions. It can best be done by measuring the s.w.r. at the transmitter end of the coax at several different test positions, but if no bridge is available, the connection of the coax to the Zepp feeders may be made 24 inches from the shorting bar for 80 meters, 12 inches for 40 meters, 6 inches for 20 meters, and 3 inches for 10 meters.<sup>1</sup> It is desirable that the feeder spacing be reduced at the higher frequencies as the length of the shorting bar is a factor in the impedance match.

<sup>1</sup> For antenna systems in which the antenna and feeder lengths are the same as above in terms of wavelength. — En.

## Technical Correspondence

(Continued from page 48)

minimizing the noise figure of the second stage. To calculate the noise figure of this combination we need to calculate the noise contributions of the two tubes, and if for simplicity we assume the two noise figures are identical, the noise figure of the combination can be shown to differ little from that of the first circuit.<sup>1</sup>

If the tap on the interstage coupling coil is left out this circuit becomes the so-called "cathode-coupled amplifier" shown below:

The noise figure of this combination is slightly poorer. Since the two triodes here are directly connected through their common cathodes, a valve often used in this circuit is a Type 6J6 (whose equivalent noise resistance is 470 ohms for each triode section). This circuit is identical to that used by Longerich and Smith, except that a.c. coupling is employed rather than direct coupling and the series-resonated coil in the cathode is replaced by a resistor. The noise figure of the cathode-coupled amplifier is in general somewhat better than the grounded-cathode pentode amplifier. This circuit is, however, inferior to the grounded-cathode grounded-grid triode circuit in both noise figure and stability (i.e., the so-called Wallman circuit<sup>2</sup> or cascode r.f. amplifier<sup>3</sup>). Also, the lower available power gain of the grounded-plate triode means that contributions of third-stage noise are correspondingly greater.

## Happenings

(Continued from page 44)

64) On motion of Mr. Gowan, VOTED that the President appoint a Membership & Publications Committee for the purpose of reporting to the Board at its next meeting recommendations for increasing membership and interest in ARRL among Novices and beginning amateurs. The Committee is requested to consider, among other things, the feasibility of the establishment of a "Student Grade" membership and the publication of a Novice Handbook.

65) At this point, the President announced the following are appointed to the Membership & Publications Committee for the following year: Mr. Maer, Chairman, Mr. Gowan and Mr. Steed.

66) At this point, without formal action, the Board and its General Counsel, at the request of Mr. Cornell, engaged in an extensive discussion of Article 12 of the Articles of Association.

67) On motion of Mr. Roberts, the following resolution was unanimously ADOPTED:

WHEREAS, Karl W. Weingarten, W7BG, had for nearly twenty years served The American Radio Relay League and amateur radio as Director and Vice Director of the Northwestern Division, and

WHEREAS, the institution of amateur radio is deeply grieved by his passing on December 2, 1954

Now, therefore, BE IT RESOLVED, that the Board of Directors of The American Radio Relay League, meeting at Hartford, Connecticut on May 14, 1955, on behalf of amateur radio hereby expresses its deep sense of loss at his passing.

68) On motion of Mr. Maer (on behalf of Mr. Cornell), unanimously VOTED that the Board of Directors of the League authorizes a National Convention to be held in the Pacific Division of the League during the year 1956, under terms as may be approved by the Executive Committee upon receipt of a satisfactory request from a responsible group to sponsor such a convention.

69) On motion of Mr. Maer, unanimously VOTED, that the General Manager is hereby authorized to pay expenses for the operation of the Membership & Publications Committee during the year 1955 in an amount not to exceed \$1000.

70) Whereupon, on motion of Mr. Schmidt, the Board adjourned *sine die* at 10:46 A.M.

71) (Time in session as a Board, 9 hours, 54 minutes; total authorizations \$28,150.)

A. L. BUDLONG  
Q. B. SMITH  
Secretaries

## Hints & Snarls

(Continued from page 45)

ingly working right below. Once I almost had the best beam of anybody in the graveyard.

4) Lay the ladder down gently, Stupid. Don't bounce it off your big toe as I always do.

5) Don't service an antenna, accompanied by 8000 angry bees, without wearing the baby's crib netting over your head. *Caution:* Tuck it in. *Second caution:* If you have a big nose forget the whole beezness.

## Measurements

1) The arc off the final "test." A certain Long Island W2, who should have known better, popped a pretty good bottle that way. Now he's QRP.

2) The "voltage measurement test," also known as the "grabbed it" test. Not accurate, but rather shocking. Use your own calibration system.

3) The "wonder if it's turned on" test. You too?

4) The "whoops, shorted it" test.

5) The "burned finger" test. Quite handy in finding out which tube is cold. It's always the last one.

## Towers and Masts

Amateur radio types • Guyed towers for FM-TV antennas • Vertical Radiators • Microwave towers • Commercial Communication towers • Transmission line supports, etc.

### SERIES 650

Height to 80'  
Width—6.5'  
10' section—  
22 lbs.

Use—Mast for TV  
Amateur, Port-  
able, and Wire  
type antennas

\* Between CG of Tower Legs

### SERIES 2400

Height to 280'  
Width—22.6'  
10' section—  
112 lbs.

Use—Tower for  
Trylon Rotary  
Beam, AM  
Broadcast, and  
Microwave  
antennas

### SERIES 6000

Height to 600'  
Width—60'  
10' section—  
653 lbs.

Use—TV Broad-  
casting and  
curtain antennas  
for International  
Broadcasting

Trylon Towers are made only by

**WIND TURBINE CO., WEST CHESTER, PA.**

## AN/APR-4 COMPONENTS WANTED

In any condition. NEW HIGH PRICES. Also top prices for: ARC-1, ARC-3, APR-1, APR-5A, etc.; TS-34 and other "TS-" and standard Lab Test equipment, especially for the MICROWAVE REGION; ART-13, BC-348, BC-221, LAE, LAF, LAG, and other quality Surplus equipment; also quantity Spares, tubes, plugs and cable.

### ENGINEERING ASSOCIATES

434 Patterson Road

Dayton 9, Ohio

## QST BINDERS

Finished in reddish-brown fabrikoid with stiff covers, each Binder holds twelve issues of QST, opens to any page and lies flat. Your copies are protected and always available for easy reference.

Each — \$3.00

(Postpaid)

**American  
Radio Relay League**  
West Hartford 7, Connecticut

## Expense Accounting

- 1) The amazing surplus prices for brand-new gear (to impress the XYL but not your banker).
- 2) The "leave it in the car and sneak it in after dark" technique.

THE "LEAVE IT IN THE CAR AND SNEAK IT IN AFTER DARK" TECHNIQUE

## Frustration in General

1) Never live on the East Coast. You get all the blackouts and magnetic storms. When it gets so bad back East that you can't even give your neighbor his accustomed TVI, the West Coast goes merrily on its happy DXing way. (Known as East Coast ulcers.)

2) Even though the postman is the ham's best friend, the inflated foreign postal rates will really get you. It's no longer "Will you send me a card?" but "Can you afford it?". Just one more hazard on top of "Sorry you ain't in my log," wrong call on QSL card, essential contact info missing, etc.

3) Incidentally, once the other guy gets your call wrong, you can do a jig, stand on your head, etc., while he says "solid copy R R wrong call R R." Why not a Q signal for "Listen carefully, dumbbell, my call is —"? Do you go off talking to yourself, too?

4) *Never, never, never* put up a brand-new 3-element beam just ahead of those three witches — Carol, Edna and Hazel. We ain't had a hurricane around here for nigh onto 10 years. So GVZ belatedly goes modern again. (This is one case where outdoor plumbing is best.) And what happens? Bam, zowie, whee — Hellion Hazel turned my hair black again, what with watching what looked like my beam's death agonies. My hair even stood up on end, quite a trick considering that the baldies wore it all off years ago. Just when I was mentally framing an epitaph which said "Born in June, died in October," Hazel went away and bothered someone else. A big apple tree fell on the house, we had no power for three days, the food in the freezer went defunct, but who cared? The beam survived undamaged!

Guess I don't need that new book after all. For once I must have done it right!!!

## Strays

W4EUV wonders if there is any paint or coating that would keep woodpeckers from slowly disintegrating his beam pole!

— . . . —

K6BF, B. J. Kroger of Santa Barbara, Calif., who has kept a 100 per cent log for over thirty years, recently had his 20,000th QSO on 2 meters with K6HEC, Oxnard. Kroger has had 11 calls in four U S. districts, Nicaragua and Mexico.

**In this top rated rig  
TVI is sealed in with  
METEX Electronic Weatherstrip**

Viking Ranger

This inexpensive product will do the same for your own rigs. Follow the lead of Johnson and other high placed manufacturers.

For sealing your own rigs or any consumer, industrial or military equipment against RF leakage METEX Electronic Weatherstrip is highly effective and is a simple operation. It's made of highly resilient compressed knitted wire which comes in several forms to meet all normal requirements even where closure is of an uneven nature. Type TVI 20-S is easily applied to most rigs in the home workshop.

METEX Electronic Weatherstrip is the simplest and most inexpensive method for sealing in RF leakage yet devised. Try it. Results are amazing. Ham and industrial inquiries invited.

# GPR 90

**TECHNICAL MATERIEL CORPORATION**  
Mamaroneck, N. Y.

**World Above 50 Mc.**

(Continued from page 67)

open end, with coupling loops for injection and input. The line is tapped for a crystal-diode mixer. Item 4 is a wave-meter tuning from 300 to 1300 Mc., by W6RJS. Near it is a 1296-Mc. tripler (5) similar to one soon to appear in *QST*. It was built by W6DQJ, and it uses a 2C39A tube, which may be seen on the floor in front of it.

A converter for 1215 Mc. shown at (6) uses the r.f. assembly from an AN/TRC-5. It has two resonant circuits preceding the crystal mixer. Its local oscillator uses a 2C40. One stage of 30-Mc. i.f. amplification is included. It is the property of W6DQJ. The APS-13 (7) is useful as an i.f. system for u.h.f. or microwave work. W6DQJ uses its 30-Mc. i.f. with the converter described above.

In his other hand Don holds a complete transmitter and receiver for 1215 Mc. A local oscillator from a TPS-1 serves as a transmitter, its type 446A tube delivering about ½ watt. The receiver section has another 446 local oscillator feeding a crystal mixer. A cascode i.f. stage on 30 Mc. is link coupled to a TV i.f. strip modified for 6AK5 tubes. A single audio section is used for both receiver output and Heising modulator. The power supply for this station is shown between items (3) and (5).

At the right of the photograph is an APT-5, property of W6RJS. This jammer, a common item in the heyday of low-priced surplus gear, has a relatively high-powered oscillator tuning from about 300 to above 1200 Mc.

Demonstration of the gear included two-way communication by W6CFL and W6MMU, and considerable interest was generated that should provide company for W6CFL, W6DQJ, and W6NLZ, u.h.f. pioneers of the Los Angeles area.

**OES Notes**

**K2GAN, Murray Hill, N. J.** — Constructed chassis with 5 different overtone oscillator circuits, to permit comparisons that will determine their respective merits for use in 2-meter transmitters and converters. Also experimenting with crystal grinding.

**K2DYC, Phelps, N. Y.** — 50-Mc. transmitter similar to October, 1954, *QST*, about completed.

**W2ORA, Collingswood, N. J.** — Activity on 50 Mc. picking up steadily in the Philadelphia-to-Washington area, but little heard from the north. Will cooperate with interested 50-Mc. operators in early-morning schedules, beginning at 6:30 EDT. Should be attractive to those who are kept from operating in evening hours because of the threat of Channel 2 TVI.

Recently put in 50-Mc. crystal. This may be TVI solution for some who think Channel 2 TVI is impossible to correct. Much trouble may come from unwanted harmonics of 6- or 8-Mc. crystals falling in Channel 2, rather than from blocking by the 50-Mc. fundamental.

**W2UXP, Webster, N. Y.** — Several new stations expected soon on 50 and 220 Mc.

**W3PMG, Chinchilla, Pa.** — Small transmitter-receiver set-ups for 50, 144, 220 and 420 Mc. under construction for use by W3KX/3 in V.H.F. Party and Field Day.

**W3UQJ, York, Pa.** — New 2E26 rig running on 50.3 Mc. with 3-element array. Will soon have 829-B final. Skeds being run with W3OTC, Silver Spring, Md., on 6. Activity growing on 50 Mc., new stations including W3s OWW OCI ALN AXC and SST.

**W4HHK, Collierville, Tenn.** — Monitoring 50.1 Mc. daily with fix-tuned receiver. Six-meter rig with p.p. 6146s under construction. Also planning 220-Mc. exciter for 4X150 220-420 final already on hand. Double conversion with single crystal planned for 432-Mc. reception. Crystal on 42.5 Mc. is to be multiplied 9 times for injection at 382.5 Mc., converting the 432-436-Mc. range to 39.5 to 53.5 Mc. The 42.5-Mc. signal also beats with the latter range in a second mixer to produce an i.f. of 7 to 11 Mc. to be tuned on the HRO.

**W4KKK, Rome, Ga.** — Experimenting with 50-Mc. phase modulation, in attempt to reduce TVI in fringe-area reception of Channel 2 from Atlanta. Most of the TVI was of an audio nature with the a.m. rig, picture being unaffected except in immediate vicinity. Working W4AKX, Gadsden, Ala., on Six, 55 miles.

**W4UIW, Miami, Fla.** — Active stations on 144 Mc. include W4s RNV KQG UIW FLH and JZB, with more activity coming. [See report of reception of Miami area

# Just released...

## and they're waiting for you at Burghardt's

**Terrific Trade-Ins**—As liberal as anyone in the country ... and yours may be worth more at Burghardt's. Trade-ins usually cover down payment on your new gear.

**10% Down—Easy Terms**—10% down lets you "take it away." Up to 18 months to pay on balances over \$200. Burghardt's financing saves you money—adjusts terms to your budget. All time payments based on local bank rates. Full payment within 90 days cancels interest.

**Speedy Delivery—Personal Attention**—No order too large or small for personal attention. All inquiries acknowledged and orders processed day received.

**Satisfaction Guaranteed**  
or your money refunded  
after 10 day trial.

**HARVEY WELLS T-90 SUPER BANDMASTER**—Here, in one small package (only 12 $\frac{3}{8}$ " x 10 $\frac{1}{2}$ " x 6 $\frac{3}{4}$ ") is a complete 90 watt, band-switching transmitter for fixed or mobile operation • TVI suppressed • complete break-in keying or keying of just exciter stages • push-to-talk and receiver muting • antenna changeover relay • 90 watts CW • 75 watts phone. Factory assembled and tested, complete with tubes.  
**ONLY \$17.95 DOWN**  
**\$9.78 per month for 18 months.**

**ACPOWER SUPPLY FOR THE T-90**—Designed specifically for use with the T-90 for fixed station operation. Operates with nominal line voltage input of 115 AC, 60 cycle, single phase. May be used as a separate supply for other equipment. Filament and relay voltages may be dropped to 6.3 volts with external resistors.  
**ONLY \$7.95 DOWN**  
**\$6.32 per month for 12 months.**

**HARVEY WELLS R-9 RECEIVER**—The perfect companion unit to the T-90, this highly stable, all-band receiver has a number of features never offered in such a compact rig before. Double conversion on all bands • all coils slug tuned, providing high "Q" circuits • separate oscillator coils for each band. Complete with tubes and built-in AC power supply.  
**ONLY \$14.95 DOWN**  
**\$8.14 per month for 18 months.**

**VIBRATOR POWER SUPPLY FOR THE R-9**—Designed to power the R-9 receiver for mobile operation, the VPS-R9 will operate with either 6 or 12 volts DC. Complete with shielded cable and connector.  
**ONLY \$28.50 COMPLETE**

**HAMMARLUND PRO-310 RECEIVER**—New from top to bottom, the Pro-310 features outstanding advancements in circuitry and mechanical design. Covers 550 kc to 35.52 mc • exceptional stability • high image rejection on all 6 bands • double conversion on top 4 • exalted BFO and sharp selectivity built-in for SSB operation. Bandspeed continuously calibrated over the entire range.  
**ONLY \$59.50 DOWN**  
**\$24.99 per month for 24 months.**  
Matching speaker available soon

**HAMMARLUND HQ-140-X RECEIVER**—A top quality communications receiver for the commercial or amateur radio operator, as well as the SWL. Frequency coverage is continuously tunable from 540 kc to 31 mc. • patented crystal filter provides extreme selectivity to attenuate closely adjacent interfering signals • Unusually stable BFO • large, comfortable and conveniently positioned controls.  
**ONLY \$26.45 DOWN**  
**\$14.41 per month for 18 months. Matching speaker—\$14.50**

### TOP TRADE-INS!

Write for our latest bulletin. We have hundreds of standard brand pieces of equipment in our trade-in department—used equipment made by Johnson, National, Collins, Hallcrafters, Gonset, Elmac, Harvey-Wells, Morrow, Central Electronics, and other leading names.

Our prices on trade-ins are realistic and down to earth. In addition where purchase is for cash with no trade-in, an additional 10% discount is allowed. Burghardt's financing plan tailored to your budget can be used for the purchase of new as well as used equipment.

73,

Stan Burghardt WJBV

**ALL TRUE  
AND  
STRONGER  
TOO!**

stations in North Carolina elsewhere in this month's copy — E. P. T.J. W4LXZ ready to go on 420; W4UIW getting set.

**W5FPB, Albuquerque, N. Mex.** — Albuquerque V.H.F. Club organized officially, with 23 members present at first meeting, April 22nd. W5FAG now has high-powered c.w. rig on 144 Mc. and is looking for DX skeds. Several West Coast stations, W7VMP or Phoenix, Ariz., and W7s FGG and UPF of Tucson, are already cooperating. Frequencies: W7VMP — 144.0165; W7FGG and W7UPF — 144.126 Mc.

**W5SCX, Ardmore, Okla.** — AF MARS net meets each Sunday morning at 0700 on 143.99 Mc. for propagation check. W5AXY, Austin, Texas, NCS, was \$9-plus over 300-mile path, May 1st.

**W6ORS, Alhambra, Cal.** — New club, San Bernadino Microwave Society, meets at home of W6VIX, Ontario. All interested in "a.c. bands" are invited.

**W7TMU, Snohomish, Wash.** — New activity developing on 50 Mc. since appearance of Technicians, April 12th. Now have 11 stations using the band locally, with more to come. Activity on 144 Mc. dropped, it is hoped temporarily, as a result of polarization controversy.

**W7UKI, Marysville, Wash.** — Experimenting with 1N34 crystal mixer, heard W7TMU, 15 miles away, while using only indoor folded dipole. Believe it would make a satisfactory converter if used with good r.f. amplifier and crystal-controlled injection.

**W7YJE, Seattle, Wash.** — First good 50-Mc. opening of the season, May 14th. W7s PRW UFE and DYD worked around 10 stations each in Southern California. Local 6-meter gang check band nightly at 1900 PST.

**W8HCD, Dayton, Ohio** — Six-meter band used locally principally for contests. Activity otherwise is low because of Channel 2 trouble. Have been able to put out up to 10 watts without TVI, using either c.w. or f.m. Amplitude modulation increases TVI potential greatly.

New 32-element 144-Mc. array at 50 feet above ground outperforming old 5-over-5 (at 40 feet) beyond description.

Use of 420-Mc. band picking up to point where contacts can be made occasionally without prior arrangement on another band. Working on flying-spot scanner, having experienced trouble getting 5527 to work. Would like to hear from TV enthusiasts regarding results with 5527.

**W9LEE, Westboro, Wisc.** — Skeds with W9LVJ, Waukesha, 175 miles, 0730 and 1900 CST, 144.18 Mc., and W9BBN, Grand Marais, Minn., 190 miles, 0745, 144.13 Mc., now running close to 100 per cent successful since coming of warmer weather.

**W9UDD, Ft. Wayne, Ind.** — Local gang busy modifying former police and fire receivers for 2490 and 1634 kc. for use with 50-Mc. converters in local mobile net formerly on 29.62 Mc. Converter to have 6BQ7 g.g. r.f. stage and mixer with 6J6 oscillator-doubler. Aiming for simplest possible construction.

**W9QMF, Perryville, Mo.** — New 12-element long Yagi erected for 144 Mc., to compare results with former 5-over-5.

**W9RSP, Marvin, S. Dak.** — Skeds on 144 Mc. with W9HXY, St. Cloud, Minn., 170 miles, highly successful. W9LEE and W9DSP, 400 miles, worked occasionally.

## YL News & Views

(Continued from page 55)

— another multiplier — I couldn't give up W9CXY. An hour later the burning odor persisted. Not my transmitter, I happily thought. Then — oh no — our dinner! Must save it and our once happy home. Wonder if I can keep the rig when our divorce is final? Our dinner looked and tasted like a prehistoric man dug from the peat bogs. There was no conversation.

But I wouldn't have missed it — not even for a kilowatt with a charmed maintenance life and proper voltages on the oscillator. Take it from a seven year 'phone gal, c.w. is here to stay and contests are a very pleasant form of mayhem.

The finishing touch to Merle's first c.w. contest

(Continued on page 136)

# new SELF-SUPPORTING LAY-OVER TOWER

## PREMAX

## "CA" BUMPER MOUNTING FITS ANY CAR

**Mount Your Mobile Antenna without Drilling or Marring!**

Even the massive bumpers of new 1955 cars can be outfitted with Premax's newly improved "CA" mobile antenna mounting, *without* spoiling chrome finish. Mounting includes extra chain links and braided copper wire ground lead. Ask your dealer for the "CA", or write,

Division  
Chisholm-Ryder Co., Inc.

**PREMAX PRODUCTS**

5582 Highland Avenue, Niagara Falls, New York

## Here's Why!

There's no drilling or damage to Bumper or splash-pan necessary. "CA" Bumper Mounting is fully adjustable with 9 links of chain. Add or remove links as needed!

# VALPEY

## Quartz Crystals

symbol of craftsmanship  
for over 23 years

Valpey measures each crystal for surface flatness using a Precision Optical Flat with monochromatic light in a Valpey-designed Interferometer. Parallelism and surface flatness are measured to millionths of an inch — another step in the Valpey quality control process.

Manufacturers of ultrasonic transducers and delay lines are assured the ultimate in equipment performance when they specify Valpey. For experimental labs or production runs, Valpey is equipped to provide crystals to 60 Mc., meeting the most rigid specifications.

STRATFORD

NEW JERSEY

attempt was notification by the YLRL that she had placed second highest in the OM c.w. portion of the contest! Her rightful conclusion: Merle is a name common to both sexes and contest checkers tossed her log on the OM's pile.

### Keeping Up with the Girls

Congratulations to W1ZJE, Lillian Salter, who completed her 25th year with the ARRL Communications Department on May 12th. . . . W2JZX has resigned as PAM, OPS, and OBS and will be off the air while she moves from Long Island to New York City. K2IWO, Hilda, will take over for Vi as Second District Chairman for the YLRL until the end of her current term, July 1st. . . . W3s LGY, HPP, HUX, and KL7BHE/W8 attended the Doghouse Net picnic in May at Columbus, Ohio. . . . W4BLR, Kay, made BPL for April. . . . W8NNH's contacts with EA8BF, Canary Islands and GD3IBL, Isle of Man, have spurred her on to more DX hunting. . . . KZ5DG has 100 countries confirmed on 'phone on 15 meters. Grace became the first station in the western hemisphere to contact Gambia on 15 meters when she worked ZD3BFC in March (only station in that country on that band). When FM7WN put Martinique on the 15-meter band in April, Grace was his first contact. . . . WN0AYQ, of Ladue, Mo., can be numbered among the younger YLs — Bonnie is 8 years old. . . . On April 23rd, the Chicago unit of the YLRL celebrated its second anniversary with an open house at its club rooms. One hundred fifty guests heard speeches by OM's W9s LLX, LZ, HPG, YIX and representatives of nearby radio companies. . . . Mrs. Lillian Root, Chairman of Women's Activities for the Dayton Hamvention reported 146 YLs and XYLs in attendance at the popular Ohio affair. . . . While newspaper men visited VE6MP, Maude demonstrated ham radio by making a 5/9 contact with W1MCW, Lou.

### YLs You May Have Worked

Mary G. Livingston, "Marian," W5EYE, was chosen "Operator of the Month" (December, 1954) of the Fourth Army Area. She received an Army MARS certificate in recognition of her outstanding assistance

to the MARS program. Marian averages 65 hours per month on scheduled MARS nets and handles an average of 80 messages during that period. Her favorite bands are 75 and 40 c.w. She is particularly interested in antenna experimentation. Her OM is W5KXJ, and there are four jr. ops at their Sheldon, Texas, QTH.

# 1 KW PI-NETWORK TANK COIL With Full Bandswitching ALL IN ONE COMPACT UNIT

Here's an integral high-power bandswitching pi-network tank coil for maximum efficiency operation from 80 through 10 meters. Designed for class "C" or linear operation using triodes or tetrodes in conventional or grounded grid circuits, Model 850 lets you easily select the desired operating band through its positive-acting, high-current, r-f switch. Stepped sectional coil windings, of extra heavy conductor at the higher frequencies, provide ample current carrying capacity and a minimum "Q" of 300 over the entire operating range. Quality construction throughout assures long life and an extra margin of safety. See this bandswitching inductor at your nearest B&W distributor. Or, write for Bulletin 850.

## MODEL 850

Output Impedance: 50 to 75 ohms.

Input: 1 kw with plate voltages from 2500 to 3000 volts d-c.

Price: \$35.00 Amateur Net.

## for HIGH POWER PI NETWORKS

### VACUUM VARIABLES 10 KV . . . 10-400 MMF

A beautiful, brand new, Jennings Vacuum Variable offered at half price as a result of a fortunate contract cancellation procurement. This is an ELMAR exclusive. See our QST ad for November 1954, page 143.

### B-W'S BRAND NEW MULTI-BAND INDUCTOR

an all-band inductor with KW rating for pi networks. Built around a real heavy-duty switch. Lowest losses, (minimum Q of 300 for all bands) fastest band change. Size, including switch, no larger than older style roller coils . . .

. . . EFFECTIVE . . . EFFICIENT.

Immediate attention to mail orders for the above or any other nationally advertised electronic parts and equipment. ELMAR can supply, from STOCK, almost anything you may require.

### HIGH EFFICIENCY BASE LOADING FOR MOBILE WHIPS!

The "Whipload 6" provides high efficiency base loading for mobile whips with instant bandswitch selection of six amateur bands: 75, 40, 20, 15, 11 and 10 meters. On 75 meters a special capacitor with dial scale permits tuning entire band. Covers other bands without tuning. Air-wound coil provides extremely high "Q". Fibre glass housing protects assembly. Mounts on standard mobile whip.

## QST — Vol. IV

(Continued from page 58)

### (b) Broadcasting:

Melba (famous opera and concert star) sang over the Marconi radiophone station in Chelmsford, England.<sup>38</sup>

The De Forest Company began sending out nightly news-service, on 1,650 meters, with a 1-kw. radiophone located on top of the World's Tower Building, New York City.<sup>39</sup>

The Naval Communications Service broadcast a concert given by Mme. Tettrazini. This originated in her apartment at the McAlpin Hotel (in New York City), and was sent, via Bell Telephone, to the Naval Communication Service's station at 44 Whitehall St.<sup>40</sup>

In "Strays," the following appeared, on page 47 of the February, 1921, issue: "Wondering who KDKA is? Westinghouse Elec. & Mfg. Co., East Pittsburgh, 375 meters."

Later, in 1921, a church in Pittsburgh made a practice of picking up KDKA's church service broadcast each Sunday and delivering it to the parishioners via a loudspeaker installed in the pulpit.<sup>41</sup>

### (c) Ship-to-shore radiotelephone:

Green Harbor, Massachusetts (1XD) began experiments with the "KQ" Boats.<sup>42</sup>

A.T.&T. "bought into" the R.C.A.<sup>43</sup>

Near Jacksonville, Florida, the Lybeck Ocean Harvester Co. installed a radiophone on one of its fishing craft, and began experimental contacts with shore on 350 meters.<sup>44</sup>

### (d) "Firsts" or "Near-Firsts":

The QSL card for use in reporting amateur signals over distances of 500 miles was first suggested.<sup>45</sup>

A radiotelephone mounted in an automobile, was exhibited (by SDR) at the annual outing of the Radio Engineering Society of Pittsburgh, held on July 18, 1920.<sup>46</sup>

At station 4BQ (Rome, Georgia), an arrangement whereby a telephone line could be connected to a radio receiver was in operation. It was used to distribute distant radio concerts to friends.<sup>47</sup>

The May, 1921, issue of QST contained the first intimation that the League would like to publish a "Handbook" of its own: ". . . One of the things we want to do is to publish a real textbook on radio; a book different from any other

## EASY TO LEARN CODE

It is easy and pleasant to learn or increase speed the modern way — with an **Instructograph Code Teacher**. Excellent for the beginner or advanced student. A quick, practical and dependable method. Available tapes from beginner's alphabet to typical messages on all subjects. Speed range 5 to 40 WPM. Always ready, no QRM, beats having someone send to you.

### ENDORSED BY THOUSANDS!

The **Instructograph Code Teacher** literally takes the place of an operator-instructor and enables anyone to learn and master code without further assistance. Thousands of successful operators have "acquired the code" with the **Instructograph System**. Write today for full particulars and convenient rental plans.

## INSTRUCTOGRAPH COMPANY

4709 SHERIDAN ROAD, CHICAGO 40, ILLINOIS

one now in existence, dealing with the basic theory of amateur radio in a way that will give every amateur operator a clear theoretical understanding of how his apparatus functions so that he may experiment intelligently and not haphazardly; and a book that will likewise serve as a text for the non-technically trained individuals who in increasing numbers are taking up the study of Citizen Wireless." <sup>48</sup>

(e) "Curiosities":

The editor of *QST* announced that he had on hand enough "Calls Heard" lists submitted by amateurs to fill several thousand pages of the magazine. <sup>49</sup>

Station 9ZN covered the Moran-Leonard fight, at East Chicago (20 miles from the "windy city") with a De Forest radiophone and a portable ¼-kw. radiotelegraph spark transmitter. This was done for the Chicago "Herald Examiner". <sup>50</sup>

Arthur W. S. Davis (1LD, of Lowell, Massachusetts), an elderly amateur, had his radio station moved into his sick room, during his last illness; and he "worked it" almost up to the last minute of his life. <sup>51</sup>

Radio 8ZW purchased 550-Volt D.C., for his c.w. set from the trolley company for 50¢ per month. <sup>52</sup>

At radio 6WN (San Diego, California), a 5-step amplifier allowed the signals of 6MZ (Del Mar, California) to be read by *sense of touch*. <sup>53</sup>

In this "Foreword" I have been able to mention only the "high-spots" of this remarkably interesting Volume of the magazine. An examination of the Index itself will "fill in the details." "All-in-all," Volume IV merits plenty of attention.

— S.B.Y., WØCO

Rural Route 3, Box 94,  
Wayzata, Minnesota,  
July 12, 1953.

Part II of WØCO's index to Volume IV of *QST* will appear in a subsequent issue. — Ed.

<sup>48</sup> 28, May 1921. ("Our Bonds").

<sup>49</sup> 54, August 1920.

<sup>50</sup> 48, December 1920.

<sup>51</sup> 49, March 1921.

<sup>52</sup> 44, April 1921.

<sup>53</sup> 51, May 1921.

## Strays

Articles published in *QST* invariably bring the authors considerable mail from readers desiring clarification or amplification on certain points. While such interest is always welcomed, authors are often hard put to handle such correspondence in volume. To expedite replies, readers should: 1) enclose stamped self-addressed envelopes; 2) when using club stationery include the secretary's address; 3) sign correspondence with full names and mailing addresses in addition to call signs; and 4) stress legibility when handwriting.

## BANTAM 65

THE SMALLEST, MOST COMPACT  
MOBILE TRANSMITTER WITH  
65 W—PHONE • 90W—CW

### MOBILE POWER SUPPLIES

#### Model 606-6V Kit

500V DC 225 Ma.; no battery drain on standby; instant start, stop—no waiting; communications type Vibrator; size 6 x 7 x 6 $\frac{1}{2}$  in., mtg. plate, 6 x 9. Small and rugged.

Shipping weight, 14 lbs. .... \$29.50  
(Factory wired, \$7.50 extra)

Model 612-12V Kit. .... \$33.50  
(Factory wired, \$7.50 extra)

#### Model 6A

Complete power supply; 6 Volt input; output power selector sw.—Pos. #1, 500 V 225 Ma.—Pos. #2, 400 V 170 Ma.; built-in relay for remote control; On-Off sw for local control; 700 Volt filter condensers; extra heavy duty Vibrator. . . \$39.50

Model 6115 AC Power Supply—to operate Bantam 65 as a fixed station. .... \$39.50

Model PTH Top Hat—will improve the efficiency of any mobile whip. .... \$2.50

Model 6144 2-Meter Phone and CW Transmitter  
Price and delivery to be announced.

The Palco Bantam 65 is highly compact—4" high, 8" wide, 8 $\frac{3}{4}$ " deep—allowing for maximum leg room. It employs a separate modulator section on a chassis 2" x 2 $\frac{1}{8}$ " x 11" that may be mounted wherever convenient. In addition, the Bantam 65 offers such outstanding features as . . .

- Built-in VFO with 2 crystal positions
- Filament input either 6 or 12 Volts; plate supply requirement 600 Volt max. @ 250 Ma.
- Band switching—6 bands
- VFO and exciter stages are ganged-tuned
- Pi-Section output
- Built-in antenna change-over and receiver silencing relay
- Separate input for high impedance and carbon microphone
- Break-in operation on CW
- AB<sub>1</sub> modulation employing netagive peak clipping

BANTAM 65, complete with tubes and power connectors. . . \$159.50

## Correspondence

(Continued from page 49)

were saying they would have found that they were mostly foreign commercials. . . .

— C. J. Haas, W0BLI

## IDENTIFIED

9835 Calumet Ave.  
Chicago 28, Ill.

Editor, QST:

I'll bet you a wooden nickel I can identify the "unlicensed" station "DA" mentioned on page 50 of March QST. That has been so long ago I won't have to take refuge under the Fifth Amendment.

I believe this was a rig using 4 Navy VTIs and using B batteries for plate voltage.

To my personal knowledge this transmitter was used at Seagate—old WST-NAH7—with regular station antenna, but I believe it was also used at several other locations around Brooklyn and New York City. . . .

— Levin J. Peck, W9FAW

## LISTENER REPORTS

RCAF Station Gander  
Gander, Nfld.

Editor, QST:

. . . Financially, SWL QSLs are embarrassing. If I had replied to all the QSLs and letters that I've received from SWLs since going high power (for Canada at any rate) I'd have had to spend 4¢ per card as well as 4¢ for mailing that card, and for the SWL cards that I've received without the International Reply Coupons alone, it would have cost me \$38.04. Now I ask you—is that fair?

— A. Velleman, VO2AW

U. S. Naval Air Station  
Box 12, c/o FPO  
San Francisco, Calif.

Editor, QST:

. . . Being a KG6 SWL I spend a good part of my tin e listening in on 20 meters out here in Guam.

After spending a few hours drawing up a card with the help of a local ham, and a few more photographing and printing the cards up, I was in business. After listening to so many stations saying they QSL 100 per cent I thought that I would do pretty good, so started mailing out the cards. All the cards go airmail and it must not be local stuff as most of them cost me twenty five cents airmail. Also enclosed are the proper amount of International Reply Coupons. I have a few hundred dollars worth of radio to SWL with and don't have too much trouble hearing stations all over the world.

What I would like to know is the secret to get some QSL cards in return. After a few months of trying I have received one from a W6 and one from a PY2. Haven't given up trying as I sent out 15 more this morning.

— Robert H. Davis, HM1, USN

## NOR THIS WAY

3804 Rexmere Rd.  
Baltimore 18, Md.

Editor, QST:

. . . I wonder if Mr. Proetz (May QST, p. 54) can give me an answer for the following? On May 6, 1952, at 6:25 p.m. EST, I worked VQ2DT, Dave R. Taylor of Kitwe, Northern Rhodesia. I sent a QSL to him that same day followed at decent intervals by others, then a letter. No answer to any of them. Then on March 6, 1953, I sent another letter containing five International Reply Coupons. I still have not received his QSL. On January 6, 1952, at 3:25 p.m. EST, contacted VQ3CP, J. A. Doxsey of Mwanza, Tanganyika. QSL card sent that day and subsequent ones, also a letter, but no reply. March 6, 1953, I sent him an airmail letter containing five International Reply Coupons, but to date I have no QSL from him. The same situation prevailed with VQ4ERR of Nairobi, Kenya.

Doesn't Mr. Proetz realize that QSL cards are required by ARRL and other organizations for purposes of verification when certain certificates are applied for? And may I

**Q-max**  
**A-27**

**LOW-LOSS LACQUER & CEMENT**

• Q-Max provides a clear, practically loss-free covering, penetrates deeply to seal out moisture, imparts rigidity and promotes electrical stability. Does not appreciably alter the "Q" of R-F coils.

• Q-Max is easy to apply, dries quickly, adheres to practically all materials, has a wide temperature range and acts as a mild flux on tinned surfaces.

In 1, 5 and 55 gallon containers.

*Communication Products Company, Inc.*

MARLBORO, NEW JERSEY  
(MONMOUTH COUNTY)  
Telephone: FReehold 8-1880

remind him to look on page 76 of the April 1955 *QST* and he'll see listed in the DXCC Honor Roll the call of VQ4ERR with 226 countries. How did he get it? By receiving QSL cards so he could send them to ARRL for verification, that's how! . . .

— Arthur W. Plummer, W3EQK

**PHENOMENON**

Jefferson City  
Missouri

Editor, *QST*:

. . . On an average of one night every three or four months during the period of the new moon at about midnight there is an echo on signals in the 2800-kc. region. A number of us on the Missouri State Highway Patrol c.w. net on this band have noticed the effect and no two agree on the cause. Our c.w. receivers are wired for full break-in, and on the nights in question, the operator can hear his own transmitted signal with a strength of about S8 and a delay of up to about 2 seconds.

The only details I can supply are these: The effect is usually first noticed about midnight at the station at St. Joseph, and here in Jefferson City anywhere from 30 minutes to 2 hours later. It seems to move in a southeasterly direction, usually observed at Poplar Bluff a half hour later than here. Some nights only one or two stations will notice the effect, but once, about three years ago, all of the Missouri stations heard it. The echo is never heard by any but the transmitting station. The duration of the effect varies from about 5 minutes to an hour.

Normally, on something like this, the cause might be attributed to too much "cough medicine," but with old-timers like W0BNQ, W5BML, W0KNG, W0RTG, W0ZAO, and a few others to vouch for me, I feel that someone else has probably noticed it too. Anyone want to volunteer a good explanation?

— Davis A. Helton, W0PME

**WHY SINES?**

5704 Ben Alder  
Whittier, Calif.

Editor, *QST*:

Just finished reading "YB's" letter in the April issue of *QST* (page 52) and would like to add my two-bits to his.

Having worked as railroad telegrapher and train dispatcher for 27 years I agree with "YB" that we should receipt for messages with our "sine," but it is nice, when just rag-chewing, to know the other fellow's name.

— J. E. Muncey, W6HUI

1178 High Street  
Central Falls, R. I.

Editor, *QST*:

. . . Well, "YB," I tried your system on c.w., but I must say it doesn't fare too well! I used "PB" instead of "Paul" for a sine, and 7 out of 10 replied, without fail, ". . . NAME OM? PSE RPT NAME OM" or better still, "CFM NAME PB IMI IMI." I got sick of this and went back to my old stand-by, P-A-U-L, and nobody ventured a query. When one comes right down to it, if W7OE ever gave me "YB" for his name, I'd query quite a bit also. So, Howard, we are not all telegraph office operators and I'm afraid legible names will have to be used if we want to save gray hairs! The initial "sine" system has some value, though — don't throw it out yet! Of most practical use would be on NTS — our ARRL c.w. traffic nets, where the use of names is totally unnecessary. But then, the call is sufficient so why bother with sines at all?

— Paul B. Boivin, jr., W1ZXA

# HAM-ADS

(1) Advertising shall pertain to radio and shall be of nature of interest to radio amateurs or experimenters in their pursuit of the art.

(2) No display of any character will be accepted, nor can any special typographical arrangement, such as all or part capital letters be used which would tend to make one advertisement stand out from the others. No Box Reply Service can be maintained in these columns.

(3) The Ham-Ad rate is 30¢ per word, except as noted in paragraph (6) below.

(4) Remittance in full must accompany copy. No cash or contract discount or agency commission will be allowed.

(5) Closing date for Ham-Ads is the 20th of the second month preceding publication date.

(6) A special rate of 7¢ per word will apply to advertising which, in our judgment, is obviously non-commercial in nature, and is placed and signed by a member of the American Radio Relay League. Thus, advertising of bona fide surplus equipment owned, used and sold by an individual or apparatus offered for exchange or advertising inquiring for special equipment, if by a member of the American Radio Relay League take the 7¢ rate. An attempt to deal in apparatus in quantity for profit, even if by an individual, is commercial and all advertising by him takes the 30¢ rate. Provisions of paragraphs (1), (2) and (5), apply to all advertising in this column regardless of which rate may apply. To expedite handling of your copy please state whether you are a member of ARRL.

(7) Because error is more easily avoided, it is requested signature and address be printed plainly. Typewritten copy preferred, but handwritten signature must accompany all authorized insertions.

(8) No advertiser may use more than 100 words in any one issue nor more than one ad in one issue.

*Having made no investigation of the advertisers in the classified columns, the publishers of QST are unable to vouch for their integrity or for the grade or character of the products or services advertised.*

TRADE: Argus C-4, 35 mm camera, 2.8 lens, flashgun, leather carrying case, all new and in original carton and Hallicrafters S20R revr in gud condx for Hammarlund HQ-129X in A-1 condx. K4BGG, Joe S. White, 5892 Lemon Ave., Long Beach, Calif.

FOR Sale: Collins exciter 310B-1, coils, instruction book, \$185; frequency meter BC-221-N, spare tubes, crystal, AC power supply, \$60. A excellent. R. C. Litter, W8JRG, 640 Snowhill Blvd., Springfield, Ohio.

MARINE crystals, new, guaranteed; heavy duty types. All channels in singles or sets. Specify frequencies and socket pin dimensions. Transmitting \$2.95, receiving \$2.50. C-W Crystals, Box 2065, El Monte, Calif.

A Steal! 4-element Q-Master 20-meter shortbeam, also for 11 meters, used 2 weeks. Cost \$120 plus. Sell for \$70. W2LEB, 13 Shepard Pl., Nutley, N. J. NU 2-7552.

NOVICES: TBS-50-D and power supply, in good condition, \$140. Ian Underwood, 265 Grace Church St., Rye, N. Y.

10A SSB exciter modified per November 1953 QST including 20-40-80 meter coils, two crystals, and QT-1. Excellent condition. Best offer F.o.b. New Orleans. Want QSTs before 1930. Wayne Cooper, YN1WC, 12 Calle 6-21, Guatemala City, C. A.

VERTICAL antenna for 20-40-80 M. All material and information included. \$59.50. No C.o.d. El Cajon Electronic Engineering, 720 S. Johnson Ave., El Cajon, Calif.

SELL: Receivers HQ-120X, \$75.00; National NSD100, general coverage, \$50; RME VHF2-11, \$65; Triband converter, \$25.00; transmitters TBS50C, \$65; Subraco MT15X, \$35.00; Elmac A54 speech and modulator modified, \$70. Two Link police car transmitters with dynamotors at \$40.00 each. Want: 75A3 or modified 75A2 with mechanical filter. Anybody able to hatch a deal with any of this? W2ADD, Paul Reveal, 129 Midland Ave., Glens Ridge, N. J.

WANTED: Micro-Match for 72 ohm coax and 75-100 watt Multi-match modulation transformer. Walden Holl, W3UDW, 538 Luzerne St., Johnstown, Penna.

VIKING 1, VFO, TVI-suppressed, S-40B, accessories: \$350. K2DQH, Chris Lane, North St., Harrison, N. Y.

FOR Sale: Complete Motorola T69-20A mobile 10-meter xmitter. Also Motorola fixed frequency receiver with converter. All controls, cables, everything from mike to antenna. \$100. Will consider separating. W9GBS, Schachte, 6020 N. Neva, Chicago 31, Ill.

COLLINS 32V-3 in excellent condition with 4D32 spare: \$450 F.o.b. Bristol, Conn. W1AYR, A. B. Nelson, 350 Fern Hill Rd., Bristol, Conn.

WSAXI/MM correct mailing QTH Arthur E. Hutchins, R/O SS Fullerton Hills, Bernuth Lembcke Co., 420 Lexington Ave., New York 17, N. Y.

## DEAR FELLOW AMATEUR:—

*"A very serious situation has arisen. Unless all of us amateurs act quickly, a law will be passed in Washington which will wipe Amateur Wireless completely out . . ."*

Thus in 1918 a four-year-old ARRL, already the guardian of amateur radio in regulatory matters, wrote each amateur in the United States, trying to prevent the extinction of "amateur wireless."

Wouldn't you be astounded to receive such an urgent call from ARRL today?

Certainly you would. Today, amateur radio is a strong, stable group, represented by a capable ARRL in battles to preserve amateur privileges. Such representation, backed by a united membership, alone has kept amateur radio on the air, contributing to the public good.

Are you doing your part? The first step is to take your place in the ranks of organized amateurs. Join the League today!

**QST and ARRL Membership**

90801

## The No. 90801 EXCITER-TRANSMITTER

The No. 90801 Exciter-Transmitter is of the most modern design including features and shielding for TVI reduction, band-switching for the 4-7-14-21 and 28 megacycle bands, circuit metering. Conservatively rated for use either as a transmitter or exciter. 5763 oscillator-buffer-multiplier and 6146 power amplifier. 90 watts input for CW. Can be keyed in the oscillator and/or amplifier or by means of keyed external V.F.O. such as the 90711. 67 watts input phone. Rack mounted 3½" panel height.

# 20 outstanding SSB signals

almost ready to come  
on the air

**MODEL  
500W.**

The chances are excellent that this group of twenty 500W units from the big Gonset production lines will give a fine account of themselves on the air. First, consider the many essential elements that make up any good linear . . . then . . . check the 500W. You'll find them ALL there, built-in, inherent! For example:

Excellent linearity on SSB or AM.

Complete stability, a freedom from oscillation, parasitic or otherwise . . .

Loadability . . . to any practical degree with pi network output into 35 to 300 ohms. (A big assist in tuning is provided by full switchable metering including . . . grid drive and an output RF voltmeter.)

Insurance against inadequate loading . . . a special, relay-actuated screen cutout circuit, interrupts screen voltage, protects tubes, continues to flash a panel light until improper underloaded condition is corrected.

Grid circuit is adequately pre-swamped.

Excitation control . . . permits precise excitation adjustment for AB<sub>1</sub> or AB<sub>3</sub> operation.

80 mfd., capacity . . . in filter of heavy-duty, (bridge) power supply gives excellent dynamic regulation.

Add . . . as highly desirable features . . . single knob bondswitching for 10-11-15-20-40-75-80 . . . (provision for extra bond, as 160) . . . low replacement cost tubes, (4-807's) . . . very low grid drive requirements on SSB, C.W., AM . . . precision parts and workmanship inside . . . and outside . . .

**SSB - 250 Watts Peak envelope power.**

**AM - 80-100 Watts Carrier**

**CW - 220-240 Watts Output**

**Net.... 339.00**

*"Look for me on  
your frequency"*

. . . a statement any Communicator owner can now make without sifting through his crystal stock.

GONSET 2 meter VFO brings complete diversification to your operation . . . brings added enjoyment in the form of more . . . better . . . QRM-free contacts . . . DX . . . C-D, CAP, nets or just friendly "Zeroing-in".

Does something else too. A built-in stage of audio pre-amplification provides extra audio gain for Communicators, permits "sit-back" operation of lower-level xtal mikes. Panel gain control also.

No installation problems . . . no soldering . . . no wiring changes needed. Plugs into Communicator like a crystal . . . flexible mating rear plugs link the two units . . . in seconds.

VFO output of 24 mcs., (can be used with other 2 meter equipment). Switch permits "zeroing" without carrier.

Calibrated dial tunable over some frequency range as Communicator . . . also usable as VFO for C.W. reception.

High stability. "Stays put" when received at stations using crystal converter front-ends into communications receivers.

A companion unit to  
your Communicator

An investment in operating enjoyment at **Net..... 84.50**

**GONSET CO.**

# NEW at ALLIED

## KNIGHT Low-Cost Test Instrument Kits

Lab Precision Quality...Easiest-to-Assemble Money-Saving Instruments

The greatest value anywhere for your test instrument dollar! Here's more for your money in accuracy, dependability, versatility and professional styling. Here's the last word in easy-to-build convenience. Instruction manuals are a marvel of simplicity for quick assembly without guesswork. You need only a screwdriver, soldering iron and pliers—and you're ready to build these top-quality instruments!

### New Knight Tube Tester Kit

Expertly engineered, low-cost tube tester. Tests 4, 5, 6 and 7-pin large, regular and miniature types, octals, loctals, 9-pin miniatures, pilot lamps. Tests cover new 600 ma. series-string types. Checks for emission, shorts, open elements, heater continuity.  $4\frac{1}{2}''$  meter with "Good-Replace" scale. Fast-operating roll chart. Universal socket pin selectors to test tubes with new base arrangements. Blank socket for future use. Choice of 14 fil. voltages from .75 to 117 v. Includes all parts, dark green metal case, gray panel, wire, solder.  $9 \times 4 \times 10''$ . For 110-120 v., 50-60 cy. AC. 14 lbs. **83 FX 143. Knight Tube Tester Kit. Only \$29.75**

**83 FX 142.** As above but in fabrikoid covered portable case,  $6\frac{1}{2} \times 14\frac{1}{2} \times 10\frac{1}{2}''$ . Shpg. wt., 15 lbs. Only **\$34.75**

**83 F 141.** TV Picture Tube Testing Adapter. Only **\$3.75**

### New Knight Signal Tracer Kit

Ideal for visual and audible signal tracing of RF, IF, video and audio circuits—at less than the cost of an audio signal tracer alone. Highest usable gain: "magic eye" with calibrated attenuators permits stage by stage gain measurements.  $4''$  PM speaker. With RF probe for checking all stages; includes audio probe tip. Noise test provision. Built-in wattmeter calibrated 25 to 1000 watts. With gray and green metal case ( $7 \times 10 \times 5''$ ), all parts, tubes, probes, precut leads, solder. For 105-125 v., 50-60 cy. AC. 13 lbs. **83 F 135. Knight Signal Tracer Kit. Only \$24.50**

### New Knight VOM Kit

Quality 20,000 ohm/volt VOM with  $4\frac{1}{2}''$  meter;  $\pm 2\%$  full scale accuracy; 1 $\times$  multipliers; single switch selects: 6 DC ranges—0.25-10-50-250-1000-5000 at 20,00 ohms/volt; 6 AC ranges—0.25-10-50-250-1000-5000 at 5000 ohms/volt; 3 resistance ranges—0-2000-200,000 ohms and 0-200 meg. 4 DC current ranges—0-10-100 ma. and 0-1-10 amps. Complete with bakelite case ( $6\frac{3}{4} \times 5\frac{1}{4} \times 3\frac{3}{4}''$ ), all parts, 4' test leads, batteries, wire and solder.

**83 F 140. Knight VOM Kit. Only \$26.50**

### New Knight RF Signal Generator Kit

Provides modulated or unmodulated RF output on long wave, broadcast, short wave, FM and TV frequencies. Ideal for use with VTVM for aligning RF and IF sections of radio and TV sets; use with sweep generator as TV marker generator. Delivers audio output for troubleshooting all audio stages. RF output: 160 kc to 110 mc on fundamentals; useful harmonic output to 220 mc; modulated at 400 cycles; with jack permitting modulation by external generator. Rated RF output 100,000 mv or greater. Max. audio output, 10 volts. Complete with green metal case ( $7 \times 10 \times 5''$ ) and gray panel, tubes, all parts, pre-wound coils, wire and solder. For 110-120 v., 50-60 cy. AC. 10 lbs. **83 F 145. Knight RF Signal Generator Kit. Only \$19.75**

### New Knight Audio Generator Kit

Ideal audio frequency source for checking audio circuits and speaker response; fine for Hi-Fi testing. Frequency range: 20 cps to 1 mc in 5 ranges. Output voltage: 10 volts to high imp.,  $\pm 1$  db to 200 kc. Generator imp., 600 ohms. Less than .25% distortion from 100 cps through the audible range; less than 1% when driving 600 ohm load at maximum output. Continuously variable step-attenuated output. Complete with green and gray metal case ( $8\frac{1}{2} \times 11 \times 7\frac{1}{2}''$ ), all parts, tubes, precut leads and solder. 17 lbs. **83 FX 137. Knight Audio Generator Kit. Only \$31.50**

# COMING

*the first receiver*

*in history evolved from a world-wide contest  
to find out WHAT HAMS WANT MOST!*

## National's

*Brand NEW*

# NC-300

## *dream receiver*

### Pre-view

*Just a FEW  
of the NC-300  
NEW*

### **Features:**

- longest slide rule dial ever—more than a foot long!
- Band Coverage: 160-1¼ meters. With 10 separate scales including National's exclusive converter provision for 6, 2 and 1¼ meters.
- No greater sensitivity in any receiver (3-6 db noise figure on all amateur bands.)
- Tuned to tomorrow—Styled to match.

### **COMBINING...**

**the most wanted features  
from thousands of "dream  
receiver" ideas submitted  
by hams themselves!**

It's well on the way to becoming a reality . . . a receiver including all the most wanted features submitted by thousands of amateur operators in National's world-wide DREAM RECEIVER Contest!

We've named it the NC-300—keep this name in mind. It will be at your ham equipment dealer's on NC-300 DAY. Stay tuned to your favorite ham magazine for the announcement of the date!

*tuned to tomorrow*

## National

NATIONAL COMPANY, INC.  
61 SHERMAN ST., MALDEN 48, MASS.

Inside the Gonset Type 500-W rf power amplifier. Note the 4 RCA-807's in parallel.

# LEADING AMATEUR DESIGNS

... Use *RCA Power Tubes*

Take Gonset's Model 500-W power amplifier, for example.

Solidly designed to meet the present and the future transmitter needs of progressive amateurs, this multi-purpose rf power amplifier is built to "deliver the goods"—using *four RCA-807's in parallel*.

Why is RCA the choice of both the commercial transmitter designer AND the amateur?

RCA power tubes are built to "take it." They are conservatively rated and reliable. They have great reserve of emission. They have "high

perveance" design—deliver high power output at lower plate voltages. RCA power tubes are **ECONOMICAL**.

RCA has a comprehensive line of high-perveance beam power tubes and triodes to meet every amateur power input requirement—up to a "gallon." They're available at your RCA Tube Distributor. For technical data, write RCA, Commercial Engineering, Section G-37-M, Harrison, N. J.

**RCA-807 Beam Power Tube.** Famous for its circuit versatility and popular price. In CW service, handles 75 watts input (ICAS) up to 60 Mc; 60 watts on phone—can be operated with reduced input to 125 Mc.

9% you operate 'phone YOU WON'T BE SATISFIED UNTIL YOU OWN

the completely new  
**664** VARIABLE D\*  
**CARDIOID**  
DYNAMIC MICROPHONE

**The 664 will equal a useful power increase of four times over commonly-used peaked microphones, and could well be the best investment, dollar-wise, in your shack**

Here is a totally new concept in microphones for amateur phone communication.

The cardioid (high directivity at all frequencies) pickup pattern enables you to have a *real* "arm chair QSO." The forward gain of 5 db\*\* allows you to speak at nearly twice the distance you have been working to a conventional microphone. Unwanted sounds in the shack are rejected nearly twice as effectively as by ordinarily-used non-directional microphones.

The response curve is tailored to put the highest degree of intelligibility on your carrier. Your 100% modulation is all speech . . . in full character . . . with bite and punch. This curve, compared to ordinary microphones, will give you up to 12 db more usable audio—without splatter or hash.

We invite you to prove to yourself that the 664 will outperform your present mike by a direct comparison. If it doesn't out-hurdle QRM, your distributor will refund the purchase price without qualification.

A peak in the response curve limits modulation to the peak value. A peak-free response brings the full power level to 100% modulation gaining an intelligibility increase equal to the peak in the average mike. The 664 is peak-free and gives the highest usable power of any microphone for AM, NFM and SSB.

New Variable D\* Dynamic Microphone operates on the principle of multiple sound paths to the diaphragm. Spaced apertures to the rear of the diaphragm are phased to provide cancellation of rear sounds and give full response to sound from the front.

This new principle enables the curve to be free from peaks or dips. Insures freedom of blasting and boominess from close talking. Eliminates effect from mechanical shock. High level -55 db. Acoustalloy diaphragm. Switch easily changed to relay control, if desired. Absolutely unaffected by moisture, humidity, or temperature.

Model 664, Without Stand.....Net Price: \$47.70  
Model 419, Desk Stand.....Net: 9.00

\*\*Forward gain is that compared to a pressure mike; actual front-to-back hemisphere pick-up ratio is 20 db.

\*Patent Pending

See your E-V Distributor,  
or write for Specification Sheet

**Electro-Voice®**  
ELECTRO-VOICE, INC. • BUCHANAN, MICH. • Export: 13 E. 40th St., N. Y. 1

● Right: the "why" of G-E "Operation Snow White". Unretouched micro-photograph of tube grid, shows a strand of lint which can easily cause an inter-electrode short-circuit. Dust particles have similar effect.

● Glass-paneled hoods for General Electric 5-Star Tube assembly and microscope inspection, assure working conditions of optimum cleanliness. Employees wear rubber finger cots,

to avoid contaminating tube parts with dirt or moisture. The entire "Snow White" area is air-conditioned and pressurized, and all garments are made of lint-free Nylon and Dacron.

## G-E "Operation Snow White" further increases 5-Star Tube high reliability!

Inoperatives among 5-Star Tubes have been cut two-thirds by measures G.E. has taken to provide lint-free, dust-free assembly and inspection. 100% 5-Star factory tests prove this gain in *built-in* tube dependability.

Most tube inoperatives are the result of intermittent "shorts" from lint and dust. G-E "Operation Snow White", by means of pressurized, filtered, and de-humidified air, plus numerous other steps to accent working cleanliness, cuts down on short-circuits at the source. Result: 5-Star Tubes are the most trust-

worthy types that you can install!

Use them in civil-defense work, where dependable communications are a "must"! Specially designed, built, and tested, they're your foremost protection against rig and receiver failures.

Your G-E tube distributor stocks 5-Star high-reliability tubes. See him for full information! *Tube Department, General Electric Co., Schenectady 5, N. Y.*

## —CONTENTS—

### TECHNICAL —

- An Improved Antenna Bridge  
R. Wade Caywood, W1KRD 11
- The Transistorized "Little Gem"  
E. Laird Campbell, W1CUT 16
- 807s in Parallel. . . . . Francis M. Yancey, K4CDO 18
- Power and Meter Facts in S.S.B. Operation  
Howard F. Wright, jr., W1PNB 21
- Portable Antennas for 50 and 144 Mc.  
Edward P. Tilton, W1HDQ 29
- A Six-Meter Club Project John P. Drummond, W3YHI 37
- The Viking Adventurer. . . . . (Recent Equipment) 39
- Models 650 and 651 Matchmasters  
(Recent Equipment) 40
- What About the Low-Frequency Harmonics?  
Charles L. Wood, W2VMX 42

### BEGINNER —

- One Tube — 80 and 40 Meters — 75 Watts  
Lewis G. McCoy, W1ICP 26

### MOBILE —

- The Automobile Storage Battery and Its Charging  
System. . . . . Donald H. Mix, W1TS 32
- Revision of 6-Volt Equipment for 12-Volt Operation. . . 36

### OPERATING —

- The Buffalo Area RACES Organization  
C. E. Johnson, jr., W2PPY 44

### GENERAL —

- ARRL at Operation Cue. . . . . George Hart, W1NJM 45
- QST — Volume IV. . . . . Sumner B. Young, W0CO 48

# why is the SX-96 the most wanted receiver on the air?

The Hallicrafters double conversion selectable side band receiver offers major improvements in stability by the addition of temperature compensation in the high frequency oscillator circuits and the use of crystal controlled second conversion oscillators. Hallicrafters highly selective 50 kc i-f system is used in this new precision-built receiver.

**Coverage:** Standard Broadcast, 538-1580 kc; Three S/W Bands, 1720 kc-34 Mc, Band 1: 538 kc-1580 kc-Band 2: 1720 kc-4.9 Mc-Band 3: 4.6 mc-13 mc-Band 4: 12 mc-34 mc.

**Type of Circuit:** Double conversion superheterodyne over the entire frequency range.

**Type of Signals:** AM-CW-SSB.

**Features:** Precision gear drives are used on both main tuning and band spread dials. Double conversion with selectable crystal controlled second oscillators. Selectable side band reception of both suppressed carrier and full carrier transmissions by front panel switch, delayed AVC, CW operation with AVC on or off. Calibrated bandspread, "S" meter, low drift, double conversion superhet.

**Controls:** Sensitivity, band selector, volume, tuning, AVC on/off, noise limiter on/off, AM/CW-SSB, Bandspread, selectivity, pitch control, response (pwr on/off, LSB, USB-2 tone pos.), receive-standby.

**Intermediate Frequencies:** 1650 kc and 50 kc.

**Tuning Assembly and Dial Drive Mechanism:** Separate 3 section tuning capacitor assemblies for main tuning and bandspread tuning. Circular main tuning dial has 0-100 logging scale. Bandspread dial is calibrated for the 80, 40, 20, 15, and 11-10 meter amateur bands.

**Selectivity:** Five steps of bandwidth calibration at 6 db points; 5 kc, 3 kc, 2 kc, 1 kc, and .5 kc.

**Antenna Input Impedance:** Balanced/unbalanced.

**Headphone Output Impedance:** Nominal 500 ohms.

**Audio Output Impedance:** 3.2/500 ohms.

**Automatic Noise Limiter:** Series noise limiter operated by toggle switch on front panel.

**Carrier Level Indicator:** Calibrated in "S" units from 1 to 9, decibels to 90 db over S9, microvolts from 1 to 1000 k.

**External Connections:** 3.2/500 ohm speaker terminals, terminals for single wire or doublet antenna, phono jack, AC power cord, socket for DC operation and remote control, audio output terminals, "S" meter electrical adjustment and mounting hole for co-axial cable connector. Phones jack on front panel.

**Audio Power Output:** 1.5 watts with 10% or less distortion.

**Power Supply:** 105/125 V, 50/60 cycle AC.

**CRYSTAL  
CONTROLLED  
BUT NOT  
"ROCK BOUND"**

Skip around as your heart desires . . . be a bandhopper with a vengeance . . . and yet retain the priceless advantages of crystal control. All you need is a half-dozen or more PRs. Multiple crystal operation is the answer to today's maddening QRM problems on phone or CW. It's most economical, too. See your jobber and select low-cost PRs from his all-frequencies stock. Be a gypsy on the band.

20 METERS, Type Z-3, \$3.95 • 40, 80 AND 160 METERS, Type Z-2, \$2.95

## Section Communications Managers of the ARRL Communications Department

**Reports Invited.** All amateurs, especially League members, are invited to report station activities on the first of each month (for preceding month) direct to the SCM, the administrative ARRL official elected by members in each Section. Radio club reports are also desired by SCMs for inclusion in *QST*. **ARRL Field Organization station appointments** are available in the areas shown to qualified League members. These include ORS, OES, OPS, OO and OBS. SCMs also desire applications for SEC, EC, RM and PAM where vacancies exist. *All amateurs* in the United States and Canada are invited to join the Amateur Radio Emergency Corps (ask for Form 7).

# THE AMERICAN RADIO RELAY LEAGUE, INC.,

is a noncommercial association of radio amateurs, bonded for the promotion of interest in amateur radio communication and experimentation, for the relaying of messages by radio, for the advancement of the radio art and of the public welfare, for the representation of the radio amateur in legislative matters, and for the maintenance of fraternalism and a high standard of conduct.

It is an incorporated association without capital stock, chartered under the laws of Connecticut. Its affairs are governed by a Board of Directors, elected every two years by the general membership. The officers are elected or appointed by the Directors. The League is noncommercial and no one commercially engaged in the manufacture, sale or rental of radio apparatus is eligible to membership on its board.

"Of, by and for the amateur," it numbers within its ranks practically every worth-while amateur in the nation and has a history of glorious achievement as the standard-bearer in amateur affairs.

Inquiries regarding membership are solicited. A bona fide interest in amateur radio is the only essential qualification; ownership of a transmitting station and knowledge of the code are not prerequisite, although full voting membership is granted only to licensed amateurs.

All general correspondence should be addressed to the administrative headquarters at West Hartford, Connecticut.

## Past Presidents

# "It Seems to Us..."

## ELECTIONS

Our frequent contention that amateurs are pretty much a cross-section of the population is borne out in yet another way by comparing the percentage of votes cast in ARRL director elections with those of national political elections. Over the past six U. S. Presidential elections the national vote has ranged from 51 to 62.7 per cent, while in the League's director elections the vote, in the past five years, has ranged nationally from 53 to 59 per cent, with some division votes as low as 48, and some as high as 65, per cent of those eligible. These figures show that, by and large, amateurs are as interested in the affairs of their organization as citizens generally are in national affairs. This, to us, is a sign of the strength of the organized amateur movement, and speaks well of amateurs as a group.

But curiosity moves us — what happens to the other forty per cent? Have they an active interest in League affairs? Do they realize that the ARRL directors are the people who make the long-range plans and decide policy matters for all League members? . . . that men of judgment and wisdom are needed? If they did, it would seem that the vote would be nearly 100 per cent, for all would be anxious to choose the man they believe most qualified for the director position.

The usual reasons why one may not be able to cast a ballot in a political election don't often operate in League elections. Transportation to the polls is no problem — the ballot-box is your mail box. The difficulty in obtaining absentee ballots doesn't apply — all our votes are "absentee." Temporary absence from town on business won't stymie you — the voting goes on continuously from October first to November twentieth.

One more thing is important — you can't vote for the man you think best if his name isn't on the ballot! Don't leave it to someone else — if you have someone in mind you believe has the qualities and qualifications of directorship, get up a nominating petition signed by ten or more Full Members, and send it into the Secretary before the 20th of September.

Let's make a new record for participation in this autumn's election in the Atlantic, Canadian, Dakota, Delta, Great Lakes, Midwest, Pacific and Southeastern Divisions. Full details are on page 50.

## MOBILE MANUAL

League Hq. takes pleasure in announcing the preparation of a new publication, *The Mobile Manual for Radio Amateurs*, another addition to the ARRL Radio Amateur's Library. Now printing, it will be available sometime in August.

Like its slightly older brother, *Single Sideband*, the mobile manual is another demonstration of the thorough coverage *QST* provides in a specialized field, in this case mobile — for nearly all the material has come from the pages of our monthly journal over the past few years. The result is what you might expect — a veritable encyclopedia on mobile techniques — design, construction, installation and operation.

## Q-R-MARY

One of the most important and useful tools of the voice operator is phonetics. When conditions are rough and readability is poor, the use of phonetics can be the difference between communication and no communication. It seems to us, however, that sometimes we carry it to extreme.

In identifying your call sign, by all means use phonetics — anytime. But when a 'phone signal is Readability 5 (and except in DX, whoever heard a lesser report?) the only other reason to use phonetics is something like transmitting a trick word, or the address of a message. Yet you've heard many an R5 voice saying, ". . . here in Schenectady, S-Susan, C-Charlie, H-Henry. . . ." Or it might be Philadelphia or Detroit, Springfield or Milwaukee. Or simple operator names like Joe and Bill. There's no need for such phonetics unless your name is Zzyynsklf or unless you live in Bfftsplk Park.

Queen-Roger-Mary and Queen-Tare-Charlie are other cases in point. It has always been a source of amazement that so many of us

install a modulator for the enjoyment of voice communication, and then continue to use abbreviation methods which were designed for telegraphy and never would have come into existence without their need in telegraphing. "QRM" is for the c.w. operator, to save his time in otherwise having to spell out "interference." Voice frees the operator from the need for such abbreviations. 'Phone is much too useful a system of communication to be burdened with techniques designed for an entirely different mode. Say it with words!

## A.R.R.L. ROANOKE DIVISION CONVENTION

*Old Point Comfort, Va. — August 12th, 13th and 14th*

The ARRL Roanoke Division Convention is jointly sponsored this year by the Peninsula Amateur Radio Club and the Tidewater Mobile Radio Club. Convention Hq. will be the Chamberlin Hotel, Old Point Comfort, Virginia. Registration will begin Friday at 5 P.M., followed by a general get-together and dancing in the exclusive private Chamberlin Room Club. On Saturday there will be outstanding speakers on single sideband, antennas, and other subjects. There will be forums on 'phone and c.w. nets, DX round-up, single sideband, MARS, Navy, TVI, RACES and AREC. At the banquet there will be no long speeches but lots of entertainment.

For those who have small children, the hotel will place cots in your room at no additional cost. There will be special programs for children under supervision of trained personnel; also a private dining room for the children during the banquet so that you may be free to enjoy your meal. We hope to have baby sitters that may be employed at the prevailing rates to free you for an evening of dancing.

There will be trips for the ladies to Williamsburg, Jamestown, and Yorktown. A salt-water outdoor pool and a beach are available on the hotel grounds.

Registration fees as follows: full convention privileges, including banquet and dancing, \$6.00; Novices under 20 years of age, \$4.00. There is a special rate of \$10.00 for the OM and XYL. Hotel rates, \$5.00 single, \$8.00 double, and up.

The convention committee feels that you will enjoy and long remember your stay at this wonderful hotel and its Southern hospitality, with its wonderful food, outdoor salt-water pool, beautiful rooms and views overlooking Chesapeake Bay and Hampton Roads.

Reservations should be sent to Jefferson H. Walker, W4AAD, 27 River Road, Warwick, Va.

Hotel reservations should be sent to The Chamberlin Hotel, Old Point Comfort, Va.

### COMING A.R.R.L. CONVENTIONS

**August 12th-14th — Roanoke Division,  
Old Point Comfort, Va.**

**September 3rd-4th — South Dakota  
State, Yankton, S. D.**

**September 30th-October 1st-2nd —  
Southwestern Division Convention,  
San Diego, Calif.**

**October 15th-16th — Central Division,  
South Bend, Ind.**

**October 22nd-23rd — Midwest Division,  
Omaha, Neb.**

## **Strays**

The somewhat dubious honor of being the first ham to cause TVI may belong to Tom Marshall, W5RFF. Here's his story: "Back in 1936 or '37 New Haven, Conn., was celebrating its 300th birthday, and I set up a ham station at a booth in the armory. Among the exhibitions was a demonstration of television by the Baird outfit — scanning disk, neon-bulb receiver, and so on. During one of the TV shows the director came screaming out of the darkened tent and made straight for the ham station — yep, we were taking his picture out! To keep peace, we installed a push-button at the TV demonstration and a red light at our station, so when the light went on we stayed off."

As W5RFF says, "What a claim!" But it's probably another ham "first."

— ... —

Here's another one for the "What's in a call?" department: WN1FEM is a YL, Elizabeth M. White, New London, Conn., but W1MRS, Ralph Saija, Brookline Mass., is an OM!

— ... —

Ironie, isn't it? Sir Robert Watson Watt, the noted radar pioneer, was fined twelve dollars by Kingston, Ont., authorities for speeding. The police had clocked his car — with radar!

— I.R.T.S. News

— ... —

W5RFF has been using the multivibrator circuit of Dudley's 50-ke. frequency marker (p. 14, March, 1955, *QST*) to get 10-ke. intervals, the only change from the original circuit being to substitute 500- $\mu$ f. silver micas at  $C_{10}$  and  $C_{11}$ . The multivibrator locks readily with crystals ranging in frequency from 100 to 600 ke. (at even 100-ke. intervals, of course, for 10-ke. output).

— ... —

W. Bert Knowles, VE3QB, for 22 years ARRL's QSL Manager for all VE3s, was recently the victim of a fatal accident.

From the inception of the present system of Bureau Managers, in August, 1933, Bert had served the hobby he loved so well. There is no question that the major portion of his hobby time was devoted to the tedious job of handling DX QSLs for fellow hams. Bert Knowles' ham career is an outstanding example of unselfish service to the fraternity.

## OUR COVER

The diminutive unit shown on this month's cover is a streamlined modern version of the "Little Gem" which appeared in *QST* almost a decade ago. This new measuring device features compactness, simplicity and versatility. For more information see "The Transistorized 'Little Gem'" by *QST* Technical Assistant E. Laird Campbell, W1CUT.

# An Improved Antenna Bridge

*Increased Accuracy and Convenience in Impedance Measurements*

BY R. WADE CAYWOOD,\* WIKRD

• Most earlier designs of simple variable-impedance bridges for antenna and other r.f. impedance measurements have been open to serious objections because of inherent inaccuracies. Described here is a circuit that overcomes these objections and offers greater convenience in operation. Also described is a balun of novel construction for eliminating errors in measurements on balanced lines and loads.

It is often desirable to determine the resistance and resonant frequency of an antenna, to check the standing-wave ratio on a transmission line, to find receiver-input impedance, and to make many other r.f. impedance measurements. The antenna bridge described here offers an improved means for making these measurements, and at the same time is simple in design and easy to construct and use.

Fig. 1A is the fundamental circuit of a standard Wheatstone bridge. Fig. 1B shows two adaptations of the Wheatstone bridge for radio-frequency measurements; the similarity between these diagrams and the basic d.c. resistance bridge is obvious. In the development of such bridges, a subsequent step was that of using the adaptation in Fig. 1B to make a fixed-impedance standing-wave-ratio bridge. The schematic circuit diagram of such a bridge is shown in Fig. 3C.  $R_4$  can be a 51-ohm carbon resistor for 50-ohm coaxial line. The two ratio arms consisting of  $R_2C_2$  and  $R_3C_3$  are identical so that the bridge unbalance is minimum when the impedance connected to the output jack is equal to 51 ohms and is a pure resistance. If the impedance differs from 51 ohms the meter reading will not be zero and the instrument can be calibrated either in terms of impedance or standing wave ratio. However, at impedances other than 51 ohms, the accuracy of measurement frequently is not too good.<sup>1</sup>

In an attempt to avoid being restricted to a fixed impedance, bridges have been made using a potentiometer in one arm. This seems like an obvious solution, but there are several disadvantages to this type of bridge. Principally, there

is a substantial frequency error because a potentiometer is not a pure resistance but a combination of resistance and reactance, and as the arm of the potentiometer is moved, the ratio of resistance to reactance changes. Hence the accuracy of measurement is relatively poor and the calibration depends on frequency. Thus the substitution of a potentiometer in the simple fixed-resistance bridge is not too good a solution.

A disadvantage of bridges using all resistance arms is that the r.f. power requirements, while not large in terms of watts, are often greater than can be supplied by a grid-dip meter. It therefore becomes necessary to use a transmitter to supply the power, but since even a low-power transmitter generally has an output sufficient to overload the bridge components, some provision must be made for reducing the power to the proper level. A grid-dip meter would be a more convenient power source.

A circuit suggested by S. W. Seeley, W2ZE, offers the possibility of very considerable improvement in both respects. In this arrangement a differential capacitor supplies the variable components of an adjustable-impedance bridge, and since capacitance can be measured much

Fig. 1—The basic Wheatstone bridge (A) and adaptations (B) for r.f. use. (C) is a typical practical circuit for a bridge with fixed-resistance arms.  $C_1$ ,  $C_2$  and  $C_3$  in this circuit are blocking capacitors.

\* Chief Engineer, James Millen Mfg. Co., Malden, Mass.

<sup>1</sup> This is partly because the accuracy of such a bridge tends to decrease, as a practical matter, with an increase in the ratio of the impedances in the unknown and standard arms. Also, as has been pointed out many times in *QST* and the *Handbook*, for accurate measurement it is essential that the indicating circuit have good linearity and extremely high impedance compared with the bridge impedance, and that the r.f. input voltage be maintained constant when the load is disconnected or short-circuited for the reference voltmeter setting. — Ed.

The simplicity of the bridge is evident from its appearance. The unknown impedance to be measured is connected to the coaxial jack on the side, and r.f. from a grid-dip meter is coupled to the loop at the left.

more accurately than resistance at r.f., and can easily be kept "pure" at ordinary frequencies, a high order of bridge accuracy becomes possible. A differential capacitor is a dual capacitor so arranged that as the shaft is turned the capacitance of one unit decreases by the same amount that the capacitance of the other increases; in a bridge, the two capacitors become the variable ratio arms. The practical form of W2ZE's circuit is shown in Fig. 2, where  $C_1$  is the differential capacitor.  $C_1$  does not use up any of the r.f. input power, and when a microammeter is used as an indicator, the circuit will operate well from a grid-dip meter source even with loose coupling.

The only fussy part of the bridge is the differential capacitor. For compactness and reduction of stray effects this capacitor, like the one shown in the accompanying photograph, should be designed especially for the purpose. Two identical single capacitors, ganged together so that one is at maximum when the other is at minimum capacitance, may be usable; however, the frequency error will be greater even though the assembly is kept as compact as possible to minimize stray inductance.

The differential capacitor which is the heart of the bridge circuit. The copper shielding fastened to the rear end plate is to prevent stray coupling to other components in the bridge.

## Construction

The photographs show the construction of a bridge built to W2ZE's design. As can be seen by looking at the inside view, the unit is not at all complicated; however, it is advisable to stick to the suggested components and layout. Obviously it is undesirable to have unnecessary lead inductances or capacitances between bridge arms. As shown in the inside view of the bridge and in the photograph of the differential capacitor, a copper shield is placed around the top part of the capacitor to shield the stators from the other elements of the bridge. Since the calibration accuracy at the upper end of the frequency range is limited by stray capacitances between bridge elements, the addition of this shielding raises the upper frequency limit at which the bridge maintains its accuracy. With the shield around the condenser the frequency error is very small up to at least 50 Mc.

The choke in the bridge is a miniature powdered-iron-core layer-wound solenoid. The lead

$C_1$  — Differential capacitor, 11–161  $\mu\text{f.}$  (Millen 28801).  
 $C_2$  — 0.01- $\mu\text{f.}$  disk ceramic.

$R_1$  — 51 ohms, 2-watt composition, 5% tolerance.

$J_1$  — Crystal socket.

$J_2$  — Coaxial connector.

RFC — Miniature choke, 200  $\mu\text{h.}$ , iron core (Millen J300-200).

CR1 — Germanium diode, 1N34A suitable.

between the coaxial input connector and the capacitor is a short piece of flat copper ribbon. Any revision in the layout that results in longer leads will tend to result in increased frequency error.

The Type 1N34A germanium diode was used because it is satisfactory and because it is generally available. Other types should be equally satisfactory, however.

R.f. is introduced into the bridge circuit through the crystal socket shown at the bottom of the unit in the inside view. Three plug-in pick-up loops are used for coupling the output of a grid-dip meter to the bridge. These coils have 1, 3 and 10 turns, respectively, and are mounted on Millen 37412 300-ohm transmission line plugs. The 10-turn coupling coil, which is 1½ inches in diameter, resonates in the bridge over the approximate range 5.2 to 8.8 Mc., de-

Fig. 3—Calibration curve of the bridge shown in Fig. 2 and the photographs.

pending on the impedance (that is, capacitor) setting. The 3-turn coupling coil, also  $1\frac{1}{2}$  inches in diameter, resonates from 15.5 to 30.5 Mc. and the 1-turn coupling coil (1 inch in diameter) resonates from 32 to 84 Mc. With the bridge set to 50 ohms the 10-turn coil and the 3-turn coil result in the same coupling at 12 Mc.; consequently, the 10-turn coupling coil should be used for measurements below 12 Mc. The 3-turn coil and the 1-turn coil result in approximately the same coupling at 40 Mc.; consequently, the 3-turn coil should be used for measurements between 12 and 40 Mc. and the 1-turn coil should be used above 40 Mc. In general, the coupling coil closest to resonance at the particular capacitor setting in use should be chosen. It is, of course, possible to make coupling coils that will be resonant at the particular frequency for which a measurement is desired, but experience has

shown that the three coils suggested cover the range adequately. Other coils would be required only under certain very special circumstances.

The 3-turn coupling coil was made by threading the 3 turns through a piece of spaghetti cut to the proper length. The 10-turn link can be wrapped in insulating tape and thoroughly doped in coil cement, or the coil can have a coating of vinylite built up on it by repeated dipping in liquid vinylite material which is readily available for caulking and waterproofing. This material apparently has no harmful effect upon the coils.

### Calibration

The theoretical calibration of angular setting of the capacitor rotor vs. impedance is a shallow S-shaped curve, when plotted on semilog paper, symmetrical with respect to the design center impedance. The curve for the bridge described here is shown in Fig. 3.

A similar curve can be constructed for a given bridge by connecting carbon resistors of various values between 5 and 500 ohms to the output connector and adjusting the capacitor for a null in each case, using a calibrated grid-dip meter as the source of an r.f. voltage of known frequency. A similar procedure at various frequencies within the range of the grid-dip meter will show whether there is any appreciable frequency error, and if so, the frequency at which it tends to become im-

Inside view of the bridge. Components are easily identified with the possible exception of the miniature choke, which is mounted between the left-hand meter terminal and the junction between the 1N34A and the ceramic blocking capacitor.

portant. Lead length between the body of the test resistor and  $J_2$  should be kept to a minimum, particularly with the lower resistance values.

For highest calibration accuracy the test resistors should be measured with an accurate resistance bridge or ohmmeter so their actual resistance is known. If suitable instruments are not available for measuring the resistances, resistors having 5 per cent tolerances or less should be used.

### Applications

When used with coaxial lines or other loads that can have one side grounded, the bridge is applied

Two views of the wound balun. This circuit covers the 10-20-meter range. Similar baluns for other frequencies may be designed and constructed by the method outlined in the text.

to amateur antenna and impedance problems in exactly the same way that the older-type bridges, both fixed and variable, have been applied. Since this subject has been very adequately covered in amateur publications, we will add only a few notes here. The only real difference between this and the previous instruments is the ease with which measurements can be made and the improved

accuracy. The r.f. input to the bridge is not critical, but with a 50-microampere meter movement such as is used in the circuit shown, the measurements should begin with loose coupling to avoid the possibility of damaging the meter. Actual use of the instrument is very simple and in general the procedure for measuring impedance is as follows:

- 1) Couple an r.f. voltage of the desired frequency to the bridge.
- 2) Adjust the coupling by moving either the bridge or the r.f. source so that the meter indicates about 40 microamperes.
- 3) Connect the unknown impedance to  $J_2$ .
- 4) Adjust the dial for minimum meter reading.
- 5) Read the value of the unknown impedance from the calibration.

In this connection, it should be noted that the impedance being measured may not be a pure resistance, in which event the minimum reading will not be an actual null. If a good null (meter reading zero or very close to it) cannot be obtained, the bridge calibration does not hold. (This is true of any bridge circuit which does not incorporate special means for separating the resistive and reactive components of the unknown impedance.) Conversely, a complete null does indicate that the unknown impedance is a pure resistance. With complex unknowns, the reactive component can be tuned out by one of a number of well-known methods, leaving only the resistive component to be measured by the bridge. In such a case, the criterion for proper reactance compensation is the fact that the null is complete.

For s.w.r. checks the bridge capacitor should be set to the calibration point corresponding to the characteristic impedance of the coaxial transmission line in which the s.w.r. is to be measured. This setting should be left unchanged during any subsequent adjustments to matching devices, the object being to adjust the matching circuit to obtain the lowest possible reading on the meter. As is usual, a complete null indicates a 1-to-1 standing-wave ratio.<sup>2</sup>

Balanced lines or loads may be measured with the bridge by using a circuit that provides suitable balanced-to-unbalanced coupling between the bridge and load. The wound balun devised by W2ZE and described below is a very convenient form of such circuit.

### The Wound Balun

A wound balun is simply an accurate 2-to-1 auto transformer with the residual reactances

<sup>2</sup> Although the factors mentioned in Footnote 1 do not affect the accuracy of impedance measurement with the bridge described, since the bridge is always adjusted for a null in such measurements, they do apply with full weight to the measurement of standing-wave ratios higher than 1 to 1. For s.w.r. measurement, provision for checking the input voltage should be included in the circuit of Fig. 2, and a resistance of at least 10,000 ohms — preferably as much as 50,000 — should be placed in series with the microammeter. However, these precautions are not necessary for purely qualitative comparisons nor for facilitating matching-circuit adjustments where the object is to attain the lowest possible meter reading. Most amateur uses of an s.w.r. bridge are in this category. — Ep.

A balun for 40 and 80 meters, using 150-ohm Twin-Lead (Amphenol 14-079 or Alpha 1151) for the bifilar winding. There are 8 turns of Twin-Lead on  $2\frac{3}{4}$ -inch diameter bakelite tubing. The shunt tuning capacitance for 80 meters is  $62\ \mu\text{f.}$ ; no shunt capacitor is needed for 40 meters. The series capacitance for 80 meters is  $0.0015\ \mu\text{f.}$  and for 40 meters is  $0.001\ \mu\text{f.}$

This model uses a female coaxial connector, which accounts for the double-ended male connector shown in place.

tuned out and as tight coupling as possible between the two halves of its total winding. If the impedance is measured between a grounded center-tap and one terminal of the winding when a balanced load is connected across it, the 2-to-1 turns ratio produces a 4-to-1 step-down in the impedance measurement. For example, a properly-terminated balanced 600-ohm line connected to the outside terminals of the winding would be measured as 150 ohms between the grounded center-tap and either end. This means that the readings of the antenna bridge must be multiplied by four when using the balun. Thus the range of a 5-500-ohm bridge becomes 20-2000 ohms for balanced loads. This coincides with the usual higher impedances of balanced lines. Use of a balun maintains balance during measurement and thus obviates the wild errors usually encountered when one tries to measure any balanced-line impedance without first converting it to a single-ended load.

There are five principal requirements for the construction of an accurate wound balun:

- 1) The two halves of the winding must be as nearly equal and as symmetrically positioned as possible.
- 2) The coupling between the two halves of the winding must be as close to 100 per cent as possible.
- 3) The  $Q$  of the winding must be high.
- 4) The total inductance must be resonated to the frequency of operation by a shunt capacitor across the balanced terminals.
- 5) The residual leakage reactances should be tuned out by means of a capacitor in series with the "hot" single-ended terminal.

These five objectives are accomplished in the following manner:

Symmetry and tight coupling, (1) and (2), are obtained by making the two halves of the winding bifilar. In the 10-20 meter balun illustrated the 2-inch diameter lucite form is wound with its 3-turn windings paired in double-thread, 7 t.p.i. lathe-cut grooves. In winding, the wire starts at the beginning of one thread, continues for three turns to the end of that thread, goes through a hole to the inside of the form, back to a hole

leading out to the start of the second thread, then continues in that thread for three more turns to the end of the winding. The center of the wire, where it goes from the end of the first thread to the beginning of the second, is the exact physical (and electrical) center of the two windings. That point is joined by a short, heavy strap directly to the body of the male coaxial connector.

The  $Q$  of the illustrated balun turned out to be 235 at 14.3 Mc., which is the equivalent of about a 50,000-ohm resistor in shunt with the balanced load to be measured. This causes an error of about 4 per cent in the reading of a 2000-ohm load but only 1 per cent for a 500-ohm load.

When this balun was tuned to operate at 28 Mc., it showed almost exactly the same shunt resistance. Several transmission-line baluns that were tried showed four to five times the error of this wound balun due to their lower  $Q$ .

Tuning out the residual reactances of the wound balun can be done rather easily with the aid of a grid-dip meter. The problem is somewhat simplified if one first calculates the amount of capacitance required to resonate the total winding to the center of the frequency band in which it is to be used. In the case of the illustrated balun, the Lightning Calculator indicated  $2.6\ \mu\text{h.}$  which would require a total capacitance of  $49\ \mu\text{f.}$  to resonate it to the center of the 20-meter band. It was estimated that the coil distributed capacitance would be about  $10\ \mu\text{f.}$  so a fixed  $39\text{-}\mu\text{f.}$  ceramic was connected across the balanced terminals. The grid-dipper then showed resonance at 14.3 Mc., which was plenty close enough.

At first it was thought that the small residual leakage reactances could be tolerated without a correcting condenser in series with the single-ended output. But it turned out to be such an easy job to find the correct value and put it in, and the increased accuracy thus gained was so immediately apparent, that it seems well worth while to include it.

As a starter, it was assumed that the leakage inductance of the coil and leads would be somewhere in the neighborhood of 2 to 3 per cent of the total coil inductance. This would take a con-

# The Transistorized "Little Gem"

*A Versatile R.F. and D.C. Meter*

BY E. LAIRD CAMPBELL, W1CUT

THE high cost of transistors has limited transistor use in amateur radio. Recently, however, low-cost transistors have been made available, and we can expect to see them in frequent use. Since the transistor is very small, light in weight, rugged and easily powered by a small pen-light cell, its logical application is to portable equipment. The above advantages obviously add up to the transistor's application to portable measuring devices for the ham. The instrument described here can be used in five different ways: field-strength meter, wavemeter, microammeter, milliammeter, and 'phone quality monitor. It is a "natural" for mobile work as it can be carried about without restricting wires or bulky batteries.

The transistor in this unit operates as a current amplifier to multiply the input signal to a value high enough to be indicated on a 0-1 milliammeter. This allows a less expensive and more rugged milliammeter to be used instead of the usual expensive microammeter.

The diagram of Fig. 1 shows the circuit of the instrument. When used as a field-strength meter or a wavemeter, the signal from the source to be measured is received by the antenna and tuned by  $L_1C_1$ . It is then rectified by the crystal diode and impressed on the transistor where it is amplified and indicated on the meter. Since the transistor inherently has a static collector current under no-signal conditions, some means must be provided to electrically balance or zero the meter. This is accomplished by adjusting the variable

• Almost 10 years ago (January, 1946) *QST* carried a description of the "Little Gem," an absorption-type wavemeter that doubled as 'phone monitor and field-strength indicator. By adding the gain of a transistor d.c. amplifier stage, the sensitivity of the gadget is increased considerably, and what is normally a milliammeter becomes a microammeter. This will be found to be a handy and useful instrument to have around the shack. Once you have used it you will see why it is called the "Little Gem."

resistance,  $R_1$ . If the signal being measured is very strong, no external antenna will be necessary for full-scale deflection. When more sensitivity is needed, a short piece of stiff wire can be connected to the antenna binding post.

If it is desired to check the quality of a 'phone signal, it is only necessary to plug a pair of headphones into the 'phone jack. The closed-circuit jack isolates the meter from the circuit and allows the amplified audio component of the rectified signal to be heard.

When the instrument is to be used as a microammeter, the transistor is switched from the diode rectifier circuit to polarized pin jacks mounted on the cabinet. The transistor continues to operate as a current amplifier, and full-scale deflection can be obtained with a very small cur-

The transistorized "Little Gem" with plug-in coils which provide coverage of all amateur bands, 160 through 6 meters. The 'phone jack is mounted on the side of the cabinet and insulated by fiber washers.

rent flow at the input. Since the basic movement of the meter is 0–1 ma., switching is provided to isolate the meter for milliamperere readings. The two pin jacks used for microampere readings are also used for measuring milliamperes.

### Construction

The unit is constructed in a  $4 \times 2 \times 4$ -inch utility cabinet. Placement of the components is not critical for operation, but some care must be exercised because of space considerations. The meter and the tuning control,  $C_1$ , are mounted on the removable front plate. Since the meter is mounted at the very top of the face plate, some of the lip on the box will have to be removed to allow the meter to fit properly. Function switch, zero adjust control and pin jacks are all mounted on one end of the box, with the coil socket and antenna post on the other. The 'phone jack and holding handle are secured to opposite sides of the box. The handle on this unit was placed for a left-handed person but it can be mounted on either side. The transistor is supported by its own leads, and great care must be exercised in soldering because an excess of heat will permanently impair its operation. It is good practice to hold

the leads of the transistor with long-nose pliers while soldering so the heat will flow into the pliers and not the transistor. A small pen-light cell is used to power the transistor and it is supported by soldering the plus terminal of the cell to the tie-bolt of the switch assembly. The negative or case side of the cell is not supported and the lead to it is soldered to the bottom of the cell. Plug-in coils for the unit are wound on Amphenol miniature plug-in coil forms which require a special socket (Amphenol 78-85S). The range of the coils in this set covers 1700 kc. to 120 Mc. If it is desired to include the 144–148 Mc. band, a smaller tuning capacitor should be used.

### Operation

To use the instrument as a field-strength meter or microammeter, the function switch is turned to the desired position and the meter is balanced by rotating the zero adjust

control until the pointer is set on zero. The meter is now ready for use and no further adjustments are necessary. To measure the strength of a signal, the tuning control is turned until the maximum reading is found. Once the tuning control is set, relative strength measurements can be made for different antenna conditions. A calibration chart

(Continued on page 112)

# 807s in Parallel

## 75- to 150-Watt Amplifier with Pi-Section Output

BY FRANCIS M. YANCEY,\* K4CDO

THE amplifier shown in the photographs was designed to cover all bands from 3.5 to 30 Mc. It can be operated at an input of 150 watts on c.w., or 120 watts on 'phone. However, it will operate efficiently at 75 watts input for Novice use.

### Circuit

A pair of 807s in parallel is shown in the circuit diagram of Fig. 1. A pair of 1625s may be substituted if a 12.6-volt filament transformer is provided.

The amplifier is capacitively coupled to the driver through the 100- $\mu$ f. mica capacitor,  $C_1$ . (If the driver includes an output coupling capacitor,  $C_1$  may be omitted, of course.)  $L_1$  and  $L_2$  are small inductors which, in conjunction with  $R_2$  and  $R_3$  in the screen leads, are used for the suppression of v.h.f. parasites.

A combination of battery and grid-leak bias is used. Since the screens are operated from a low-voltage source, the fixed bias provided by the battery will cut the input to the 807s to zero when excitation is removed, as in keying preceding stages for c.w. operation. When the screens are supplied through a dropping resistor from the

\*523 Taylor St., Lexington, Va.

• Judging from our mailbag, the greatest demand in transmitters these days is for a job running at 100 to 150 watts input. This parallel 807 job fills the bill quite simply and inexpensively.

plate supply, as required for plate-screen modulation, the battery will hold the input to a safe level in case of excitation failure, although the input will not be reduced to zero.

A pi-section tank circuit is used in the output, and parallel plate feed is therefore necessary. Either a rotary inductor from a surplus BC-375-E antenna-tuning unit or a Johnson type 229-201 inductor may be used as the variable inductor,  $L_4$ .  $L_3$  is a separate inductor for 10-meter operation. It will not be needed if the Johnson inductor is used, or if the surplus inductor is used and 10-meter operation is not required.

The required output capacitance is furnished by a combination of a variable capacitor,  $C_5$ , and several fixed capacitors that may be switched in parallel with the variable. A total of about 2000  $\mu$ f. should be provided. For a continuous range of capacitance, each of the fixed capacitors

Top view of the parallel 807 amplifier. The variable output capacitor is at the upper left with the fixed mica capacitors and switch in the corner. The variable input capacitor is to the right of the variable inductor. The r.f. choke and by-pass fastened to the rear wall of the chassis are in the plate circuit. The biasing battery can be seen in the compartment to the right which also houses the input-circuit components.  $L_3$  and  $C_6$  were not used in this unit.

Panel view of the 150-watt amplifier showing the grid-meter jack, and controls for the pi-section input capacitor, variable inductor, variable output capacitor and fixed-capacitor switch.

should have a capacitance not greater than the maximum capacitance of the variable. As an example, a 500- $\mu\text{mf}$ . variable and three 500- $\mu\text{mf}$ . fixed capacitors may be used. A 250- $\mu\text{mf}$ . variable, on the other hand, will require seven 250- $\mu\text{mf}$ . fixed capacitors and a switch to accommodate them.

$RFC_2$  removes the d.c. plate voltage from across the input and output tuning capacitors, reducing the required voltage rating of these capacitors. It also provides protection against plate voltage appearing on the transmission line should the plate blocking capacitor,  $C_3$ , break down. In this event,  $RFC_2$  will short-circuit the plate supply. If the primary of the plate transformer is provided with a 3-ampere fuse, the supply will be protected.

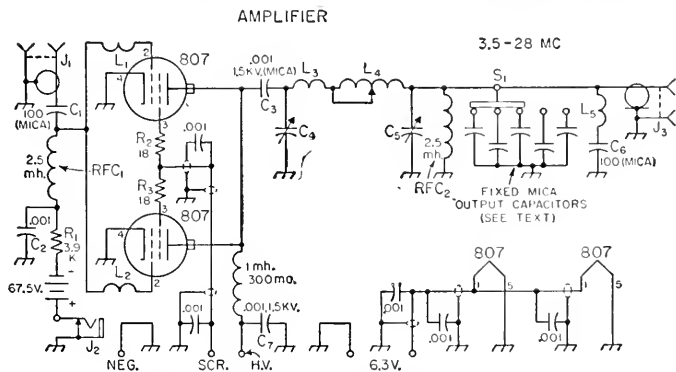

$C_6$  may be useful in localities where TVI is bothersome on one particular v.h.f. channel. In this case, the capacitor can be series-resonated to the particular channel by adjusting its lead length (represented by  $L_5$ ). It should be connected directly across the output coax connector.

Plate and grid milliammeters are not included in the unit, but are mounted externally on another panel to keep them out of r.f. fields.  $J_2$  is provided for plugging in a cord from the grid milliammeter while checking grid current. The plate meter is wired in permanently through terminals at the rear of the chassis. If desired, the jack can be omitted and the grid milliammeter wired in permanently, also.

### Construction

An inverted 10 × 17 × 4-inch aluminum chassis is used as a shielding enclosure for the amplifier. A standard bottom cover is used as the top cover. The chassis and the cover are perforated in the area near the tubes to provide ventilation. Holes in addition to those provided are drilled in the cover and along the lips of the chassis so that the cover may be secured tightly to the chassis with No. 6 self-tapping screws. The chassis is centered behind a standard 5¼-inch aluminum rack panel.

The S07s are mounted horizontally from a

All capacitances less than 0.001  $\mu\text{f.}$  are given in  $\mu\text{f.}$   
All fixed capacitors disk ceramic unless otherwise specified.  
All resistors  $\frac{1}{2}$  watt unless otherwise indicated.

partition spanning the chassis. This partition is made from a piece of aluminum cut  $4\frac{3}{4}$  inches wide by 10 inches long. Half-inch lips are bent over at the front end and along the bottom edge for fastening it with machine screws to the front wall and bottom of the chassis. The partition is spaced 2 inches from the end of the chassis. The tubes are provided with aluminum shield cans, and the sockets placed sufficiently far to the rear to leave space for the input capacitor,  $C_3$ .

Most of the assembly and wiring to the sockets can be done before the partition is fastened permanently in place. Pins 4 and 5 of each socket should be grounded right at the socket. The No. 2

bottom end of  $RFC_1$  and an insulated tie point, and the grid by-pass,  $C_2$ , is connected between the bottom end of the choke and a ground on the partition. The negative terminal of the biasing battery is also connected to this tie point, while the positive terminal goes to  $J_2$ .

Three shielded and by-passed leads are prepared as described in the TVI chapter of the *ARRL Handbook*. One lead is connected to the junction of  $R_2$  and  $R_3$ . The other two leads are fastened to the No. 1 pins of the sockets. After the partition has been fastened in place, the lead from the junction of the resistors should be connected to the screen-voltage input terminal. The other two leads both are run together to the ungrounded heater input terminal. The shields of these three leads are grounded at both ends, to each other, and to the chassis at several points.

The plate blocking capacitor,  $C_3$ , is mounted with one of its terminals central in respect to the two 807 plate caps to permit plate leads of equal length. The parallel-feed plate choke,  $RFC_3$ , is mounted off the rear wall of the chassis, with its cold end close to the high-voltage input terminal. The plate by-pass,  $C_7$ , is fastened against the rear wall of the chassis, and is connected between the cold end of the r.f. choke and the high-voltage input terminal with the shortest possible leads.

The variable inductor cannot be mounted centrally in the chassis without interfering with the removal of the 807s. It is placed an inch or so away from the plate caps of the tubes, and the input and variable output capacitors are spaced symmetrically on either side. The fixed capacitors in parallel with  $C_5$  are stacked up and fastened to a grounding bracket attached to the left-hand end of the chassis. The front terminals of these capacitors are connected to the terminals of  $S_1$  mounted immediately in front.

### Adjustment

The values of input and output capacitance and the value of the inductance to be used in the pi network will depend upon the voltage and current at which the amplifier is operated. For full input on c.w., a voltage of 750 at 200 ma. is required for the plates, and 250 volts at 12 ma. for the screen grids. In this case, screen voltage is best obtained from the exciter plate supply. For full input on 'phone, a supply delivering 600 volts at 200 ma. is needed, and 275 volts at 13 ma. for the screens. For 'phone work, the screen voltage should be taken from the plate supply through a 25,000-ohm 20-watt resistor.

For Novice operation, the amplifier can be operated, for instance, at 500 volts, 150 ma. with both tubes in use, or at 750 volts, 100 ma. with one of the tubes removed.

An accompanying table shows the values of input and output capacitance and the inductance required for a tank-circuit  $Q$  of 12 and 50-ohm output under the four operating conditions described above. The Johnson inductor does not have sufficient inductance for a  $Q$  of 12 under

pins are joined by the two resistors  $R_2$  and  $R_3$  in series.  $RFC_1$  is a National R-100-S, or similar model, with an insulating mounting. It is placed centrally between the two sockets and between the partition and the end of the chassis. It is eventually fastened against the bottom of the chassis. However, until the assembly is ready to be fastened in place, it is suspended by its leads. The two parasitic suppressor chokes,  $L_1$  and  $L_2$ , are connected between the No. 2 pins on the sockets and the top of  $RFC_1$ . If  $C_1$  is used, it should be connected between the top of the r.f. choke and the excitation input connector,  $J_1$ . Otherwise, a short piece of wire should be substituted. The grid leak,  $R_1$ , is mounted between the

# Power and Meter Facts in S.S.B. Operation

## *Interpreting the Linear-Amplifier Plate Meter Reading*

BY HOWARD F. WRIGHT, JR.,\* WIPNB

• Here is some down-to-earth talk about linear amplifiers, power ratings and meter readings that is "must" reading for all s.s.b. enthusiasts. WIPNB presents the case in simple, nontechnical language and with illustrations that clearly demonstrate the basic principles.

ward. In this it also fails. If a constant sound is used instead of words, the meter stabilizes at an "average" value. When the signal varies with the syllables of speech, the meter bobbles around. The amount of movement depends upon many factors. Meters can have differing time constants (speeds of response). Different voices contain varying amounts of "average" power. The amount of swing depends, to some degree, upon the class of amplifier operation: AB<sub>1</sub>, AB<sub>2</sub>, or B.

**D**o you ever see an article mainly concerning the plate meters of final r.f. amplifiers? For that matter, have you ever given the subject much thought? Well, if not, it's certain that you have never used a linear amplifier in single-sideband suppressed-carrier operation. Of course, if you are a person with absolutely no aspirations toward s.s.b. in the future, you might be excused for saying, "Who cares?" However, the way things are progressing on the "Donald Duck" front, I think there are many who will be interested in the following material.

Why all the fuss about meters? In the days of regular a.m. there wasn't much concern. The d.c. plate meter gave most of the answers without complaint. Watch the meter. Tune up the rig. Figure the power input — no strain, no pain! What could be neater? To say that this no longer holds true with a linear amplifier in suppressed-carrier service would be quite an understatement. Strong men have wept bitter tears and spent sleepless nights because of the behavior (or misbehavior) of their linear's plate meter. Why? Simply because most of us seem to find it extremely difficult to modify our nearly complete, all-abiding faith in the value of the plate meter in indicating final amplifier performance.

Let's get down to brass tacks. The attitude of an amateur toward the plate meter of his linear final, under voice conditions, is of great importance. It could, from a broad point of view, mean complete success or partial failure of amateur narrow-band communication techniques.

Why does the d.c. plate milliammeter fall down so badly in indicating the performance of amplifiers in s.s.b. voice service? It's because the meter is no longer able to settle at a steady value as it did in the amplification of unvarying carrier signals. The voice modulation consists of sporadic bursts of energy. They say, "The hand is faster than the eye." If so, the voice is certainly faster than the meter. The meter just doesn't move rapidly enough. It starts to follow the first voice impulse up, but moves so slowly that it meets the signal coming down. Then it tries to follow down-

### *Distortion*

A "linear" must amplify the signal from its exciter without changing the waveshape of the original signal. Any change of waveshape is distortion. Distortion means that new signals are generated. These new signals result in splatter. Serious splatter needs no comment.

Every linear amplifier has an amplitude point at which it will produce no further undistorted output. Although the driving signal continues to increase, the output no longer increases in exact proportion. While any change of the signal waveshape at levels other than this maximum value also causes some trouble, it is most imperative that the "limiting" or "flattening" point not be exceeded.

I have previously indicated that the plate meter is basically incapable of indicating the peaks of a voice signal. Any relationship between voice excursions of the plate meter, as it measures d.c. power input, and undistorted unflattened amplifier output is apt to be purely coincidental.

We now have both elements of a conflict. On one hand there are the years of reliance upon the plate meter in indicating amplifier performance, and on the other the meter's basic inability to show lack of linearity. If the meter is such a poor performer, why do we continue to use it? Simply because, when properly interpreted, the meter is still a valuable gadget. It just needs a bit of understanding.

### *Meter vs. 'Scope*

Articles concerning linear-amplifier adjustment make adequately clear the fact that the oscilloscope is the best tool for indicating performance. Whether the use of this valuable instrument is any more vital to the adjustment of a s.s.b. transmitter than it is to making a conventional a.m. 'phone station work properly might be a matter for debate. While a gratifying number of amateurs are now using 'scopes, it would be unrealistic to think that all s.s.b. stations will ever be monitored at all times by operators using such instruments. In fact, an operator who understands what his plate meter means, in conjunction with some

\* 55 Sigourney St., Bristol, Conn.

Fig. 1

Fig. 2

Each of the accompanying photographs consists of a comparison between the plate milliammeter reading and the output waveshape of a linear amplifier. While each picture shows a different type of signal input, actual amplifier adjustment remains unchanged in all cases. The purpose of the comparison is to demonstrate the action of the average-reading meter as compared to the instantaneous-reading 'scope while indicating signals of varying wave-shapes.

Fig. 3

Fig. 4

Fig. 5

Fig. 6

form of output indication, can do quite well with no 'scope.

Each of the accompanying photographs shows a different condition of amplifier operation or type of signal input as seen on both a 'scope and the d.c. plate milliammeter. The purpose is to demonstrate the action of the average-reading meter as compared to the instantaneous-reading 'scope. Both continuous signals and voice are used.

Fig. 1 shows a two-tone test signal. This type of signal is used to determine linearity and lack of distortion on all parts of the waveshape. At this time, notice only one thing. The top of the pattern remains unflattened and fills up the space between the limit lines. No splatter caused by distortion of peaks occurs as long as we do not try to exceed the limits while using this set of amplifier conditions. This holds true in all the following pictures regardless of the type of signal input.

Fig. 2 shows the amplifier being driven into distortion on the two-tone signal. The peak linear-

*Fig. 1 — The "two-tone" linearity test signal which was used to adjust the amplifier for low distortion over all parts of the waveshape. At this time, notice only one thing: the top of the pattern remains "unflattened" or "unsquashed." It extends exactly from one horizontal line on the oscillogram to the other. These lines represent the point of peak linearity capability of the amplifier. No splatter caused by "limiting" of peaks can occur as long as we do not try to drive any type of signal past the amplitude point represented by the lines. This holds true in all of the pictures.*

*Fig. 2 — The amplifier driven into heavy distortion on the same test signal. The linearity capability has been exceeded. Note the "squashing" of peaks. Now compare the meter reading to that of Fig. 1. The meter shows what we all like to see — more power input; but the 'scope indicates this is distorted power.*

*Fig. 3 — The result of inserting a steady audio tone into a s.s.b. exciter. It may not look like sine-wave radio, but that is because we no longer have an audio signal. The exciter converted the single tone audio into single frequency r.f., the same as an unmodulated carrier. (The slight ripple represents imperfect sideband and carrier suppression and harmonic audio distortion.) Look at the meter! On steady signal the amplifier has no time to rest. It works regularly — not in spurts — as on voice. The meter has a chance to indicate maximum signal input.*

*Fig. 4 — Actual voice waveshapes. A sustained note was used for clarity of presentation. Notice that the high-amplitude low-energy peaks which are encountered in the voice just reach the lines representing maximum permissible amplitude. Look at the meter. Oh, how sad! That is the current we must use to figure power input.*

*Fig. 5 — The audio gain increased to give a more satisfying meter reading. Yes, the meter reads more, but look at the 'scope. Those peaks are really flattening. Splatter! Zounds! No escape! A clean signal dictates low meter reading, while greater deflection causes trouble.*

*Fig. 6 — Another voice sound, purposely altered by audio compression to increase the "average-to-peak" ratio. Notice that the meter again shows an increase over the conditions of Fig. 4. This is also due to "flattening" of the waveshape. Distortion of the audio signal is again present, as it was in Fig. 5, but no splatter is transmitted if the resulting new frequencies are carefully filtered out early in the exciter. New frequencies, caused by r.f. amplifier flattening, cannot be removed. They will be transmitted to plague adjoining channels.*

ity capability has been exceeded. Note the flattening of the peaks. Now notice the meter reading as compared to Fig. 1. The meter shows what we all like to see — more power — but the 'scope indicates that it is distorted power.

Fig. 3 shows the result of introducing a single audio tone into the speech amplifier. It may not look like sine-wave audio, but this is because we no longer have an audio signal. The s.s.b. exciter converted the single tone audio into single frequency r.f. — practically the same as an unmodulated carrier. Look at the plate meter! On steady signal the amplifier has no time to rest. It works regularly — not in spurts as on voice. The meter has a chance to indicate full maximum signal input.

Fig. 4 shows an actual voice waveshape. The sound used was a sustained "O-o-o-h-h-h." Notice that the "peaks" just reach the limit lines. Look at the meter. Oh, how sad! That's the current we must use to calculate power input!

Fig. 5 is the condition where the audio "gain" is increased to correct the low meter reading. Yes, the meter reads more, but take a look at the 'scope. Those peaks are really flattening. Splatter! Zounds! No escape! A clean signal means lower meter reading, while greater deflection causes trouble.

Fig. 6 shows the same voice sound, purposely altered by audio compression, to increase the "average-to-peak" ratio. Notice that the meter again shows an increase over the conditions of Fig. 4. This is also due to the flattening of the waveshape. Distortion of the audio is present, but no splatter results if the new frequencies are carefully filtered out early in the exciter. New frequencies resulting from r.f. linear amplifier flattening cannot be filtered out. They will be transmitted to plague adjoining channels.

Study of the photographs reveals that there is, as previously mentioned, lack of connection between d.c. meter readings and the type and quality of actual amplifier output.

The situation looks rather gloomy, doesn't it? Is it possible for an average amateur to operate a linear amplifier properly without access to laboratory measuring techniques? Well, the best answer I can give is that hundreds are doing it every day. Perhaps the meters don't give all the necessary indication, but never underestimate the flexibility of an amateur. The trial-and-error system can do wonders.

### *Splatter*

A chain of two or more linear amplifiers, upon construction, is hardly ever able to develop maximum rated output without considerable adjustment. Luckily, s.s.b. transmitting and receiving techniques have the valuable property of making nonlinear amplifier distortion and splatter stick out like a sore thumb. While the same amount of distortion would be partly hidden by the voice sidebands of a double sideband signal and be somewhat obscured by lack of selectivity in an ordinary receiver, such is not the case on s.s.b. There is no such thing as distortion splatter which

appears on only one side of the carrier frequency.

A s.s.b. receiver has an opportunity to view, generally unhindered by readable signal from the s.s.b. exciter, the amplitude, nature and frequency spread of nonlinear amplifier splatter appearing on the unwanted sideband. This situation makes possible accurate and worth-while on the air reports of amplifier performance. In cases of "peak limiting" distortion, one can simply turn down the gain until the person at the receiving end reports a clean "unwanted" sideband. Changes can then be made to try and allow more power without degrading the signal.

### Power Input

Now what about power input? Ask a s.s.b. operator exactly how much power he is running. The answer might sound something like, "Well, the plate voltage is 2000 and the meter kicks up to about 200 mils on voice peaks. That's about 400 watts. Of course, that's only meter reading. Actually, the peak power is a lot more than that."

Now really pin him down. Ask him what his "peak" power really is. For that matter, what does he mean by "peak power"? Chances are, his eyes might take on a rather furtive look. He might mention something about multiplying the meter reading by the factor 1.57. Don't press him too far. You might become as confused as he is.

Actually, the power-input situation is not nearly as complicated as it is confused. The indiscriminate use of the word "peak" to describe three distinctly different conditions is detrimental to the clarity of the otherwise fairly simple matter of power-input considerations.

The three uses of "peak," as heard on the air and seen in print, are "instantaneous peak power," "peak envelope power," and "meter peak, on voice, power." Unfortunately, it has seemed fashionable to omit the qualifying terms and call any one of them "peak power." When this happens, even a person who understands the situation perfectly must determine which yardstick is being used before giving intelligent consideration to the particular situation involved.

There are two ways which I could use to explain the different kinds of "peak power." One would be to draw a rather involved illustration of a modulated r.f. signal, showing both individual r.f. cycles and cycles of modulating voltage. The other, which I shall try, is to explain the same effects in a non-radio example which closely parallels the case of modulated r.f. energy.

Our example is to be a "four-way" reading lamp, one that plugs into the 110-volt a.c. socket and allows the user to select various conditions of brightness. One setting is "off" — the others

"...I COULD DRAW  
A RATHER INVOLVED  
ILLUSTRATION OF  
A MODULATED  
RF SIGNAL"

range from "dim" to full intensity of the 100-watt bulb. Now let's imagine that this light bulb represents the r.f. output signal of a s.s.b. transmitter, not in the usual sense of a "dummy load," but with the more abstract view that each cycle of 60-cycle a.c. current represents a similar cycle of high-frequency energy in the r.f. signal. Thus the lamp, burning steadily at full brilliance, represents a s.s.b. amplifier with full "inserted carrier" of 100 watts. Now, still in the abstract vein, the brightness control switch of the four-way lamp will be used to represent modulation. The switch is made to vary the brilliance of the lamp at a fairly slow and sporadic rate from one intensity to another. This simulates voice modulation. The remaining item in our flight of fancy is something to represent the plate milliammeter in the transmitter. Let's say that we connect an a.c. ammeter, with a very sluggish movement, in series with the a.c. cord to the lamp. This simulates the inability of a plate meter accurately to follow voice modulation. We are now ready to demonstrate the meaning of "instantaneous peak," "peak envelope or maximum signal," and "meter peak, on voice" power.

To find "instantaneous peak power," we turn our 100-watt light to full brilliance. For simplicity, let's say that the r.m.s. voltage is 100 instead of 110. Ohms Law says that the r.m.s. current is 1 ampere. Consider only one cycle of the 60-cycle wave. The "crest or instantaneous peak" voltage in this cycle is 1.41 times 100 volts. This is 141 volts. The current at "peak" is 1.41 amperes. If  $P = IE$ , the concept of "instantaneous peak power" says that 200 watts of power exist for an infinitely small period of time at the crest of the cycle. What does this mean from the point of view of a man reading a book? Nothing! He's got a lamp that gives a hundred watts of illumination and he knows it. The same holds true in a radio transmitter. "Instantaneous peak power" has very little value in everyday operation and adjustment.

Now to the heart of the matter — "peak envelope power" or "maximum signal power." This is possibly the most useful of our terms. It is the way tube manufacturers rate their product. More often than not, it is meant when one sees "peak" mentioned in print. What is the value in the case of our light bulb example? — 100 watts; it's as simple as that! Just a minute! How can the 100 watts be "peak power" and still be the value determined by multiplying average r.m.s. voltage times r.m.s. current (100 volts times 1 ampere)? This certainly gives "average" and not "peak" power. In this case, the word "peak" no longer

refers to the crest of the 60-cycle wave. To show what is meant, we no longer run the lamp at full power, but simulate modulation by varying the average power all the way from zero to maximum. Now the light bulb (or amplifier) doesn't work fully all the time. It has comparative periods of rest because the signal is pulsating at a sporadic rate. In this case "peak" refers to the fact that the full 100 watts average power only exists for a relatively short period of time. So short, in fact, that the sluggish a.c. meter in the line would never have a chance to indicate an amount of average power approaching the 100 watts we know briefly exists.

The obvious solution to determining "maximum 'average' signal power" is to switch the lamp to full brilliance and leave it there while the meters catch up. The same holds true with a s.s.b. transmitter. Never measure "peak envelope or maximum signal power" under voice conditions. Insert carrier or whistle into the microphone and the meters will accurately record this kind of "peak" power. From a strictly r.f. point of view, we are still dealing with "average power" values. These should be familiar to all of us.

"Meter peak, on voice, power" is fairly self-explanatory. I have said that the a.c. meter in our lamp cord was far too sluggish to follow even the relatively slow variations of power which represented modulation. It has already been explained why power figures derived from fluctuating d.c. meters are nearly useless as an indication of amplifier performance unless correlated with other measurements. I mention this type of power again only to show the need for learning what kind of "peak power" is being used whenever the subject arises in a discussion of linear amplifiers.

Perhaps unfortunately, from one point of view, the regulations require that s.s.b. transmitter power be determined from meter swings on voice. This has the effect of keeping the pressure on an amateur to achieve more meter swing. That's fine, if it isn't done at the expense of linearity. This measuring system leads to an interesting situation. If one has an amplifier that "talks up" to a kilowatt, he wouldn't be able to whistle into the microphone without exceeding the legal limit. However, the "maximum signal power" would be the same in both cases.

Earlier I mentioned the figure 1.57 in connection with "peak" power. Never use it unless you are dealing with "two-tone" tests. What is a "two-tone" test? Just because a s.s.b. exciter is generally used as a source of signal for this linearity test doesn't mean that it is a complicated situation. Actually, two ordinary r.f. oscillators, separated in frequency by several hundred cycles and simultaneously feeding equal signals into a linear amplifier chain, would work equally well. I won't go into the reason why two steady frequencies, rather than one, are used to show distortion. However, one thing may seem strange. The average amplifier power, as read by the meter, is much less with two signals than it is with one. Due to the combination of the signals, the amplifier no longer works all the time. It has

periods of rest. The "maximum signal power" remains at full value, but the "average-reading" meter indicates far less current. If the amplifier is Class B, the meter now only reads about 64 per cent of its value for one signal of the same maximum amplitude. The reciprocal of .64 is 1.57. Thus the meter reads 1.57 times as much on a

single signal (such as carrier) as it does on a "two-tone" test. This factor only applies to Class B operation. Class AB<sub>2</sub> and Class AB<sub>1</sub> have respectively lower ratios of difference in meter readings between signals of one and two frequencies. Continuing in the same direction, Class A entails a ratio of unity because there can be no change of plate current, regardless of the type or number of signals.

From the above, one can see that the figure 1.57 should only be used in one specialized case, never when referring to voice deflection of a meter. A person can't look at a dancing plate meter and accurately see that his "maximum signal or peak envelope power" is a certain given amount. As a final check to prove that the factor 1.57 actually works out in practice, refer back to the photographs and compare the currents in Figs. 1 and 3.

### Adjustment Without a 'Scope

This isn't basically an article on linear-amplifier adjustment, but I am going to give an example to demonstrate the proper use of d.c. meters when nothing better is available. The procedure falls into the "cheap and dirty, but rather effective" class.

Before I proceed I point out that throughout this article I have mentioned only the "final amplifier." Actually, flattening and distortion may occur in any driver stage. I do not think it necessary, for our purposes, to stress meter readings and waveshapes for other stages. The indications occurring at the output of the final accurately reflect the condition of earlier stages. Of course, in actual practice it is necessary to locate and work on the weak link.

Let's say that I have an amplifier whose specs call for a plate voltage of 1500 and maximum signal current of 300 ma. (Remember, the manufacturer means on a single steady signal, not voice.) First, I insert some carrier from the exciter. I tune the grid and plate circuits to resonance as indicated by an output indicator. (Any type of output indicator connected to the feedline

(Continued on page 116)

# One Tube—80 and 40 Meters—75 Watts

*Using the 6146 as a Crystal Oscillator*

BY LEWIS G. McCOY, W1ICP

**Y**ES, the title is correct. This article describes a one-tube, two-band, crystal-controlled oscillator capable of running approximately 75 watts input. By utilizing a single tube as a high-power oscillator, the circuitry, wiring, and construction are kept as simple as possible. In addition, by making use of the "economy" power supply,<sup>1</sup> watts-per-dollar is held at a maximum. Another feature of the rig is that when the Novice graduates to the General Class ranks, the components can all be used in an all-band rig.

## Circuit Details

The "economy" power supply uses an ordinary replacement-type transformer in a bridge circuit. As can be seen from the circuit diagram, Fig. 1, the transformer rating is 350 volts each side of center tap, but the output voltage obtained is approximately 500. The supply will deliver 500 volts at 140 ma., which is adequate for the one-tube transmitter. For tune-up purposes, the output of the power supply can be switched from high to low voltage. The low potential output is 280 volts.

In order to limit the input to 75 watts, the screen voltage is held to 125 volts by  $R_1R_2$ . With the supply output switched to low voltage, the screen drops to 80 volts, convenient for tune-up purposes.

The crystal current is monitored by a 2-volt 60-ma. bulb connected between the crystal and chassis ground. The bulb also serves as a fuse, in the event the crystal current should accidentally rise above a safe value.

To avoid coil changing, a portion of the plate

<sup>1</sup>Grammer, "More Effective Utilization of the Small Power Transformer," *QST*, Nov., 1952.

• If this transmitter doesn't become a very popular design for a "first transmitter" we're going to change fortune-tellers. It has all the desirable features a Novice transmitter can have: full power, maximum watts-per-dollar, and ease of construction and operation. In fact, for any kind of crystal-controlled operation on 80 or 40 at the 75-watt level, it is mighty hard to beat. At catalog prices the cost is less than \$35, and a little judicious shopping and swapping can bring the price down still more.

coil is shorted out when 40-meter operation is desired.

## Construction

The transmitter is built on an 11 × 7 × 3-inch aluminum chassis and the 6146 and r.f. components above deck are shielded by a 6 × 6 × 6-inch aluminum box. If one lives in an area where there is no danger of TVI, the tube and other parts above chassis could be left unshielded. The controls could be mounted on a panel. However, because TVI must be considered, the construction shown here takes care of the bugaboo.

The transformer and rectifiers are mounted on the chassis top at one end. The other power supply components;  $T_1$ ,  $L_4$ , the 8- $\mu$ f. electrolytic capacitors and the 20,000-ohm 10-watt resistors, are mounted below deck.

The 6146 socket is mounted 1½ inches in from the front of the chassis and 4½ inches from the end. Two 1-inch isolantite standoffs are used to support  $L_2L_3$ , and they are mounted 2¼ inches apart. The rear one is 2⅝ inches from the chassis back and 2 inches from the side.

A row of ¼-inch holes is drilled near the bottom on both sides of the cover box to permit

Pictured is the completed 6146 rig. The plate-current indicator lamp is to the left of the tuning knob. In areas where TVI is likely to be a problem, a metal bottom plate should be used in addition to 6 × 6 aluminum box shown.

**QST for**

Bottom view of the one-tube transmitter. The 6.3-volt filament transformer is mounted on the side of the chassis at the upper right-hand corner. To the left of the transformer is one of the 8- $\mu$ f. electrolytics; the other electrolytic is not visible, being mounted behind the power-supply choke coil.

ventilation of the compartment. Several  $\frac{1}{4}$ -inch holes are also made in the box top directly over the 6146.

### Wiring

The power supply is wired first. The center taps of  $T_1$  and the high-voltage winding of  $T_2$  are connected together and soldered to the low-voltage terminal of  $S_3$ . A lead is connected from

one of the 5Y3 filament terminals to the high-voltage terminal on  $S_3$ . One lead from  $L_4$  is connected to the arm of  $S_3$ . Many Novices may wonder why the two 8- $\mu$ f. electrolytic capacitors are connected in series. This is to double the working voltage of the filter.

Next, the below-chassis portion wiring of the r.f. section is completed. The oscillator will work with less capacity for  $C_1$  but the crystal current is

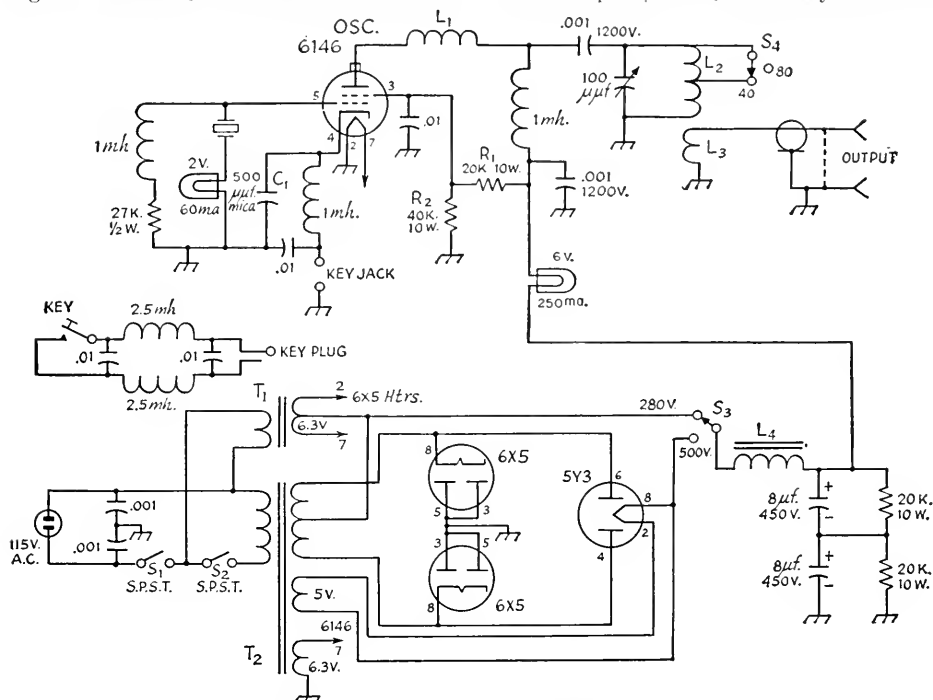

Fig. 1 — Circuit diagram of the 6146 oscillator.

$L_1$  — 1.8  $\mu$ h. (Ohmite Z-144) choke.

$L_2, L_3$  — See text and photograph.

$L_4$  — 10.5 henrys, 110 ma., 225 ohms.

$S_3$  — 1-pole 6-position (2 used) wafer switch, non-shorting (Centralab 1401).

$S_4$  — 1-pole 6-position (2 used) steatite wafer switch, nonshorting (Centralab 2501).

$T_1$  — Filament transformer, 6.3 volt, 1.2 amp.

$T_2$  — Power transformer, 360-0-360 volts, 120 ma., 6.3 volts 3.5 amp., 5 volts 3 amp. (Stancor PC8410).

Unless otherwise specified, all capacitor values are given in microfarads. Fixed capacitors except 8- $\mu$ f. electrolytics and  $C_1$  are disc ceramic.

likely to run higher than desired. No socket should be used for the 2-volt 60-ma. dial lamp in series with the crystal. A  $\frac{5}{8}$ -inch rubber grommet is used to hold the dial lamp in place. The inside diameter of the grommet is  $\frac{3}{8}$  inch, just large enough to accommodate the glass envelope of the lamp. Connections are made to the lamp by soldering leads to the base point and to the metal shell. The lead from the shell connects to the chassis.

Standard coil stock (B & W 3900, 2-inch diam., 8 turns per inch, No. 14 wire) is used for  $L_2L_3$ . A total of 38 turns is cut from the original stock. At one end of the piece, a single turn is unwound from the support bars. From this end, count up  $7\frac{1}{2}$  turns and cut the seventh turn. The cut should be made at the support bar opposite the bar from which the first lead extends. The leads from the cut point are separated from the side support bars and brought around to the same bar as the first lead. At the other end of the coil, which will be the top, a lead is unwound from the support bars and extends from the bar opposite the one with the three leads. This coil is shown in one of the photographs.

Counting from the top, the 15th and 17th turns are bent in, allowing access to the 16th turn. This is for the 40-meter tap. A four-inch length of wire can be soldered to this point. The other end will connect to the switch terminal on  $S_4$ .

The coil is supported on the isolantite standoffs by two soldering lugs. The small ends of the lugs are first bent around the bottom turn. Before soldering them in place, the large holes in the lugs should be located over the holes in the standoffs for proper alignment.

A coax receptacle is mounted on the back of the shield box and positioned so that the terminal is opposite the ungrounded end of link  $L_3$ . The switch and capacitor can be mounted in the box first and then wired. However, it will probably be easier for the beginner to wire all the components first, and then mount them in the box. Three holes are needed in the front of the shield box. The capacitor and switch holes are  $1\frac{1}{2}$  inches in from the side of the box and  $2\frac{1}{4}$  and  $4\frac{1}{2}$  inches

Close-up view of the coil construction.

from the bottom, respectively. The hole for the  $\frac{5}{8}$ -inch grommet is 2 inches to the left of the capacitor hole. With the holes cut in the box, it is easy to fit the box over the wired parts.

When mounting the glass bulb of the plate circuit 6-volt dial lamp in its grommet, be careful that none of the metal parts of the bulb base come in contact with the metal of the box. If the bulb shorted to chassis ground, the power supply might be damaged. If the builder desires, a 200- or 250-ma. milliammeter can be substituted for the bulb.

It was found in initial tests with the unit described here that a bad v.h.f. parasitic was present. This was eliminated by using an Ohmite Z-144 choke in series with the plate lead at the plate of the tube.

#### Testing the Transmitter

After the unit is wired it is ready for testing. However, before turning on the power, a key-click filter should be made up for the key. It is

# Portable Antennas for 50 and 144 Mc.

*Come-Apart Arrays for Use Away from the Home Station*

BY EDWARD P. TILTON, W1HDQ

• Mobile operation on 6 or 2 is great stuff, but if you like to work from the mountain tops, or in other choice v.h.f. spots, you'll soon come to the conclusion that you need something better in the way of an antenna system than a vertical whip. Here are portable beams for 50 and 144 Mc. that can be packed in the back of your car and still leave room for the lunch. They can be put up in your favorite location in a matter of minutes.

**E**VEN if you live at the busiest intersection or in the lowest spot in town, you can still have fun on the v.h.f. bands. Pack up your gear and antennas and head for the wide open spaces. Our spring and fall V.H.F. QSO Parties and the Annual ARRL Field Day provide week ends of concentrated v.h.f. operating, and a family picnic at any other time can be combined with an expedition to some choice v.h.f. spot.

This calls for antennas that can be erected and dismantled easily. The arrays for 50 and 144 Mc. shown here can be stowed in the back of almost any car, even with only partial dismantling. The quick method leaves the 2-meter antenna assembled, and merely involves removing extensions from the 6-meter elements. In this form the antennas and supporting mast can be assembled, ready for use in your favorite v.h.f. location in less than five minutes. If you require a smaller package, removing a few screws and folding the 2-meter elements permits packing the works in a space five feet long and about six inches square. From this stage to on-the-air might take a matter of 10 minutes, at the most.

The beams are not intended to be world-beaters. The real v.h.f. expedition enthusiast will want something better, but these antennas do surprisingly well in a good location. The 6-meter array has a driven element and director, both 3-piece elements. The 2-meter job is a cut-down TV array originally made for Channel 6. Its elements fold back against the boom, if necessary. Both antennas use gamma-match feed for either 52- or 75-ohm coaxial line.

## ***A Quick-Up Support***

A convenient support can be made from 1½-inch aluminum TV masting. Two 10-foot lengths were purchased and cut in half. One 5-foot piece was cut for the 6-meter boom and the other three are our mast. The bottom section is fastened to the door handle with a sheet aluminum clamp similar to those described for assembling all-metal v.h.f. arrays shown in all recent editions of

the *Handbook*. No dimensions are given here, as requirements are likely to be different for other makes of cars. A sample clamp can be made of stiff paper or from flashing copper, and this used as a template for making the real thing out of 3 32-inch sheet aluminum.

In the photograph only two mast sections are shown in use, but in many locations the full 15 feet may be desirable, particularly if there are low obstructions in the immediate vicinity of the car. Checks in wide-open spots have shown that there is not a great difference between the 10- and 15-foot heights otherwise. There is more variation in driven-element impedance at the lower height as the antenna is rotated, but performance is not seriously affected.

To provide a stable support without guying, the bottom of the mast must be anchored thoroughly. We usually run an old screwdriver into the ground and slip the mast over it. If the car is parked on a hard surface, the mast can be held firm by placing some large rocks around the base.

A helpful feature, added to the mast after the photograph was made, is a ¼-inch bolt 6 inches long, run through the second mast section. A piece of the half-inch element stock 4¼ inches long is slipped over the bolt when it is inserted, leaving a quarter inch for tightening the nut on

The portable 6- and 2-meter arrays ready for use. They are shown here on a 10-foot support, but another 5-foot section can be added without need for guying.

the other side of the tubing. The telescoping portions of the masting are 6 inches long. If this bolt is run through the outer tubing exactly 6 inches from the end it will provide a bearing for supporting the weight of the antenna, as well as serving as a turning handle and direction indicator. The

Close-up view of the matching device on the 50-Mc. driven element. The series capacitor and the coaxial fitting are mounted on a small U-shaped bracket. If the elements are to be removed from the boom for carrying, the screw and nut holding the connection to the matching section can be removed. The mounting clamps must also be removed from the center section of each element in this case. Ordinarily, the boom and two center sections are left assembled for carrying in the car.

latter assumes that the bolt is lined up with the booms of the antennas. The "direction indicator" is no gag. Looking up at the beam elements after dark is likely to be rather confusing.

### Beam Details

The 6-meter array was held to two elements for light weight and compact design. Even this simple antenna will be a great improvement over anything in the way of a strictly mobile set-up. Hilltop checks with horizontally polarized fixed stations indicate an average gain of 25 to 30 db. over the quarter-wave whip normally used for mobile work. If the fixed stations were vertically polarized the story would be quite different, but as practically all 6-meter work is done with horizontal beams today, the portable array enjoys a tremendous advantage over a vertical whip.

Construction follows the all-metal technique outlined in the v.h.f. antenna chapter of all recent editions of the *Handbook*. The boom, made from the leftover piece of masting, is 36 inches long. The director and driven element are 34 inches apart. They pass through the boom and are held in place by semicircular clamps of sheet aluminum. There must be solid contact between the boom and elements, otherwise reception will be noisy when the elements flutter in the wind.

We used half-inch dural tubing, but the size is not critical. Anything up to one inch can be run through 1½-inch tubing. The center sections of both elements are 36½ inches long. Two more 36½-inch sections are added to the driven element, while the director extensions are 34 inches. An alternative method would be to make the center section of the director 31½ inches long, in which case the extensions would all be the same length and interchangeable.

Inserts about four inches long, for taking the extensions, were turned down from aluminum rod. If a lathe is not available for this work, the extensions can be attached by the sleeve method outlined in all recent *Handbooks*. Pieces of the element tubing about 6 inches long are sawed lengthwise, taking out enough of the material so that the remainder can be compressed to make a tight fit inside the tubing. These are inserted into both ends of the center sections to a depth of three inches, leaving three-inch exposed portions onto which the extensions are slipped. The abrasive nature of aluminum tends to make the parts hold together tightly enough for the purpose, without fastenings, even after considerable use. The writer has used the compressed-sleeve method in portable antennas for years, and found it quite adequate for the purpose. It is most satisfactory with elements of ¾-inch or larger diameters, when the beam is for 50 Mc. or lower frequencies. Smaller diameters and thin-wall tubing are satisfactory for 144 Mc. or higher.

The 6-meter boom is held to the support by the familiar aluminum clamp. Again, as tubing sizes may vary, no dimensions are given. Suitable dimensions are arrived at most readily by the template method already outlined. The clamp assembly is held together with No. 8 machine screws, the ends of which were swaged in a vise after the nuts were run on part way. Two of the four screws required for the door-handle clamp can be swaged in this way, also, leaving only two nuts that must be removed in taking the assembly apart for ordinary carrying. If the arrays are to be completely dismantled, removal of six more screws will do the job.

The simplest way to make a 2-meter antenna is to cut down a Channel 6 TV Yagi. The one we used was originally a 5-element job having a folded-dipole radiator. The boom was too long to fit in the back of our car, so it was cut down to a 4-element antenna. The spare director element was then made into a gamma-matched dipole, which was installed in place of the folded dipole originally used for the driven element. Many TV Yagis are supplied with elements that fold back against the boom, a mechanical arrangement that is ideal for portable use. Spacing of the elements is not particularly critical. The Channel 6 spacings may be used for 144 Mc., also, though the array can be revamped to *Handbook* dimensions if you like.

Element lengths were cut to *Handbook* dimensions. As has been done many times before, we experimented a bit with adjustable elements and came to the conclusion that there was little to be gained from attempting to tune up the system, except for the matching adjustments, which will be detailed later. The length of the driven element in inches is found by dividing the number 5540 by the frequency in megacycles. The reflector is 5 per cent longer, the first director 5 per cent shorter, and the forward director 6 per cent shorter than the driven element. This applies to both the 50- and 144-Mc. arrays. Final dimensions we used were as follows: Driven element —

38 inches; reflector — 40 inches; first director — 36 inches; forward director — 35¾ inches. This gives fairly uniform performance from 144 to 146 Mc. Both gain and front-to-back ratio fall off slightly, but not seriously, above the middle of the band.

### Adjustment

Details of the gamma matching systems are shown in close-up photographs. A section of tubing or rod similar in size to the driven element is mounted on one side of the element and parallel to it with small cone stand-off insulators. An adjustable aluminum clamp makes contact between the matching section and the main element, the point of connection being moved until the best possible impedance match is achieved. A series tuning capacitor is connected between the matching section and the inner conductor of the coaxial line, to tune out the reactance of the matching section.

The gamma section is 12 inches long on the 50-Mc. array and 6 inches on the 144-Mc. one. A series capacitor of 50  $\mu\text{mf}$ . will do for either array. The spacing of the capacitor may be small, as the r.f. voltage is very low at this point. Even the smallest available capacitor, the Hammarlund type MAPC-50, is suitable for the low power generally used in portable work. If you're worried about the effects of moisture, a piece of plastic film may be wrapped around the tuning capacitors when the arrays are used in rainy weather.

There is only one way to adjust a matching system and be sure that you're doing it properly, and that is with a standing-wave bridge. The point of connection between the gamma section and the driven element should be set at about 4 inches for the 2-meter antenna or 10 inches for the 6-meter one. The series trimmer capacitor is then adjusted for minimum reflected power. If the indication will not drop to zero or very close to it, try moving the connecting clip, retuning the series capacitor for each new setting of the clip. Be sure that the clip is making a clean tight contact on each test position, or it will be impossible to obtain a good match. Good contact in the coaxial cable connectors is also extremely important. We had plenty of trouble in the initial stages of the project as the result of the outer conductor of our coax making poor contact to the connector sleeve.

A rough approximation of the correct setting can be made by adjusting the gamma match and series capacitor for maximum field-strength indication, but the field-strength meter method is the hard way. The lowest possible s.w.r. may not be too important, with the short run of coax used in a portable setup ordinarily, but the bridge method is so simple and exact that it should be used wherever possible.

### Some Random Ideas

Portable antenna design is a fruitful field for the gadgeteer, and there are countless ways the job can be done. Perhaps you want to use the

folded-dipole feed system that came on the TV antenna originally. All right, just use a coaxial balun and 72-ohm coaxial line. If the TV antenna was designed for 300-ohm feed, the balun will give you a good match.

Maybe you'd like to stack two antennas for 144 Mc. In that case, if each array has folded-dipole feed designed for 300-ohm line, space the two arrays 80 inches apart and feed through a balun at the midpoint of the open-wire phasing line. The balun and transmission line should be of 50-ohm coax in this case. This will not provide a perfect match, but it will be close enough for the purpose. If you want a better match, connect a shorted quarter-wave stub at the feed point and then slide the balun up on this stub for lowest s.w.r.

For more gain on 50 Mc., add more elements, following *Handbook* dimensions for element lengths and spacings. The gamma match arrangement will work well with any number of elements.

Your car bulges below the door handles? There are many other ways to anchor the support. WIDNE and WIVLIH use their bumper jack, tying the vertical support to the jack with webbing straps. This puts rotation of the array out of reach of car occupants, but it has the advantage of leaving all doors free.

You want to work 10 meters too? The 6-meter driven element can be made into a 10-meter di-

Details of the 2-meter gamma match. The series capacitor is mounted at right angles to the boom in this case, as adjustment is done from the side of the array instead of the end. Elements can be folded back against the boom if the array must be packed away in a small space.

pole by a little revision of the length of the center sections, so that all four extensions can be plugged together to make a dipole 16 feet long. Make the gamma section longer, in this case, to permit adjustment for 28 Mc.

Or take any of these ideas and add some more of your own. The point is that operating v.h.f. gear away from your home location in some high clear spot far from city noises is lots of fun. If you have a top-notch home-station setup, the chances are that you'll never work as far with the portable gear as you can from home, but there's something about portable operation that gets into one's blood, even so. Try it, and see!

# The Automobile Storage Battery and Its Charging System

## *Principles and Limitations of Car Power Plants*

BY DONALD MIX, WITS

• The success of any mobile installation depends to a large extent upon intelligent use and maintenance of the car's storage battery and charging system. Included in this article is a discussion of the principles of charging-regulator circuits.

**E**LECTRICAL power for motor cranking and for operating lights and accessories in a car when the motor is idle is furnished by a storage battery. Unlike a dry battery, which must be replaced when it is discharged, the storage battery may be recharged hundreds of times before its useful life is ended. The charging is done automatically when the engine is running by means of a generator belt-driven from the crankshaft of the motor.

The storage battery is made up of units consisting of a pair of coated lead plates immersed in a solution of sulphuric acid and water. The basic unit delivers a nominal voltage of 2. The number of watt-hours (watts  $\times$  hours) that may be drawn from the battery before recharging is necessary is increased by enlarging the plate area and by connecting units in parallel. Such an assembly is called a cell. Cells, each of which delivers about 2 volts, can be connected in series to obtain the desired battery voltage. A 6-volt battery therefore has three cells, and a 12-volt battery has 6 cells. The average stock car battery has a rated capacity of 600 to 800 watt-hours, regardless of whether it is a 6-volt or 12-volt battery. Special heavy-duty batteries with larger capacities are available.

### *Specific Gravity and the Hydrometer*

The electrical power delivered by a storage battery is a result of chemical action between the sulphuric acid in the solution (electrolyte) and the lead plates. As power is drawn from the battery, the acid content of the electrolyte is reduced. The acid content is restored to the electrolyte (meaning that the battery is recharged) by passing a current through the battery in a direction opposite to the direction of the discharge current. The positive terminal of the charger is connected to the positive terminal of the battery. The positive terminal of the battery is usually identified by a  $+$  mark and is of slightly greater diameter than the negative terminal.

Since the acid content of the electrolyte varies with the charge and discharge of the battery, it is

possible to determine the state of charge by measuring the specific gravity of the electrolyte. Specific gravity is the ratio of the weight of a unit volume of electrolyte to the weight of an equal volume of water.

An inexpensive device for checking the s.g. is the hydrometer which can be obtained at any automobile supply store. The hydrometer consists of a calibrated glass float within an outer glass tube that is fitted at one end with a rubber suction bulb, and with a rubber nozzle at the other. Each cell of the battery has a removable cap giving access to the electrolyte. In checking the s.g., enough electrolyte is drawn out of the cell and into the hydrometer so that the calibrated bulb floats freely without leaning against the wall of the glass tube. The hydrometer should be held in a vertical position at eye level and a reading taken at the surface level of the electrolyte.

Care should be taken in using the hydrometer because the acid is harmful to the skin and clothing as well as to battery terminals and metal parts of the car. The electrolyte should be returned to the cell after testing. Each cell should be tested in turn.

While the readings will vary slightly with batteries of different manufacture, a reading of 1.275 should indicate full charge or nearly full charge, while a reading below 1.150 should indicate a battery that is close to the discharge point. More specific values can be obtained from the car or battery dealer.

These readings are normal for an electrolyte temperature of 80 degrees F. For extremes of temperature, 0.004 should be added to the reading for each 10 degrees of temperature above 80 degrees, or subtracted for each 10 degrees below 80 degrees. Some hydrometers have built-in thermometers that simultaneously check the temperature of the electrolyte. The

s.g. reading of all cells in a battery should be alike within 0.025.

Readings taken immediately after adding water, or shortly after a heavy discharge period will not be reliable, because the electrolyte will not be uniform throughout the cell. The battery

Fig. 1—Sketches of the hydrometer showing (A) the position of the calibrated float when the battery is near full charge, and (B) when the battery is almost completely discharged.

should be allowed to stand for several hours before taking the reading. Charging will speed up the equalizing, and some mixing can be done by using the hydrometer to withdraw and return some of the electrolyte to the cell several times.

A battery should not be left in a discharged condition for any appreciable length of time. This is especially important in low temperatures when there is danger of the electrolyte freezing and ruining the battery. A battery discharged to an s.g. of 1.100 will start to freeze at about 20 degrees F., at about 5 degrees when the s.g. is 1.150 and at 16 below when the s.g. is 1.200. There should be no danger of freezing if the s.g. is kept at 1.250 or higher.

If a battery has been run down to the point where it is nearly discharged, it can usually be fast-charged at a battery station. Fast-charging rates may be as high as 80 to 100 amperes for a 6-volt battery. Although a discharged or nearly discharged battery cannot be brought back to full charge by fast charging, it can be brought back to useful condition within a short time. Any 6-volt battery that will accept a charge of 75 amperes at 7.75 volts during the first 3 minutes of charging, or any 12-volt battery that will accept a charge of 40 to 45 amperes at 15.5 volts, may be safely fast-charged up to the point where the gassing becomes so excessive that electrolyte is lost or the temperature rises above 125 degrees. If the battery requires more than the above values of

voltage to produce the currents specified, fast-charging should be done with caution to avoid excessive heating.

A normal battery showing an s.g. of 1.150 or less may be fast-charged for 1 hour. One showing an s.g. of 1.150 to 1.175 may be fast-charged for 45 minutes. If the s.g. is 1.175 to 1.200, fast-charging should be limited to 30 minutes.

### Care of the Battery

The battery terminals and mounting frame should be kept free from corrosion. Any corrosive accumulation may be removed by the use of water to which some household ammonia or baking soda has been added, and a stiff-bristle brush. Care should be taken to prevent any of the corrosive material from falling into the cells. Cell caps should be rinsed out in the same solution to keep the vent holes free from obstructing dirt.

All connections to the battery and along the battery line to the starter and transmitter should be inspected regularly for loose or corroded connections. Battery terminals and their cable clamps should be polished bright with a wire brush, and coated with mineral grease. Solid connections and adequate cable size in the battery circuit are of great importance. A 150-watt load on a 6-volt battery represents a load resistance of only  $\frac{1}{4}$  ohm. If connection and lead resistances amount to as much as  $\frac{1}{4}$  ohm, the power delivered to the load will be only one fourth of that delivered with zero loss resistance, and only half of the power actually drawn from the battery will be dissipated in leads and connections.

The hold-down clamps and the battery holder should also be checked occasionally to make sure that they are tight so that the battery will not be damaged by pounding when the car is in motion.

### Voltage Checks

Although the readings of s.g. are quite reliable as a measure of the state of charge of a normal battery, the necessity for frequent use of the hydrometer is an inconvenience and will not always serve as a conclusive check on a defective battery. Cells may show normal or almost normal s.g. and yet have high internal resistance that ruins the usefulness of the battery under load.

When all cells show satisfactory s.g. readings and yet the battery output is low, service stations check each cell by an instrument that measures the voltage of each cell under a heavy load. No-load voltage measurements usually are meaningless because it requires a large current to detect the difference in internal resistance between a normal cell and one that is defective. Under a heavy load the cell voltages should not differ by more than 0.15 volt.

A load-voltage test can also be made by measuring the voltage of each cell while closing the starter switch with the ignition turned off. In many cars it is necessary to pull the central distributor wire out to prevent the motor starting.

If the battery is down so far that it will not turn the cranking motor, this voltage check can still be made. The average cell of a fully-charged battery on discharge while cranking should measure about 1.95 volts at 80 degrees, or 1.4 volts at 0 degrees. A defective cell will show up quite readily by a voltage reading noticeably below the readings of the other cells.

As the normal battery approaches discharge, its internal resistance increases so that the difference between no-load and loaded voltages becomes greater. A d.c. voltmeter with a scale of 10 for a 6-volt system, or 25 for a 12-volt system, mounted on the instrument panel and connected to the battery terminals, may be used to provide a continuous check on the condition of the battery. The most significant readings, of course, will be those made with the transmitter operating and with the car motor turned off. Experience will show the normal drop in battery-terminal voltage to be expected when the transmitter load is turned on. Voltage readings can be correlated with readings of specific gravity so that eventually the operator should be able to estimate the state of charge of the battery with only an occasional check with the hydrometer.

### Electrolyte Level

Water is evaporated from the electrolyte, but the acid is not. Therefore water must be added to the solution in each cell from time to time so that the plates are always completely covered. Since the introduction of the charging regulator several years ago, the most frequent cause of subnormal battery life is failure to maintain proper electrolyte level. The level should be checked at least once per week, especially during hot weather and constant operation.

Distilled water is preferred for replenishing, but clear drinking water is an acceptable substitute. Too much water should not be added, since the gassing that accompanies charging may force electrolyte out through the vent holes in the caps of the cells onto the surface of the battery. The electrolyte expands with temperature. If a battery is replenished when the electrolyte is at 80 degrees, the level may fall off as much as  $\frac{3}{16}$  inch when the temperature drops to 0 degrees. Conversely, if the electrolyte is replenished at 0 degrees, the cell may overflow at higher temperatures.

*Do not use an open flame when inspecting the electrolyte level, since the chemical action develops hydrogen gas which is highly explosive.*

### Cranking Power

It requires about 65 per cent more power to crank a motor at 32 degrees than at 80 degrees, and about 250 per cent more at 0 degrees. At the same time, the cranking power delivered by a fully-charged battery at 32 degrees is reduced to about 65 per cent of that delivered at 80 degrees, and to about 40 per cent at 0 degrees. A cranking motor will draw from 125 to 300 amperes at 6 volts in summer and 300 to 700 amperes in winter.

### Auxiliary Charging

Because a car may not be driven sufficiently to keep the battery charged, auxiliary charging from an external source may be required from time to time. Battery chargers of various types are on the market and can be installed in the garage so that the battery can be charged during the night. It is not necessary to remove the battery from the car. A battery is fully charged when the electrolyte shows no increase in s.g. over a 3-hour period.

### Battery-Charging System

In the normal stock installation, the car battery is charged by a d.c. generator driven by a belt from the motor crankshaft. The output of the generator is governed by a regulator usually consisting of three relays.

The cutout relay is for the purpose of disconnecting the generator from the battery when the generator is not operating, to prevent the battery discharging through the generator windings. The contacts of the cutout relay are in series with the ungrounded wire between the generator output (armature) terminal and the battery. When the car motor turns the generator over at sufficient speed to develop a voltage greater than the battery voltage, the contacts close and the generator is connected to the battery. When the motor is slowed down, and the generator voltage falls below the battery voltage, the contacts open, disconnecting the generator from the battery.

The current-regulator relay is for the purpose of protecting the generator against overload. Its contacts are connected across a resistor in series with the field winding of the generator. When the load on the generator exceeds the current value to which the regulator has been set, the contacts open and close, intermittently inserting the resistor in series with the field winding at a rate that limits the average output current to a

value that is safe for the generator to handle. Some older-model cars do not have this current-regulator unit.

The purpose of the voltage-regulator relay is to assure adequate battery charging, while preventing damage to the battery from overcharge. Its contacts are also connected across a resistor in series with the field winding of the generator. When properly adjusted, it will regulate the average generator output voltage so as to cause the battery charging current to rise to a value near the maximum safe limit set by the current regulator, and taper off almost to zero current as the battery nears full charge. The life of the battery is highly dependent upon proper adjustment of the voltage regulator.

The design, operation and adjustment of charging regulators vary appreciably among the various makes and models. Proper adjustment requires special data, gauges and instruments not often in possession of anyone but qualified electro-motive service shops. The critical setting of several spacings according to manufacturer's specifications is required. It is seldom a simple matter of tightening or loosening the tension of a spring. An amateur who makes a mobile installation should ask the service shop to check the adjustment of the current regulator to make sure that it is set for the maximum output current for which the generator is rated. This will permit maximum safe output from the generator when operating from the car motor, and will allow maximum control of the charging rate by the voltage regulator.

In general, there is little to be gained by a readjustment of the voltage regulator from its original proper setting, although it would be well to have a service chop check the adjustment periodically to maintain the proper adjustment. Voltage-regulator operation depends to a large extent upon the difference between the battery and generator voltages at any given time. So long as the load current drawn does not exceed the current limited by the current regulator, the battery voltage will be unaffected, and the voltage regulator will control the battery charging current in the normal way. If, however, the total current drawn from the system exceeds the current for which the current regulator is set, the current from the generator will be limited by the current regulator, not by the voltage regulator, and the extra current will be drawn from the battery.

When the external load is removed, the voltage regulator will act in normal fashion, causing the charging current to rise to maximum until the battery is again near full charge. Setting the voltage regulator to a higher limiting voltage will not speed up the recharging, because the charging current is limited by the current regulator to a value that is safe for the generator, as mentioned previously. Increasing the limiting voltage of the voltage regulator will, however, result in continued charging at an excessive rate after the battery has reached full charge, and this can cause reduced battery life.

## NEW BOOKS

**Yagi-Uda Antenna**, by Shintaro Uda and Yasuto Mushiaki, Tohoku University, Japan. Published by Sasaki Printing and Publishing Co., Ltd., 27 Tsutsumi-dori, Sendai, Japan. Obtainable from Zeitlin & Ver Brugge, 815 N. La Cienega Blvd., Los Angeles 46, California. 183 pages, including index. Schematics.  $6\frac{1}{4} \times 8\frac{1}{2}$  inches. Cloth cover. Price, \$4.00.

This is no doubt the most complete discussion of the parasitic beam originated by Dr. Yagi yet published. The first five chapters are on antenna theory, including treatment of the equivalent radius of various forms of conductors in linear antennas, mutual impedance of parallel antennas, antennas with discontinuous thickness, and the general theory of the Yagi. The remainder of the book — it has thirteen chapters in all — is largely given to the practical design of two- and three-element beams, with sets of graphs useful for design purposes.

— — —

**Television for Radiomen**, revised edition, by Edward M. Noll. Published by The Macmillan Company, 60 Fifth Ave., New York 11, N. Y. Part I, black and white, Part II, color television. Part I, 662 pages, Part II, 108 pages.  $6\frac{1}{2} \times 9\frac{1}{4}$  inches. Price, \$10.00.

This is a comprehensive, descriptive text covering modern television circuits and their operation. Intended as a course for technicians as well as a reference manual, it is distinctly practical in approach and largely nonmathematical in treatment. (A separate chapter on "Practical Television Mathematics" collects the design formulas most frequently used in circuit work.) The revised edition now includes sections on u.h.f. and color.

August 1930

... The "Old Man," describing the Wouff Hong, tells that since the beginning of amateur radio it has meant "the one or the other" — either law and order or the Wouff Hong!

... Harry Wells, W3ZD, relates his exciting operating experiences with the *All-American Lyric Malaysian Expedition* to Borneo. The call used was PMZ.

... "The First Conviction Under the Radio Act," by Porter H. Quinby, W9DXY, tells how St. Louis amateurs cooperated in running down an unlicensed station.

... In "Dummy Antennas," by Guy C. Omer, Jr., W9EBF/W9FSC, a description of a modern dummy load is presented. It incorporates a variable capacitor and iron wire wound on strips of wood.

... ARRL Headquarters station W1MK operates on 3575 and 7150 kc.

... "The Third International Relay Competition," by E. L. Battey, gives a run-down of results of this popular contest. Hats off to W6BAX who hit the jack pot with a sizzling 3210.

... W9DRD gives the low-down on 7-Mc. crystals, the youngest useful members of the piezo family, in this month's Experimenters' Section.

... A pioneer 14-Mc. 'phone station, W9ANZ, Louis F. Leuck operator, is the station of the month. Using a Type '03A in the final and a UV-211 in the modulator, W9ANZ emits an "ear-busting" signal.

# Revision of 6-Volt Equipment for 12-Volt Operation

UNFORTUNATELY, there is no simple and inexpensive way of converting existing 6-volt mobile installations for operation in the newer cars having 12-volt battery and charging systems.

The simplest solution is provided by a dynamotor that has 12-volt input and 6-volt output. Such a dynamotor is produced by the Carter Motor Co., and is called the "Change-a-Volt." It is rated at 15 amperes, 6 volts output continuously for receiver operation, and 45 amperes intermittently for transmitter use. The cost of this unit, however, is comparable with that of a new power unit for 12-volt input. There is also, of

models in each type that are designed for either 6- or 12-volt input. It would be advisable for anyone now contemplating an installation in a car with a 6-volt system to purchase one of the dual-input types to cover future use with a 12-volt system.

## Filaments

You may be lucky enough to find 12-volt equivalents for all of the 6-volt tubes in your installation, but this will rarely be the case. The simplest and most efficient filament conversion consists of dividing the 6-volt tubes into two groups totaling, as closely as possible, the same current. The two groups are then connected in series, as shown in Fig. 1. If the two branches cannot be matched exactly, a resistor should be connected across the branch of lesser current to make the total current of this branch equal the total current of the other. The value of the resistor in ohms should be

$$R = \frac{6.3}{I_1 - I_2},$$

where  $I_1$  is the greater total current and  $I_2$  the lesser, in amperes.

This system can be applied to any number of tubes greater than 1. A single tube will, of course, require a simple series resistor, as shown in Fig. 1B. The value of this resistor in ohms should be

$$R = \frac{6.3}{I},$$

where  $I$  is the rated filament current of the tube in amperes.

In this revision of the filament wiring, it is obvious that only one side of one group of filaments may be grounded to the chassis. One side of this group and *both* sides of the second group must be insulated from the chassis. — D.H.M.

(A)

(B)

Fig. 1 — (A) — Showing the connection of 6-volt heaters in series-parallel for 12-volt operation.  $R_1$  is used to equalize the currents in the two branches. (B) — A single 6-volt heater will require a series resistor,  $R_2$ , for 12-volt operation.

course, a loss of power in the conversion from 12 to 6 volts.

Both dynamotors and vibrator packs are available from 12-volt input, and there are some

- Most makes of cars are turning to the use of 12-volt electrical systems. This is a definite advantage for heavy loads, such as mobile transmitters. Here are suggestions for operating 6-volt equipment from 12-volt systems.

# A Six-Meter Club Project

## Andrews Electronic Association Builds 50-Mc. Gear on Production-Line Basis

BY JOHN P. DRUMMOND,\* W3YHI

THE Andrews Electronics Assn., Andrews Air Force Base, Md., recently took on the construction of 6-meter rigs as a club project. As a result, eleven stations are making their 50-Mc. debut near Washington, D. C. All but one are entering the v.h.f. ranks through this project, and more are expected to follow shortly.

This work was undertaken as a result of many factors. Members had long agreed that a project was needed to stimulate club interest. There were as many ideas as to what its nature should be as there were club members. Opening of the 6-meter band for Technician operation was then in prospect. AEA had previously considered a 2-meter project to provide improved local communications for the club's "Windbagger's Net" but there was obvious need for more activity on 50 Mc. Previous club experience in sports car races and in providing communications of an emergency nature had emphasized the need for more suitable equipment. The v.h.f. bands appeared to provide the best solution, but none of the equipment owned by the members could be used for v.h.f. work. The 50-Mc. band seemed like the optimum frequency, as it would be easier to construct equipment and better local range could be expected with simple antennas than on 144 Mc. Then there was the technical challenge of potential TVI with fringe-area reception of Channel 2 from Baltimore. AEA's previous stand had been in favor of opening both 2 and 6 meters to Technicians. Although AEA opposed the ARRL position against opening 144 Mc. to Technicians, it accepted the League's decision and was prepared to support the will of the majority actively.

The usual problems were involved in getting a group to tackle a new problem. Again there were nearly as many ideas as members. Some were not interested in 50 Mc.; some had no construction experience; others had no place to work. A questionnaire was made up to determine the general characteristics of the equipment desired by the majority and their willingness to assist each other in a cooperative production-line assembly project. The writer was given the task of designing and building a pilot model of the transmitter. The poll of the members had indicated that a unit of 15 to 20 watts input was desired. It was to be of simple design, rugged, and inexpensive to build, as each member was to pay for his own.

The model transmitter was built and a major portion of one meeting was devoted to an "on-

the-air" 50-Mc. session with W3OJU, during which Rick did an excellent job of answering questions thrown at him by the AEA membership. The thoroughness of W3OJU's sales talk was proven that same night when AEA voted to proceed without delay.

For economy reasons, the transmitter was designed largely around parts stripped from AN/ARC-4s, as we had a source of these units. The final design met the simplicity requirement. It employed a 12AT7 overtone oscillator-doubler driving a 2E26 final amplifier. The modulator is a pair of 6L6s driven directly from the microphone transformer. Input runs around 20 watts. A list was made of the parts and tubes which had to be purchased.

Ten members immediately indicated the desire to build similar transmitters and they put their cash on the line to prove it. The base hobby

The finished product, a 50-Mc. transmitter complete with modulator. The r.f. section is similar to *Handbook* design, but modified to make use of available surplus parts. (USAF photos)

\* % Hq., AACs, AAFB, Washington, D. C.

Members of the Andrews Electronics Assn. who participated in the 50-Mc. transmitter construction project. *Front row, l. to r.:* WN3ZTA, W3URQ, W3RV, W3HGY, M. P. Hixson. *Middle row:* WN3ALG, W3YQV, W3YHI, Major Gikas, W3VBE. *Standing:* W0DDC, W3TPT, W3-WWQ, W3ZQD, W3UBZ, W0QBK.

shop was selected as a site for construction, and one member was nominated to purchase the parts. Special meetings were set up for every Friday night to carry the construction through to completion. The meeting then adjourned and the committees swung into action.

Sufficient ARC-Is were rounded up to provide the parts sources. The writer drafted a step-by-step instruction sheet for removal of the parts to be used, and both were distributed among the members in advance. To the amazement of those who felt that the project would not catch on, more than 75 per cent of the membership showed up the first night, loaded with tool boxes and ready to work. Club Prexy W3TPT staggered in bearing a large carton with the purchased parts and announced that he'd cleaned the local dealers out. The final cost per transmitter was less than \$10.

Workers were assigned to places in a production line headed by W3VBE, who had previously made a template for the chassis. Hacksaws, drill presses and soldering irons were manned and we were under way. The chassis work (usually the toughest construction job) was accomplished in a surprisingly short time as a result of the production-line techniques and the availability of willing hands. All chassis were then run back down the line for the mounting of parts and prefabricated assemblies which had been prepared by other members. Wiring was done by following simple step-by-step instructions prepared by the writer in the manner used by the Heath Co. for their kits.

Although this project is not at this writing fully completed, it has caused considerable comment in the Washington area. A number of requests have been received for information on the transmitter design, method of starting the project, etc. Certainly AEA can expect some TVI cases to pop up, but they will be sought out and treated as necessary. A club project of this sort for 50 Mc. is not, in itself, new. Nothing new in the way of equipment development resulted

from this one. AEA feels, however, that the project has accomplished several very worthwhile things to date. It has proven that a club can take on a project type that is new to its members and in doing so draw the members closer together in the common cause. It has also proven our democratic principles of majority rule can be accepted with good grace and that unity can exist within the amateur ranks — even among those who “lost” an issue.

We'll be seeing you on 50 Mc.

## Silent Keys

IT is with deep regret that we record the passing of these amateurs:

### The Viking Adventurer

THE "Adventurer" is a small transmitter which, while no doubt having special appeal to Novice licensees because it is crystal-controlled and operates at a 50-watt final-amplifier input level, also would be useful as an exciter for a higher-power amplifier in the 3.5- to 28-Mc. bands. The power output should be ample for driving a tetrode of fairly large power input. The aluminum cabinet has been designed for good

passive coupling to the 807 grid is used in the oscillator plate circuit. The 807 plate tank is a pi network with constants selected so that loads ranging 50 to 600 ohms can be fed. In both tanks the various bands are covered by tapped tank coils, the unused portions of which are shorted out by the bandswitch. Both coils are sectional-wound to reduce the coupling between the active and shorted portions and thus minimize losses in

»

The "Adventurer" is a two-tube 50-watt input transmitter covering the amateur bands between 3.5 and 30 Mc. The dual-range milliammeter (0-20 and 0-200 ma.) can be switched to read either grid current or plate current in the final amplifier. The control at the upper right is for the 700- $\mu$ f. variable output capacitor of the amplifier pi network. The slide switch just below it cuts a 700- $\mu$ f. fixed capacitor in parallel for additional output capacitance.

»

«

The oscillator and amplifier tank coils are wound on ceramic forms, with sections for the various bands separated as shown to reduce losses. The higher-frequency sections are space-wound. The phono-type connector at the left on the rear lip of the chassis is for coaxial output from the amplifier tank.

«

shielding and the 115-volt and keying leads (the only ones that have external connections) are fitted with harmonic filters for the TV frequencies. The transmitter is available only in kit form, and the only accessories required are a key and crystals.

There are two r.f. tubes, a 6AG7 oscillator and 807 amplifier/doubler. The oscillator uses the Pierce-type circuit with the crystal connected between grid and screen, output being taken from the plate. Conventional parallel tuning with ca-

the "dead" turns. The oscillator and amplifier switch sections are ganged, but are separated by a shield partition to prevent unwanted coupling between the two circuits.

In the main, the r.f. circuits conform to standard practice and are quite straightforward. The oscillator operates straight-through on the 3.5-Mc. band, 80-meter crystals being specified (although presumably a 160-meter crystal could be used for this band if one happens to be available). For 7-Mc. operation, either 80- or 40-meter crys-

tals may be used, with frequency doubling in the oscillator plate circuit in the former case. Forty-meter crystals are recommended for 14-Mc. and higher-frequency operation; the oscillator doubles for 14-Mc. operation, triples for 21 Mc., and doubles for 27-28 Mc., where the 807 is also used as a frequency doubler. On 21 Mc. and all lower-frequency bands, the 807 operates as a straight-through amplifier. Since the driving power tends to become excessive on the lower frequencies, a 2700-ohm 1-watt resistor is connected between the 21-Mc. tap and the cold end of the oscillator tank coil (shorting for the higher frequencies moves progressively from the cold end) to absorb some of the excess power. This arrangement results in reduced "swamping" by the resistor on 14 Mc. particularly, and cuts out the additional loading entirely on 21 Mc.

Simultaneous cathode keying of both tubes is used in the "Adventurer." There is no built-in provision for shaping of the keying waveform. VFO-input terminals are provided, connecting

between the 6AG7 stage grid and ground.

Plate and heater power are both obtained from the same power transformer. The rectifier is a 5U4G, working into a capacitor-input filter consisting of two capacitors and a choke. The output voltage is approximately 450 at a full-load current of 150 ma. Power leads are brought out to an octal socket on the rear chassis apron so the power supply can be used for other purposes if desired. The transmitting tubes remain connected under these conditions, but the full d.c. output is available for external use if the key is left open. To use the maximum available heater current of 2 amperes externally requires removing the oscillator and amplifier tubes from their sockets. The same "accessory" socket can be used to operate a device of low power consumption, such as a VFO, with the transmitter in full operation.

The panel size is  $7\frac{3}{8}$  by  $10\frac{3}{8}$  and the transmitter is  $8\frac{1}{8}$  inches deep. Like other Viking units, the "Adventurer" is a product of the E. F. Johnson Company. — G.G.

## Models 650 and 651 Matchmasters

THE B & W "Matchmaster" is a piece of test equipment incorporating a dummy antenna, standing-wave ratio bridge, and r.f. power meter in one unit. It is made in two impedance levels matching the two commonly-used types of coaxial line, Model 650 being set up for 52-ohm lines and Model 651 for 73-ohm lines. The dummy antenna, which uses noninductively-wound wire resistors, has a continuous rating of 100 watts and an intermittent rating of 125 watts. Power in the dummy antenna is measured by means of a rectifier-type voltmeter, using a 1N34, connected through a voltage divider across the dummy load.

The essentials of the dummy antenna and s.w.r.-bridge circuits are shown in the accompanying diagram, in which the power-reading voltmeter and switching details have been omitted. One interesting feature is the compensating cir-

cuit for the dummy load, consisting of  $L_1$  (2 spaced turns  $\frac{3}{4}$  inch in diameter) and the 100- $\mu$ mf. variable capacitor. The purpose of this circuit is to reduce reactive effects, particularly at the high-frequency end of the useful range of the instru-

Basic circuit of the "Matchmaster" dummy antenna and s.w.r. bridge.

The "Matchmaster" is a combination of dummy antenna, r.f. wattmeter, and s.w.r. bridge, and is useful for testing and adjustment of transmitters and antenna systems. Dimensions are  $8\frac{1}{4}$  by  $8\frac{1}{4}$  by  $6\frac{1}{4}$  inches.

ment, and to provide a means for adjusting the resistance to the proper value. The adjustment is an internal one and is made at the factory.

The s.w.r. indicator uses the well-known resistance-bridge circuit.  $R_1$ ,  $R_2$ , and  $R_3$  are equal resistors having a value the same as the characteristic impedance of the line to be matched.  $R_4$  and  $R_5$  are identical and are of high value compared with the other three,  $R_4$  being used to isolate the d.c. meter circuit from the r.f. bridge, and  $R_5$  to balance the shunting effect of  $R_4$ . The 10,000-ohm variable resistor is for setting the meter sensitivity to conform to the power taken from the transmitter. The instruction book states that power inputs between 10 and 100 watts will permit proper operation of the bridge.

An innovation in the bridge circuit is the use of a ballast lamp,  $RT$ , to maintain the r.f. voltage applied to the bridge at a reasonably-constant

»

Inside view of the "Matchmaster."  
Six noninductive wire-wound resistors in parallel form the dummy antenna. The variable capacitors at the lower right are used in frequency-compensating circuits for the dummy antenna and wattmeter voltage-divider.

»

value when different loads are connected to the output terminals. The ballast, a GE 15-watt 120-volt miniature-base lamp, would seem to be a worth-while addition to such a bridge when no other means is used for keeping the input voltage constant (the importance of this has been stressed many times in both *QST* and the *Handbook*, when reasonable accuracy is to be attained in s.w.r. measurement).

A three-position switch is used for the various functions. In one position the d.c. instrument, a 0-1 milliammeter, is connected to the line r.f. voltmeter for power measurement. In this position the s.w.r. bridge and output connector are disconnected. In the second switch position both the dummy load and s.w.r. bridge are connected to the input terminals and the milliammeter is switched to the bridge-indicator circuit, while the output terminals are still disconnected. This posi-

tion permits adjusting the meter reading to full scale for subsequent s.w.r. measurement. The third switch position adds a connection between the bridge and the output terminals, giving the s.w.r. reading. Since the dummy antenna is permanently connected in all three switch positions and the s.w.r. bridge is of the low-power type, the "Matchmaster" cannot be left in the line after tests and adjustments have been made.

The dummy antenna is specified to have a standing-wave ratio of 1.2-to-1 or less at all frequencies up to 30 Mc., and the power meter will give useful readings at frequencies between 500 kc. and 30 Mc. — *G.G.*

## A.R.R.L. QSL BUREAU

The function of the ARRL QSL Bureau system is to facilitate delivery to amateurs in the United States, its possessions, and Canada of those QSL cards which arrive from amateur stations in other parts of the world. Its operation is made possible by volunteer managers in each W, K and VE call area. All *you* have to do is send your QSL manager (see list below) a stamped self-addressed envelope about 4½ by 9½ inches in size, with your name and address in the usual place on the front of the envelope and your call printed in capital letters in the upper left-hand corner.

W0, K0 — Alva A. Smith, W0DMA, 238 East Main St., Caledonia, Minn.  
VE1 — L. J. Fader, VE1FQ, 125 Henry St., Halifax, N. S.

# What About the Low-Frequency Harmonics?

*A Serious Problem for the Amateur Newcomer*

BY CHARLES L. WOOD,\* W2VMX

• Although most hams these days worry about TVI from their v.h.f. harmonics, W2VMX points out that even more serious trouble can be caused by the low-order (second, third, etc.) harmonics that may interfere in channels used by important communications services. This should be of special significance to the Novice working on the 80- and 40-meter bands, since the second harmonics fall outside the bands assigned to amateurs.

THE problem of harmonics in amateur radio is by no means limited to the matter of TVI. The v.h.f. harmonics which so irk the XYL and the neighbors have simply received more attention in recent years. Yet there are many hams on the air today radiating strong signals, outside amateur bands, that do *not* bother TV sets. Too often, the first inkling of trouble in these cases is a letter from the FCC. ARRL Official Observers are sending many post cards to amateurs in this category. It is sincerely hoped that this service will save many hams from FCC notices. Our station alone has sent cards to several *hundred* different amateurs heard outside amateur bands in the last few years.

If you would have first-hand knowledge of the situation, sweep the spectrum from 7350 to 7500 kc. on any Sunday afternoon. We have heard harmonics so thick in this region that some stations couldn't be copied because of harmonic QRN from others.

Granted that a problem exists, what are we going to do about it? Let's begin by asking where this unwanted energy comes from. A *harmonic* frequency is simply an integral multiple of some given frequency called the *fundamental*. For instance, if your transmitter operates on 3705

kc., the second harmonic is at 7410 kc., and the third is at  $3 \times 3705$  or 11,115 kc. Regardless of the kind of transmitter you use, whether homemade or store-bought, small amounts of energy at these harmonic frequencies are present in your final tank along with the useful energy at the fundamental frequency. Such energy can create problems whenever (1) there is a large amount of harmonic energy generated or (2)

when conditions exist under which the harmonic energy may be easily radiated. Either condition alone may be bad; the combination is an invitation for FCC action.

The files of our station contain quite a number of letters and comments from the stations to whom we have sent ARRL Official Observer cards. These letters show that the chief reasons for the harmonics we have heard are, in order, carelessness, ignorance of the situation, and the inability to correct the problem. Let's go through the most common mistakes and see whether we can avoid these pitfalls.

## *Use a Wavemeter*

The first question in chasing low-frequency harmonics should be this: To what band is the final tank circuit tuned? Many Novices are building bandswitching rigs. Many others have built rigs in which the final tank capacitor, without any change in the tank inductor, will tune, for instance, to both 3.7 and 7.4 Mc. In the case of the bandswitching transmitter, the danger always exists that the operator will, without thinking, leave a 3.7-Mc. crystal in place when the bandswitch is turned to the 7-Mc. band. A frequency-doubling action takes place and the full output of the transmitter is then radiated on a frequency outside the amateur bands. In the case of the transmitter which will tune both bands without replacing the inductor, the operator must at all times *beware* of the resonance point which uses the *lesser* capacitance

\* 609 Park Ave., Collingswood 7, N. J.

of the tuning capacitor. A special case of this same trouble may exist where the transmitter is operated from a crystal or VFO in the 160-meter region. In such a transmitter it is sometimes possible to tune a multiplier stage to the third harmonic around 5.4 Mc., instead of the intended second harmonic near 3.7 Mc. Again, it sometimes happens that the output of a doubler stage tuned to 3.7 Mc. may contain sufficient energy at 5.4 Mc. to drive a final so that it will show a pronounced dip at resonance at 5.4 Mc.

What can be done to make sure the final is tuned to the right band? The FCC regulations provide that the frequency of the transmitter must be checked from time to time. Unfortunately, we can't rely on the receiver to tell us about harmonics. If we have a 3.7-Mc. transmitter right next to the receiver, we will probably hear a signal every 3.7 Mc. right up the dial. The instrument we need to be sure of the right band is called a wavemeter. An excellent unit that can be built for just a few cents was described in *QST* recently, complete with a cut-out dial.<sup>1</sup> A more elaborate and more sensitive instrument was described by another author

in the February issue of this year.<sup>2</sup> The latter can be used to indicate the presence of very small amounts of harmonic energy at 5.4 and 11 Mc.

### Tank-Circuit Q

If we find that the final tank is not tuned to the right band, the necessary correction is easy enough. If the tank is tuned to the right place but there is enough unwanted energy to give an indication on the wavemeter, this is another problem. Then we must find out whether the unwanted signal is coming from the final or from some previous stage. Always correct the trouble on the lowest power level.

High-Q tank circuits will minimize harmonics in lower-level stages. Harmonic generation in amplifier stages can be minimized by reducing drive to the lowest practical level. Consult

<sup>1</sup>Smith, "The Measuring-Cup Band-Spotter," *QST*, Sept., 1952.

<sup>2</sup>McCoy, "The Baking-Pan Wavemeter," *QST*, Feb., 1955.

<sup>3</sup>Also see McCoy, "A 5-Band Antenna Coupler," *QST*, April, 1955.

<sup>4</sup>Although the minimizing of the number of turns in the link coils is desirable in reducing harmonic output, it has been pointed out previously in *QST* that adequate output coupling sometimes requires a larger link winding than that supplied by coil manufacturers. This is particularly true when working into higher-impedance lines, such as 300-ohm Twin-Lead. — Ed.

the *Handbook* for proper grid drive, and do not exceed this figure. These are just two of the ways to help cut harmonic generation in the transmitter. After we have worked on this angle, we will probably want to ask if we can cut down the radiation of unwanted frequencies. The answer in most cases is yes.

### Antenna Coupler

Let's make up our mind that some sort of antenna-tuning device is always in order, not only to get the greatest efficiency from the radiator, but also to cut down spurious signals. Good designs are given in the *Handbook*,<sup>3</sup> and many excellent commercially-built units and kits are on the market. Where tuners provide for a grounding arrangement, this should always be the very best and most direct ground. One special precaution is in order, based on reports we have received. Don't overcouple the transmitter to the antenna or tuner! Beginners sometimes get the idea that the more turns there are in a link, the more r.f. will be coupled to the antenna. As a result, we have heard of links of ten and twenty and even thirty turns. Remember that such an arrangement is not only a link but a very effective capacitive-coupling device—something harmonics love like mice love cheese. Any two pieces of metal separated by an insulator form a capacitor of sorts, whether these be flat plates (as in an air variable) or rolled foil (as in a paper capacitor) or in coil form. Notice commercially-made coils for the 40- and 80-meter amateur bands. Usually these have only two turns, or three at the most.<sup>4</sup>

Measures which you have probably already taken in connection with TVI will also help with your low-frequency harmonics. For example: A Faraday shield in the final tank link, coax from this link to the shielded antenna tuner, and a shielded link in the tuner unit itself, grounding

of center taps of coils in balanced systems, and the like, are all beneficial. A low-pass filter will not have any effect whatever on low-frequency harmonics, since it is usually designed to pass everything below 30 Mc.

There are always a few special cases, and it may be that your rig seems to radiate unwanted signals despite everything that you have done to it. This is a good place for a huddle at the local club, as two heads are usually better than one at this point. If it is a manufactured item, write telling the maker exactly what happens, and follow his suggestions carefully. If your

# The Buffalo Area RACES Organization

*Getting Organized for Civil Defense Service in Erie County, N. Y.*

BY C. E. JOHNSON, JR.,\* W2PPY

• In past QSTs we have given you much information and advice on how to get set up for RACES. This article will tell you about Erie County's working organization, how it got that way and why.

ERIE COUNTY, New York, is the 13th largest county in the United States and has an area of 1042 square miles. There are three cities within its boundaries, namely, Buffalo, Lackawanna and Tonawanda with a total population of approximately 1,000,000 people.

The task of establishing suitable RACES networks within a county of this size was a formidable one. The local civil defense director required communications via amateur radio from one end of the county to the other. The terrain in the county ranges from flat to extremely hilly and the problems of reliable communications were many and varied.

Our first task was to decide how and on what frequencies the required networks would be established. A quick check of the RACES frequencies available to Erie County showed we had 10-, 6- and 2-meter frequencies available. After much discussion it was decided to build our networks around 6 and 2 meters, although there were many 10-meter mobile units available. Ten meters had been found undependable for short-range communications. In the civil defense test of 1953 this band opened up and stations from all parts of the county were calling our main control station causing confusion and chaos.

Erie County has two control centers, four zone headquarters, six aid check points and fifteen township report centers. The main control center

\* Radio Officer, Erie County Civil Defense, Room 218, City Hall, Buffalo, N. Y.

is located in the town hall in Lancaster, N. Y. This station, and its alternate, are able to operate on any RACES frequency assigned to Erie County by state civil defense. Three six-meter nets are controlled by 17-watt transmitters feeding ground-plane antennas: the Zone Headquarters Net on 53.6 Mc.; the Aid Check Point Net, 50.6 Mc.; and the Support Area Net on 53.74 Mc. This small amount of power seems ample for the distance to be covered. All other nets are controlled by 100-watt crystal-controlled transmitters feeding ground-plane antennas on 2 meters. One transmitter handles mobile control for the NE and SW Zone Headquarters on 145.200 and 145.320 Mc. respectively. A similar transmitter is used to control the mobile units for the NW and SE Zone Headquarters operating on 147.000 and 147.120 Mc. respectively.

The Township Net operates on a frequency of 145.440 Mc. and the State Command Net, which is the main link between the target city and the N. Y. State C.D. Headquarters in New York City operates on a frequency of 145.680 Mc. Any traffic for State is relayed via this net to a high-powered station called Area Ten Control Station, on 3509.5 or 3993 kc. located outside of the target area. There are two spare transmitters available at each Control Center.

The main target city, Buffalo, is divided into four zones. These zones are actually fully equipped control points with each service represented. Each of our zone Headquarters has a RACES installation capable of controlling any of nine mobile units assigned to it, or of contacting the Control Center should the need arise. The mobile control transmitter is 100 watts and the unit for contacting Control Center is 17 watts, both using ground-plane antennas. On 2 and 6 meters respectively the mobile units are small, compact

*(Continued on page 120)*

*(Left):* The EC and Radio Officer does his operating chore along with the rest of them. Here W2PPY operates one of the transmitters in the Erie County Control Center. *(Right):* The Zone Control Centers are busy places in any drill or test, as they will be if the real thing comes. This is Northeast Zone Control, with (l. to r.) operators Larry Thomas (non-amateur), K2GJP, K2HJB and K2GUC. Looking over their shoulders is K2DVD, Chief of Zone Communications.

## *The ARRL National Emergency Coördinator's Report of the League's Participation in FCDA's Yucca Flat Atomic Test Observer Program*

BY GEORGE HART, WINJMJ

"The shot is on!"

None of us really believed it. There had been too many such announcements during the previous nine days to have this one stir up any excitement. All it meant to most of us (that is, those of us who were still waiting) was another wearying bus ride to the AEC's Nevada Test Site, 90 miles away, probably to be followed by another last-minute postponement. By this time, we were hardened to such disappointment. Already we had journeyed to Yucca Flat three times, stood around in the freezing cold (and once in the freezing rain), went completely without sleep, except what we could snatch during the bus ride, only to be returned to Las Vegas without having seen anything except a lot of dry desert.

It was Wednesday evening, May 4th. To most of us observers, the weather looked favorable. There was very little breeze and visibility was good. A scattering of high cirrus clouds was expected to dissipate before morning. Once before, just a week ago, the weather had looked exactly like this, so we weren't too optimistic. Nevertheless, at 0400, the announcement was made that the shot was "on." Our long days of waiting seemed about to pay off. We kept our fingers crossed.

The time from then on flew rapidly. At 0430 daylight started to appear in the east, but it was still quite dark to the north, in the direction of the shot tower. At 0500, observers and media (press, radio, TV, etc.) personnel started shifting

around to find better vantage points to watch the shot. At 0510 minus thirty seconds we adjusted our high-intensity dark glasses (through which ordinary sunlight is scarcely visible) and listened to the countdown over the public-address system.

### *The "Shot"*

At exactly "zero" there came a blinding white flash (bright yellow through our glasses) and a sudden wave of heat. After three seconds we cautiously removed our glasses and watched the fireball form into its typical mushroom and fade through the color spectrum, from yellow to orange to red and finally to purple. Within fifteen seconds all that was left was a gigantic black mushroom with a whitening cap (ice crystals). This cap gradually detached itself from the rest of the mushroom and, rising gradually, it turned brown. Just beneath it a scraggly black cloud was forming, and at the base a cottony gray cloud of dust was spreading rapidly. The brown cloud, highly radioactive particles remaining from the shot tower, rose rapidly and approached the observer area. When it reached 40,000 feet, however, it was

• At the invitation of FCDA, the League sent its NEC to take part in Operation Cue. Some of his observations, including participation by amateurs, are presented herewith.

caught in a "shear" wind and dispersed. At the end of an hour, it was no longer visible. The black cloud, also radioactive but less so, rose more slowly and was eventually also dispersed. The gray cloud of dust spread laterally until it covered an area many miles in diameter, eventually permeating our observer area; the radioactivity in this dust cloud was said to be negligible.

The shock wave, arriving completely unannounced about forty seconds after zero, took most of us by surprise. It was a very sharp and sudden "blam!" rather than the deep rumbling we had expected. At our distance it was not strong enough to knock anybody over, but it startled many observers and stirred up a considerable amount of dust.

#### *Mass Feeding*

Now the mass feeding teams, which had been feeding us coffee and doughnuts all night, swung into action to feed us breakfast. These people, coming from all over the United States, were part of the Civil Defense Field Exercise group which was stationed at Mercury, Nevada. They also fed us a good substantial lunch on the following day on shot-plus-one tour of the forward area.

#### *Hams in Forward Area*

The group of volunteers who were stationed in the forward area 10,500 feet from ground zero joined us for breakfast. There were two amateurs among them (out of sixteen people) — W2TH, from Newark, N. Y., and W6LYF, from San Diego, Calif. They both appeared somewhat shaken up, but otherwise little the worse for their experience. Howard, W2TH, was left without appetite for breakfast, so we dined on one of the observer benches with W6LYF and had a very pleasant chat. Since then, we have asked both of them for a brief paragraph describing their experiences in the forward trench. Each supplied us with more than that, so we had to condense them to the following:

**W2TH:** "The most blinding light I ever saw, equal to 100 suns, was projected into the bottom of the trench. . . . I became conscious of the trench shaking from side to side. . . . Dirt fell in from the sides. . . . A terrific BANG split the air, seeming to come from everywhere overhead. . . . All sorts of debris was flying over our trench. . . . Then the command 'Out of the trench!' . . . Two of the Jeeps had their lights turned on

Part of the California Communications Caravan. Eight amateurs were in the crew of 25 who manned these units. The buses, completely equipped with spotlights, floodlights, p.a. system and multitudinous transmitting equipment (note the whips), were used for control purposes. Radio cars were assigned to c.d. service chiefs. All these units operated with the C.D. Field Exercises and were stationed at Mercury, Nevada.

by the blast. . . . As the base of the atomic cloud approached menacingly, we loaded into our Jeeps and got out of there." W2TH is RACES Radio Officer for Wayne County, N. Y. He carried a Gonset transmitter into the trench with him.

**W6LYF:** "'Shot' time found us kneeling in trench with fiber glass helmets, goggles and respirators in place, hands covering our eyes and hold-

W2TH and W6LYF, very much as they looked after emerging from the trench at 10,500 ft. from the shot tower. They were among 16 volunteers at that point.

ing our breath. Could see the light from shot through covering. Earth started to rumble (like an earthquake) and then came shock wave. Rocks and dirt fell into trench, then came the noise of the blast, loud and sharp. At shot plus fifteen seconds, we were standing in trench looking at the enormous cloud, brown with pink tints, rising before us. At shot plus five minutes we were in Jeeps headed for Media Hill six miles away and breakfast." W6LYF is Radio Chief for California Region 10 (San Diego and Imperial Counties). At Operation Cue, he was a member of the California communications team which provided communications for FCDA-sponsored field exercises before and after the shot.

### Post-Shot Briefings

The day following the shot we made our last (sixth) trip to Yucca Flat, for most of us completing a total of over 1000 miles of travel in the buses provided. The purpose of this trip was to observe the destruction of "Doom Town" by the atomic blast. From a communications standpoint, let it be said that radio equipment stands up well under an atomic blast, provided it is not much closer than a mile from ground zero. Even then, if properly protected by shelters, it has a good chance of remaining in operating condition. A 250-watt broadcast transmitter installed in one of the steel-reinforced concrete block houses at the 4700-foot line was in actual operation on the Conelrad frequency of 1240 kc., using the call KO2XBM. This rig, sponsored by RETMA, was in operation until five minutes before the blast. After the blast it did not return to the air immediately, but the trouble was found to have been power failure; the equipment remained in operating condition and returned to the air shortly after the blast.

Other radio communications equipment in this and similar houses was found to be undamaged and still in working condition. Of the two towers closest to the blast, the guyed standard broadcast tower remained standing, although very slightly bowed. The unguyed 120-ft. tower had been broken off in the middle.

"Doom Town" had become "Survival City," but not everybody survived. "People" (mannequins, of course) in the open didn't have a chance, what with the combined effects of heat, radiation and blast, each lethal by itself. Those in the above-ground parts of the various houses were killed either by blast or missiles. Only those in basement shelters survived, although many were injured. Naturally, the closer to ground zero the greater the destruction. Normally-constructed houses 4700 ft. from ground zero were reduced to rubble, but the specially built concrete-and-steel block houses stood up well.

### Amateurs in Field Exercises

There were a few amateurs in the observer and media groups, but most of them were amateurs incidental to some other capacity. The real communicating was done by the Field Exercise group stationed at Mercury, just a few miles from the shot area. This included amateurs belonging to the California communications team, which came

in convoy from Sacramento starting on April 17th, traveling via Los Angeles and picking up members along the way. Personnel in the convoy numbered about 25, including the following amateurs: W6s JN ASI RLB CIS LY CV OU and WYT. Equipment consisted of two completely-equipped communications buses and several cars (see cut) operating in the Disaster Communications Service (1761.5 kc.) and 47 Mc. During the period of the actual exercise, no amateur frequencies were used. One bus was stationed at the Observer Area on Media Hill, the other at field crew headquarters located approximately a mile forward.

The communications gang worked hard. The Field Exercises were no picnic. Troubles developed with the equipment (as they always do) necessitating long hours of trouble shooting. Some special communications arrangements had also to be set up, necessitating some equipment changes. Most of this work was done out in the open which, in the desert at that time of year, means a scorching sun and swirling dust during the day, penetrating cold dropping far below freezing at night.

W6CIS (ex ARRL Director, Pacific Division) received special permission from the AEC to use his call from one of the buses to keep in contact with home offices in California. He fired up one of the rigs using 813s running 250 watts to an 18-foot base-loaded whip mounted atop the bus. Power was supplied by a 3.5-kw. generator which is standard equipment on the buses. Much traffic was handled, with the assistance of many California amateurs, on the California Civil Defense Net frequency of 3501 kc. and other frequencies. This circuit came in mighty handy for getting word back home in lieu of the greatly-overtaxed telephone facilities through Las Vegas. In addition to personal traffic, much civil defense official traffic was also handled. W6CIS lists and wishes to thank the following stations for having assisted in keeping this traffic moving: W6s SWP BP SDR CLV EAR HOR ATO JGJ CJP IZG KB WR JDG CGQ JKW PQW IRJ KMJ, K6s JOQ DM HYT CB and K7FNS. W6JN did much of the operating from W6CIS/7.

\* \* \*

We wish it were possible here to impart more fully to all readers the information picked up

(Continued on page 122)

A snapshot of the "shot" tower (background) from 4700 ft. away. Other installations in view are test installations. The 500-ft. tower was unguyed, 20' square at the base, equipped with elevator, cost about \$250,000. Nothing, but nothing, was left of it after the blast.

August 1955

# QST—Volume IV

## Part II† — 1954 Supplement to the Foreword to the Index to Volume IV of QST

ONE of the puzzles which I have been unable to solve, from the data appearing in Volumes III, IV, and V of *QST*, is this: how many "tube" transmitters were actually in operation at amateur stations in the U. S. A. as of approximately July 1, 1921?

It finally occurred to me that it might be interesting to examine the published lists of "Calls Heard," from January, 1920 (when the first express reference to a "tube" set appeared in that department of the magazine), up to and including August, 1921, when the lists of stations heard during June, 1921, were published. Accordingly, I have done this; and I have separated from those lists the stations which various reporters identified as using c.w., i.e.w., buzzer-modulated telegraphy, and 'phone. To give the reader some sort of an idea of when each "tube" station first got into operation, I have also listed the issue and page of *QST* where its call was first published in "Calls Heard"; and I have identified the reporting station.<sup>1</sup>

No attempt was made to follow possible changes from i.e.w. to c.w., or from c.w. to 'phone. I have simply listed the description of the type (or types) of transmission, as first reported in *QST*.

*Unlike low-powered spark transmitters, v.t. rigs were potent distance-getters. Therefore, I believe that almost all of them were rather promptly reported in "Calls Heard."* A possible exception would be the low-powered 'phone stations which would have little range; but I doubt if many such stations were in existence during the period studied.

The geographical distribution of these "tube" sets, as between the nine districts, is indicated by the list — to some extent, at least.

The totals are as follows:

Unlicensed.....	2
First District.....	93
Second District.....	158
Third District.....	45
Fourth District.....	11
Fifth District.....	9
Sixth District.....	28
Seventh District.....	7
Eighth District.....	126
Ninth District.....	52
Total.....	531

In addition, 5 Canadian v.t. stations were listed in "Calls Heard"; and 23 short-wave Army, Navy, commercial, or government v.t. stations appeared there.

As will be seen by the second table, following the compilation of data from "Calls Heard," there were some *additional* v.t. stations *not* appearing in the published lists of "Calls Heard" which were referred to in the pages of *QST*, between January, 1920, and August, 1921. (January, 1920, is in Volume III; August, 1921, is in Volume V.) The "score" on these is as follows:

Unlicensed.....	1
First District.....	12
Second District.....	4
Third District.....	7
Fourth District.....	1
Fifth District.....	3
Sixth District.....	1
Seventh District.....	3
Eighth District.....	6
Ninth District.....	8
Total additional stations.....	46
(Including 2 not referred to by Call-Letters)	

In Canada, 3 additional v.t. stations are shown (including one which is referred to by the name of its owner and not by call letters).

These two lists (and the appended tables, which give details) demonstrate that at least 577 amateur v.t. transmitters had "come onto the air" in the U. S. A. by July 1, 1921. The question remains: how many *more* amateur v.t. installations were in the United States as of that same date?

I can only make a *guess* on this; and my best guess is: not over another 400 — making a total for the United States, as of July 1, 1921, of 977 amateur v.t. stations.

As of June 30, 1921, the total number of *all* amateur stations licensed by the Department of Commerce had reached 10,809. See page 68 of *Two Hundred Meters and Down*, by the late Clinton B. De Soto, where it is said:

... The Department of Commerce reported 10,809 licensed amateur stations at the end of the fiscal year on June 30, 1921, an increase of 90 per cent. ...

If my guesses as to the numbers of licensed stations using "tube" transmitters, as of the two dates (July 1, 1920,<sup>2</sup> and July 1, 1921), are compared, it will be seen that the indicated increase, in the number of v.t. sets, 777 additional v.t. sets, is 388.5%.

I think that's "about right."

† For previous installments see following *QST* references; Part I of "*QST* — Volume IV," July, 1955; "*QST* — Volume I," October, 1954; "*QST* — Volume II," February, 1955; Part I of "*QST* — Volume III," March, 1955; Part II of "*QST* — Volume III," April, 1955; Part III of "*QST* — Volume III," June, 1955.

<sup>1</sup> For absolute accuracy, it probably would be necessary

to check and re-check each list of "Calls Heard," and to transfer the items of information to punched cards; and to run the latter through an IBM tabulator. This I have not done; but I have tried very hard to avoid errors.

<sup>2</sup> It was "not over 200 stations," as of July 1, 1920. See "Foreword to the Index to Volume III," *QST* for March, 1955, page 51.

On the same premise, one amateur station in 28.59 had a "tube" transmitter as of July 1, 1920; and one amateur station in 11.06 had one, as of July 1, 1921.

Again, I think those figures are "about right."

Remember, please, that on the above subject I cannot offer proof. All I can do is to hazard an intelligent guess based on my recollection of actual operating conditions and on the data above set forth.

On another subject mentioned in my "Foreword to the Index to Volume IV of *QST*," I would also like to add a few words:

As to the short waves (meaning those below 200 meters) there is some later evidence showing that amateurs, in general, lacked proper receiving apparatus for picking them up; and which shows that this condition of affairs lasted for a considerable period of time. For instance:

In the May (1924) issue of *QST* (Volume VII), at page 10, Dr. A. Hoyt Taylor, Physicist, U.S.N., in his article called "The Navy's Work on Short Waves," stated as follows:

... Our interest in short waves is by no means a new one. Since 1917 one of the standard waves on board every battleship has been 150 meters. From a modern point of view the apparatus is pretty crude, being a peculiar type of spark set which is now of no particular interest; nevertheless occasionally extraordinary long distances were reached with it.

*Had amateurs in the last few years had receivers capable of tuning down below 200 meters, we would doubtless have had a great many reports on our transmissions on 150 meters by these ships. Plans are now under way to replace this old equipment with modern tube sets of our own design.* . . . [Italics added by S.B.Y.]

In Volume VI of *QST* I have also run across some additional material on early amateur work with small "tube" transmitters which was done for the purpose of QRM avoidance; and I would like to refer to it now:

At 12, March 1923, S. Kruse (Technical Editor of *QST*), in an article entitled "Exploring 100 Meters," described some preliminary experiments on waves about 170 meters long, as follows:

"... In the winter of 1920-21, mainly to get away from NSF's chopper and NAA's arc mush, we at Washington, D. C., began to feel our way downward. To our pleased surprise we found that our regular sets would work easily below 170 meters if anyone could be induced to get down and listen for them. A low-powered tube set in Washington and a

small spark-tube set in Hyattsville, Md., were able to work beautifully without any interference at all from NSF, NAA or *anything* else on *any* wavelength, although 3RP at Hyattsville was using only a Western Electric 'E' tube driven by a Ford spark coil. His signals at Washington (8 miles) were so intense that the phones were normally left on the table. The other station, 3ABI, was able to work ITS and IQP whenever they could be induced to tune down — again there was *no interference*. . . .

To those readers who are interested to know what type of amateur short-wave work next followed the first "dips" below 200 meters (which were motivated by a desire to avoid interference), I strongly recommend close study of the balance of this same article by Mr. Kruse. It recites: the January (1922) tests of Mr. Boyd Phelps, at Minneapolis, Minnesota, on 100 meters; Phelps's later tests, in the spring of 1922 (after he had moved to Hartford, Connecticut, and had joined *QST*'s staff); the January (1923) tests between 9ZN and 1HX, 3XM, IQP, 3ALN, 3JJ, 3APV, and the listening-station of Mr. A. L. Budlong (at Washington, D. C.); and also the February, 1923, tests between 3ALN, IQP, and 9ZN.

Out of these experiments<sup>3</sup> an interesting fact emerged. On page 12, of the March, 1923, *QST*, Mr. Kruse stated it in these words:

... Why all these logs? For this reason — *in every single test, with one solitary exception, the best signals were heard at some wave length below 170 meters.* Even if we forget all about the decreased interference it is possible for us to move downward, work our antennas near their fundamentals (or below) and get better signals thru.

The early settlers have found the region of 100 meters good; they invite the amateur world as a whole to come along. . . .

As a first step toward stimulating general amateur interest in the wavelengths around 100 meters, the League's Traffic Manager, F. H. Schnell, announced "A 100-Meter CQ-Party," for the nights of March 24th and 25th, 1923. (See Volume VI, at 12 to 13, March 1923.) In addition, the following announcement was made by that official (see 13, March 1923, in Volume VI):

"... We are planning a system of short-wave test stations which will, at the same day and hour of each week, start at 200 meters and send tests down to 100 meters or lower. The schedule is not ready but will be broadcast on 200 meters on March 3rd and 10th by picked ARRL stations in each district,

(Continued on page 124)

<sup>3</sup> Mr. K. B. Warner interjected a somewhat critical note, re some of the experiments conducted by amateurs on waves between 80 and 135 meters, during the winter of 1922-1923. On this see his editorial, "A New Field," at 29 to 30, March 1923 (Volume VI). Here he said:

... Last winter considerable work on waves between 80 and 135 meters was done between some amateur stations in Boston, Hartford, and Pittsburgh, but the data seems to have become commercially interesting and the fellows in possession of it have shut up like clams and there is slight hope that those particular results will ever become available to us. As a result some of our own gang have determined to dig up the dope for themselves and the preliminary tests have been most encouraging. . . . [Italics added by S.B.Y.]

In the next paragraph of the same Editorial, Mr. Warner pointed out the freedom from interference which users of 100-meter waves were enjoying, and then referred to the added "bonus" of appreciable increase in radiation efficiency which had been experienced when the wavelength was shortened:

... Do you know that 100-meter transmission between Illinois and Connecticut is proving F.B.? It is! At the present time there is of course practically no QRM on such wave lengths except an occasional harmonic. That alone makes it worth while. There seems to be an appreciable increase in the efficiency of radiation as the wave length is dropped; and there is the 'kick' the experimenter gets in trying something new — and succeeding. . . . [Italics added by S.B.Y.]

# Happenings of the Month

## ELECTION NOTICE

**To All Full Members of the American Radio Relay League Residing in the Atlantic, Canadian, Dakota, Delta, Great Lakes, Midwest, Pacific and Southeastern Divisions.**

An election is about to be held in each of the above-mentioned divisions to choose both a director and a vice-director for the 1956-1957 term. These elections constitute an important part of the machinery of self-government of ARRL. They provide the constitutional opportunity for members to put the direction of their association in the hands of representatives of their own choosing. The election procedures are specified in the By-Laws. A copy of the Articles of Association and By-Laws will be mailed to any member upon request.

Nomination is by petition, which must reach the Headquarters by noon of September 20th. Nominating petitions are hereby solicited. Ten or more Full Members of the League residing in any one of the above-named divisions may join in nominating any eligible Full Member residing in that division as a candidate for director therefrom, or as a candidate for vice-director therefrom. No person may simultaneously be a candidate for both offices; if petitions are received naming the same candidate for both offices, his nomination will be deemed for director only and his nomination for vice-director will be void. Inasmuch as all the powers of the director are transferred to the vice-director in the event of the director's resignation or death or inability to

perform his duties, it is of as great importance to name a candidate for vice-director as it is for director. The following form for nomination is suggested:

### *Executive Committee*

*The American Radio Relay League  
West Hartford 7, Conn.*

*We, the undersigned Full Members of the ARRL residing in the ..... Division, hereby nominate ..... of ..... as a candidate for director; and we also nominate ..... of ..... as a candidate for vice-director; from this division for the 1956-1957 term.*

*(Signatures and addresses)*

The signers must be Full Members in good standing. The nominee must be a Full Member and the holder of an amateur license, and must have been a member of the League for a continuous term of at least four years at the time of his election. No person is eligible who is commercially engaged in the manufacture, sale or rental of radio apparatus capable of being used in radio communications, or is commercially engaged in the publication of radio literature intended in whole or in part for consumption by radio amateurs.

All such petitions must be filed at the headquarters office of the League in West Hartford, Conn., by noon EDST of the 20th day of September, 1955. There is no limit to the number of petitions that may be filed on behalf of a given candidate but no member shall append his signature to more than one petition for the office of director and one petition for the office of vice-director. To be valid, a petition must have the signature of at least ten Full Members in good standing; that is to say, ten or more Full Members must join in executing a single document; a candidate is not nominated by one petition bearing six valid signatures and another bearing four. Petitioners are urged to have an ample number of signatures, since nominators are occasionally found not to be Full Members in good standing. It is not necessary that a petition name candidates both for director

*(Continued on page 130)*

Gov. William G. Stratton is shown signing into law the bill authorizing issuance of special call-letter license plates to amateurs in Illinois. Witnessing the happy moment are Hon. Paul Zemple, House of Representatives; Rev. Anthony T. Tamulis, W9PQS; William P. Ingersoll, W9BHT; Ladd J. Smach, W9CYD; Tom G. Seese, W9LZ; Alex K. Scherer, W9EU; and Hon. Albert Scott, State Senator.

Gov. George W. Leader wields the pen in Pennsylvania. Participating in the ceremonies were Gilbert L. Crossley, W3YA, Atlantic Division Director; Rep. Albert S. Readinger; James F. Cochran, W3MLY; William T. Burton, Jr., W3ADF; Rep. Charles C. Smith; and James F. Marx, W3BN. W3RSB served as chairman of the committee but was in the hospital when the bill was signed.

## KA STATIONS

APO 343  
San Francisco, Calif.

Editor, *QST*:

It has recently occurred to me that much misinformation exists regarding operation of amateur radio stations in the Far East. I am therefore taking the liberty of writing this letter in an effort to outline the operation of amateur radio stations by members of the United States Forces stationed in the Far East Command.

As you undoubtedly know, immediately subsequent to cessation of hostilities in this theater, operation of amateur radio stations in Japan and other portions of the theater was authorized by the Supreme Commander. These stations operated with the call sign prefix normally used by citizens of Japan (JA). When sovereign rights were restored to the Government of Japan, however, it was necessary that definite agreements between the United States and Japan be executed. The specific agreement which permits operation in the amateur bands in Japan is outlined in the Telecommunications-Electronics Agreement supplementing the Administrative Agreement under Article III of the Security Treaty between the United States and Japan.

It was agreed that the terms "amateur," "license," and "licensee" would not be used in describing privately owned stations operating in the amateur bands in Japan. These stations were known, instead, as Auxiliary Military Radio Stations (AMRS), and such stations were to operate with the call sign prefix "KA" rather than the "JA" previously authorized.

Operation of the amateur radio stations was to be regulated by such regulations and directives issued by the Commander in Chief, Far East, or his successor, as were required for orderly operation. One of the stipulations in this agreement was that Far East Command regulations would be in consonance with the Japanese rules and regulations governing their own amateur service. Specifically, the difference between the Japanese laws and those laws which govern operation of amateur radio stations in the United States were not very great. Up until recently, amateur radio stations operating in Japan operated under rules and regulations very similar to those of the Federal Communications Commission. Approximately eleven months ago, however, the Japanese Government pointed out that Japanese National amateurs are prohibited from handling third-party traffic; and since the United States had agreed to issue such rules and regulations as would be in consonance with the Japanese laws, the Japanese Government requested the Commander in Chief, Far East, to issue the necessary directive prohibiting the handling of third-party traffic by United States Forces personnel operating in Japan. Also, since Japanese law states that only the licensed operator of a station may operate the station, the United States was requested to prohibit the privilege of a non-licensed individual speaking over the microphone of an AMRS station.

Discussion and study of this proposal took some eleven months to complete. It was finally agreed, however, that the Japanese request was valid, inasmuch as the agreement specified above clearly stipulated that operation of United States Forces AMRS stations would be in consonance with operation of Japanese National amateur stations. It was therefore agreed that the United States would issue such directives as would be required to prohibit the handling of third party traffic by AMRS stations located in Japan. Since the agreement specified above did not include any territory outside of the Japan limits, operation of amateur stations in Okinawa was unaffected.

I have no doubt that some word of the third-party traffic prohibition has reached you, and I expect that some of the information you may have received has been garbled. I hope that I have been able to outline the present conditions under

which members of the United States Army Forces are able to enjoy their amateur privileges in this country, and hope that you may be able to afford some publicity to the capabilities and limitations of amateur operation in the Far East by such notices in *QST* as you deem appropriate. If I may be of any further assistance in providing you with other details, please advise me as soon as possible, and I will sincerely attempt to do so.

— Major August J. Sabel  
Director of AMRS

## MORE ON RAPP

8314 So. Langley Ave.  
Chicago 19, Ill.

Editor, *QST*:

Thanks to W6TKA (June *QST*). He has presented a viewpoint concerning the Larson E. Rapp, W10U, articles in which I concur. Be assured this is also the opinion of more of your readers than you may suspect.

Down with Rapp — there's already enough "April Fool" in the stuff I build!

— James A. Gundry, W9KNP

1311 N. Ode St.  
Arlington, Va.

Editor, *QST*:

All this fuss over the article in the April, 1955, issue of *QST* has me worried. If this man's article is not true, does this mean that his other articles were not true, also?

I'm only a beginner at radio now (6 months), and about 3 months ago I was given past issues of *QST*. Naturally I read them by the hours, trying to learn as much as I could. But it just occurred to me that the article "The Double-Spectrum Theorem" (*QST*, April, 1952) probably is not true. If it was, why aren't we using it? An article appears in every April issue of *QST*. Why print it? You just waste space and confuse people.

— Charles Long, K4BND

3127 N. 17 Drive  
Phoenix, Ariz.

Editor, *QST*:

The letters in June *QST* about your Rapp articles are enough to make one bury his head in his hands and cry like a baby. The human race *must* be more highly advanced than these indicate. Here's a vote for maintaining your work as before. Those articles were obviously hoaxes to me at the age of 14.

— Charles Fenwick, W7YMO

## NEW SYMBOLS

1208 Jarvis Ave.  
Chicago 26, Ill.

Editor, *QST*:

In case you are collecting opinions, I should like to add my vote of dissent to the new system of schematics. They impress me as being full of "hay" and hard to read, particularly the power socket and coaxial-cable designations.

— E. W. Williamson, W9ROE

Qtrs. I, Charleston Naval Shipyard  
Charleston, S. C.

Editor, *QST*:

Here is my complaint to add to the many thousands I'm sure you have already received.

I do not (repeat, NOT) like the new wiring diagrams. After forty years' experience with the others, I'm sure I never will like 'em.

— G. L. Countryman, W3HH/4  
Captain, USN

BY ELEANOR WILSON,\* W1QON

## New Term for the YLRL

The new officers of the Young Ladies Radio League assumed their duties July 1st and will serve an 18-month term in order to put the club on a calendar year starting January 1, 1957.

President of the YLRL for 1955 and '56 is Alice "Cris" Bowlin, W9LOY, of Chicago, Ill.; YLRL chairman for the ninth district last year. Cris is one of the founders and a past-president of the LARK of Chicago. With her OM, W9RQF, she operates on 40 and 75 'phone.

Last year's publicity chairman became the V.P. for the new term. Also a past-president of the LARK, Gloria Matuska, W9YBC, of North Riverside, Ill., served with W6LBO as co-chairman of publicity for the First YLRL International Convention. The XYL of W9ATW, she is on 20 and 40 c.w. and 'phone. See her photo in the YL department of *QST* for Sept., 1954.

Marie Ellis, W0MMT, the new YLRL Secy.-Treas., is SEC for Colorado and assistant to ARRL Director W0IC, representing YLs in the Rocky Mountain Division. On 75 meters primarily, Marie is also Secy.-Treas. of the Trout Route Mike & Key Club of Ft. Collins.

Peg Ferber, W3RXV, of Slatington, Penna., continues for a second term as editor of *YL Harmonics*. Realizing her aims of a year ago, she

\*YL Editor, *QST*. Please send all contributions to W1QON's home address: 318 Fisher St., Walpole, Mass.

The forty YLs who attended the 5th annual LARK Convention in Chicago May 20th thru 22nd voted to change the name of their annual meeting hereafter to Midwest YL Convention. Chairman Helen Boddy, W9BCA, announced that next year the affair will be held at St. Paul, Minnesota.

has effected a number of changes in the club paper. She works several bands with a Viking and is the XYL of W3RXW. See her photo in the YL department of *QST* for Sept., 1954.

The March, 1955, YL department carried a story and photograph of the new publicity chairman, Barbara Harrington, W1TRE, of Topsfield, Mass.

Because of a tie vote, ballots will be cast again for a chairman of the first district.

The other district chairmen follow:

**K2IWO** — Hilda Andrew; Newburgh, N. Y.; ex-W4HWR and D4AAB; licensed since 1941; XYL of W4EFG, Air Force chaplain.

**W3TSC** — Camille Hedges; Washington, D. C.; operates 40 c.w. daily; OM is W3BKE.

**W4BLR** — Katherine Anderson; Richmond, Va.; licensed less than two years ago, Kay already has several merit awards and contest certificates to her credit. Her photo appeared in "Results of the Novice Round-up — 1954," *QST* for June, 1954.

**W5SYL** — Iva Haley; Grand Prairie, Texas. XYL of W5MTQ; NCS of the K.L.R. Net for the past two years.

**W6FEA** — Gertrude Cassidy; Fresno; about to move to San Francisco; served as YLRL sixth district chairman in 1951 and '52; is V.P. of American Legion Amateur Radio Net; OM is W6WJF.

**W7** — The chairman for the seventh district will be appointed by the president.

**W8LGY** — Ruth Rickett; Columbus, Ohio; on 3960 kc. daily; OM W8BTW.

**W9AQB** — Norma Courtney; Mishawaka, Ind.; had top score for her district in the last YLRL Anniversary Party; OM is W9AQA.

**W0KJZ** — Lydia Johnson; St. Paul, Minn.; operates "99 per cent c.w."; has Code Proficiency Certificate for 25 w.p.m.; busy on several traffic nets.

**VE** — The chairman for the VE districts will be appointed by the president.

**KZ5LM** — Lois Magner; Margarita, C. Z.

**KH6AFC** — Hazel Keefer; Honolulu.

As stated in the club constitution, the Young Ladies Radio League is an organization consisting solely of duly licensed women amateur radio operators. The aim of the YLRL is to further coöperation among members, to develop efficiency in radio operating, and to further the

W8LCY

W9LOY

W9AQB

interests of amateur radio in general. Organized in 1939 by Ethel Smith, W3MSU (then W7FWB), the current membership is close to six hundred. Any licensed woman amateur may join.

During the past term the club constitution and by-laws were revised for the second time (first revision in 1948). A second edition of the *YLRL Directory* was edited by Lenore Conn, W6NAZ, and the first YLRL International Convention was sponsored by the Los Angeles Young Ladies Radio Club.

The YLRL conducts two major contests annually — the YLRL Anniversary Party and the YL-OM Contest. It also conducts weekly nets on several bands. The net schedule for the new term will be published in this department.

*YL Harmonics*, a publication issued bi-monthly by the organization, gives the membership coverage of club activities and news.

There are three YLRL awards available to any licensed amateur — Worked All States-YL, YL Century Certificate, and Worked All Continents-YL.

### YLS You May Have Worked

**W1VXC** — One of but a very few YLs in R. I., June Burkett of Rumford is PAM for her state. Traffic handling is June's favorite kind of operating. Her OM is W1OGT.

**VE3DDA** — From Brantford, Ont., Eleanor Elliot puts

out a good signal on 80 meters in spite of running only 12 watts to a home-brew rig. The OM is VE3BZP.

**KN0AYQ** — Only 8 years old, Bonnie Pass of Ladue, Mo., is giving her twin 14-year-old brothers, W0s MSA and MSB, competition on 40 c.w.

**W9IMT** — Elzenia "Red" Stalcup of Bloomfield, Ind.; XYL of W9HSK. She operates on 75, 40 and 20. Red also holds a code proficiency certificate for 25 w.p.m.

**W9RUJ** — For 18 years Mary Meyer of Waukesha, Wisc., listened to the amateur frequencies before getting her own license in 1952. She uses a B&W 5100 on several bands.

**W1WJA** and **W1VVS** — Marjorie Bayer and Shirley Ailes are sisters living fifty miles apart in Vt. They deemed it less expensive to buy radio gear than to pay telephone bills. They are both readily available for Vt. contacts on 75.

**W6QMO** — Jeri Bey is president of the San Francisco YLRL unit. An OPS and BPL certificate holder, Jeri participates in a number of traffic nets.

**W0MPB** — Dot Breeden of Topeka, Kan., made some 1500 contacts in just a few months after obtaining her license in July, 1954. The XYL of W0LHX, she uses a home-built rig on several bands, 'phone and c.w.

**VE2NJ** — Nancy Jeary has been active since 1947. From her Greenfield Park, Que., QTH she can be found on 3785 kc. "at breakfast, lunch, and dinner time daily." Her OM is VE2OS.

### WAS-YL Award

1) The Worked All States-YL award is available to all amateurs.

2) Two-way communications must be established on the amateur bands with all 48 states. Any and all amateur bands

# Hints and Kinks

## For the Experimenter

### PROTECTION FOR VOLT-OHM-MILLIAMMETERS

MANY of us who make frequent use of a general-purpose test meter will, at one time or another, inadvertently apply voltage to the terminals of an instrument having the function or selector switch set at the *ohms* position. This act of negligence may result in a burnt-out multiplier shunt, a new configuration for the pointer or even more serious damage to the meter movement.

The installation of a fuse as a preventive measure against this mistreatment of a meter is not always desirable or completely effective. The resistance of low-current fuses may not be too uniform and, in some cases, the resistance—whatever it happens to be—is great enough to affect the calibration of the *ohms* ranges of the instrument.

A more positive protection for a meter may be obtained by connecting a No. 14 flashlight lamp in series with the internal shunts. It has been determined that the resistance of these 2.5-volt 0.3-amp. bulbs checks consistently at very close to one ohm. Therefore, once the meter circuit has been modified to include a bulb, it is possible to make replacements in event of failure without concern over variations in calibration.

Fig. 1 shows how a No. 14 bulb has been connected into a typical general-purpose test meter.

Fig. 1—Protective arrangement for volt-ohm-milliammeters suggested by W9AFT.

The circuit and constants shown are for the popular Simpson type 260 meter. The 1-ohm resistance of the bulb is compensated for by removing approximately 2 inches of resistance wire from the 11.5-ohm shunt ( $R_{16}$  of the Simpson circuit). Usually, it is possible to find mounting space within the meter case for a socket for the bulb. This method of installation simplifies the changing of a burnt-out lamp.

Any voltage applied to the *ohms* terminals that is lower than the *burn-out* rating of the bulb will not cause damage to the meter shunts. At higher values of voltage, the bulb will burn

out even before the pointer can deflect to full scale. It should be pointed out that *all* resistance ranges of a circuit of the type shown are protected by this simple installation.

—Harlon Wright, W9AFT

### IMPROVED BLEEDER CIRCUIT

THE arrangement shown in Fig. 2 provides a warning *before* the bleeder resistance burns out, and also a voltmeter for the output of a power supply.

The normal bleeder resistance is made up of two branches in parallel, each branch having

Fig. 2—Schematic of the improved bleeder circuit.

twice the resistance of the normal bleeder. A milliammeter connected in the common negative leads reads the normal bleeder current. If one branch of the bleeder opens up, the other branch will still discharge the filter condensers, but the meter reading will fall to half its original value, warning the operator that one branch has burned out and should be replaced as soon as possible.

If the branches are made of equal resistance, each branch of the bleeder can have half the power rating of the normal bleeder. If, for example, the normal bleeder resistance is 25,000 ohms, 50 watts, each branch can be 50,000 ohms, 25 watts.

The output voltage of the supply can, of course, be determined easily by multiplying the current indicated by the milliammeter and the bleeder resistance in series with it. When the branches are equal, this resistance will be half the resistance of either branch.

Any milliammeter will read directly in voltage if the bleeder resistance is 10,000 ohms, or 100,000 ohms, the voltage being 10 or 100 times, respectively, the reading in milliamperes. A 25-ma. meter, for instance, will read 250 volts full scale with a 10,000-ohm bleeder, or 2500 volts with a 100,000-ohm bleeder.

—Rev. Joseph A. Terstegge, W9LQE

[Caution: The bleeder circuit becomes inoperative if the meter opens up! —Ed.]

CONDUCTED BY EDWARD P. TILTON, WHDQ

**T**HERE are some 300 logs from the June V.H.F. Party already in the Communications Department files as we write, and with the reporting deadline still several days away more are arriving in every mail. A nationwide picture cannot be drawn at this time, so we will not attempt it until next month, but one thing is certain: the 6-meter band has staged a remarkable comeback. For the first time in several years, the downward trend of 6-meter participation in our contests has been reversed — and decisively.

Scattered through the correspondence accompanying the logs are frequent comments like "Sure glad to see the activity picking up on 6 again!" "Reminds me of '46, '47 and '48!" "Made 91 contacts on 6 this time, compared to an average of 40 in previous contests."

Obviously, the opening of the 50-Mc. band to Technician licensees couldn't have come at a more opportune time. The April 12th deadline gave the newcomers a running start on the 1955 sporadic-E DX season and, perhaps even more important, the knowledge that there would be some new calls on the band to work flushed out no small number of the old timers who used to be on 6, but have not bothered to get on recently.

Many fellows write that, for the first time in several years, they can now find something doing on 6 any evening, and occasionally during the daytime hours, too. It's certainly true in New England; we're not overwhelmed with QRM, by any means, but you can make casual contacts once again. When the band is open, states are heard that have been missing for the past two or three seasons. No longer is operation confined to the one "net night" each week.

This is all to the good, for 6 is too fine a territory to lie unused, DX season or any other time. Simple converters,

moderately-sized antenna systems, and transmitters that won't ruin the family budget provide consistent coverage that could easily take over much of the burden now carried by lower bands. Thousands of hams now knocking each other out (or trying to) in the turmoil between 3800 and 4000 kc. could work over much of the same territory on 50 Mc. with a fraction of the power — and no strife.

The 6-meter band is 20 times as wide as the 75-meter 'phone band, and as good or better, for distances up to at least 100 miles. On 6 you can use any mode of operation you like — c.w. a.m., f.m., teletype, s.s.b., duplex — with little or no worry about stepping on anyone else's toes. The static level is low most of the summer, and an ionospheric disturbance means DX, not a washed-out band.

◆

The biggest 2-meter antenna? W7LHL, Seattle, Washington, has 96 elements. Each bay of this gigantic structure has two half waves in phase, with reflectors and directors. With a high-powered c.w. rig and a low-noise converter, W7LHL is loaded for bear.

The TVI threat, once considered an insurmountable obstacle in Channel 2 areas, is being licked. There are many ways to do it. W2IDZ showed some of them in June and July, 1954, *QST*, and the considerable nightly 6-meter activity now observed in Northern New Jersey is evidence that he knew what he was talking about. As far as the other channels are concerned, eliminating TVI with a 6-meter rig is no more of a problem than it is on any other ham band; in most cases it's easier on 6. A 50-Mc. "TVI Special" is undergoing final tests in the ARRL Lab, as we write. It will deliver a clean and husky 40 watts, and you'll not find it difficult or expensive to build.

The series of articles for the beginner just concluded in last month's *QST*, and many other *QST* features now on the way, will help the cause along. If you're the type that refuses to build his own gear, at long last some of our more enterprising manufacturers are bringing out some real 6-meter equipment. If you've always been going to give 6 a whirl, there'll never be a better time than now to get about it. Could be you'll like it!

### W2UK Closes Down

To do an outstanding job in any phase of amateur radio requires a combination of the best in equipment and skill in operating that comes only from experience. Some of us have one of these attributes, but we miss the upper brackets of achievement in our chosen fields of endeavor for the lack of the other. This is no less true in v.h.f. work than in other kinds of hamming. A fellow who has ranked high in DX work, for instance, is likely to make a pretty good v.h.f. man, if he is thoroughly bitten by the bug. At least one did.

The thrill of working in a fast-developing branch of the art caught the fancy of Ralph E. Thomas, W2UK, back in the early '30s. DX men of the prewar era don't need to have his record recounted, but some of today's DX enthusiasts might be interested to see what one of the country's leading v.h.f. operators did before he began to burn up the 2-meter band.

We've just come out from under a pile of old *QST*'s with the following record of DX Contest participation by W2UK. In the first contest in which there was a scoring system, back in 1933, W2UK placed third in the N.Y.C.-L.I. section in a field of about 30. In 1934 he rated 14th in the country, second in his ARRL section. The year 1935 found W2UK up to 5th in the U.S. standing, with his country total third in the nation. By 1936 Tommy was the top W2, landing in 3rd place in the national ranking. In 1937 he posted the country's top score in the c.w. competition and set a new countries-worked record with 71. His station, operated by another v.h.f. man to be, W2HNY, also made the top W2 score on 'phone. First place again, and another country record, 76, were achieved in 1938. The last DX contest of the prewar period found W2UK in third place nationally, just a whisker behind the two leaders, with 80 countries worked.

With this background, it is easy to see that W2UK was a sure bet to make his mark in v.h.f. work, once he tired of what he now calls the "d.c. bands." Tommy started in on 144 Mc. about five years ago with equipment not unlike that used by most 2-meter operators, then and now. His first 2-meter antenna was a 5-over-5, and his transmitter ran about 100 watts. He was just getting his feet wet taking a sampling to see if the 2-meter water was as fine as had been reported by some of his ham friends who were already in all over.

It was! Extended-range communication on a regular day-to-day basis was just getting under way on 144 Mc., and it appeared to W2UK, as to many of us, that pushing transmitter, receiver and antenna techniques to the limit would be bound to produce communication over distances then believed impossible on frequencies where ionospheric reflections were not involved. Before long the rig at New Brunswick, N. J., had been upped to a full kilowatt, and the antenna increased to 40 elements. Using c.w. mostly, and working in conjunction with W2AZL, W2NLY and others, Tommy was soon keeping reliable schedules on 2 at distances up to nearly 500 miles. His record of consistent schedules with W2ORI and W8WVX has never been equaled. And when the band was open, W2UK had a signal by which all other eastern stations were judged. By 1953, W2UK had assumed leadership of the W2s in states worked on 144 Mc., a position he shares today with two others.

In June of 1953, W2UK began what turned out to be one of the outstanding amateur projects of a v.h.f. nature of all time, the observation and recording of meteor-scatter signals on 144 Mc. Working with W4HHK, Collierville, Tenn., he spent literally hundreds of hours keeping schedules at all hours of the day and night. This work, reported in detail in October, 1954, *QST*, resulted in widespread attention of the most favorable sort being focused on amateur radio.

In the course of their daily schedules, W4HHK and W2UK proved that meteor-reflected signals from distances of 1000 miles or more could be detected consistently, with the duration of signal bursts occasionally reaching proportions that permitted the exchange of useful information. Thus was opened to v.h.f. men a wholly new means of making distant contacts.

The W4HHK-W2UK schedules came to a close June 5th, after exactly two years of the most intensive kind of work it has been our pleasure to report. The June V.H.F. Party was W2UK's closing fling. Though busy preparing

One of the reasons for the outstanding 2-meter signal radiated by W2UK was this 64-element array atop an 85-foot pole. Four 16-element Yagis, stacked two wavelengths vertically and one wavelength horizontally, survived hurricane winds that wrecked many lesser antenna systems. Another 2-meter array at W2UK had eight 5-element Yagis spaced one wavelength in both dimensions, four bays high and two wide.

**QST for**

for his departure for KH6, he found time to work 127 stations in 19 ARRL sections on 144 Mc. for 2413 points. This section total is at least 5 better than anyone else in the country was able to do on 144 Mc., even working the whole contest period.

The famous station at New Brunswick is now dismantled, but much of it is on the way to Kahuku, on the northeastern side of Oahu in the Hawaiian Islands, where Tommy will soon be taking up his new job with RCA Communications at their Kahuku transmitting station. Two-meter signals across the Pacific? We cannot escape the feeling that, if the job is to be done, here is the man to do it. One thing seems certain, at least: 2-meter interest, now just gaining a foothold in KH6-land, is due for a big boost. And while v.h.f. men everywhere will feel the loss of W2UK, they wait expectantly for 2-meter developments from Hawaii. Not the least of the possibilities: The same moon shines on both KH6 and W. 'Nuff sed!

### National V.H.F. Calling Channels?

If you've done much mobile work on the v.h.f. bands, you've probably thought many times how nice it would be if we had some sort of national calling frequency for the 6- and 2-meter bands. There's little need for this in areas where v.h.f. activity is high, but it would be convenient, when traveling in the hinterlands, to be able to set one's receiver on an appointed channel and be sure of hearing a signal if there is one to be heard. The question is "What frequency?"

There was some attempt in the heyday of the RASO work on 6 to make 50.1 Mc. a national calling frequency. There are plenty of crystals (8350 kc.) for this frequency extant, and it gets quite a play when the band is open. Trouble is, no channel ever seems to be used as a calling frequency only, even on lower bands, where such things are supposed to be standard practice. Would v.h.f. men around the country use one frequency for calling and another for carrying on a contact, once made?

We doubt it, from long experience in such matters shows that only a very few ever know that the arrangement exists. Still, there's no harm in trying. Let's make it 50.1 Mc. for calling, unless someone has a better suggestion. (It would help if the "beacon" stations would scatter around a bit.) What will it be in the 2-meter band? Offhand, we'd suggest 144.6 Mc. This is a popular surplus-crystal spot, and out of the low-edge QRM area. Can anyone suggest a better channel? Thanks to W6BCX for bringing the matter up.

### Here and There on the V.H.F. Bands

Expedition news that just missed last month's column: On May 28th, W6LIT and W6UID joined forces to provide Utah contacts on 144 Mc. for several W6s and W7s. They tried to reach Brianhead Mountain, an 11,315-foot elevation, but the road was still snowed in, so they had to settle for Zion Canyon View. This is a 9500-foot spot 18 miles east of Cedar City, Utah, and 45 miles north of the Utah-

Arizona border. Equipment was a 3E29 final stage, running 130 watts input on c.w., a crystal-controlled converter and BC-348 receiver, and an 8-element (W6GD type) horizontal array. Power was supplied by a gas-engine generator. Stations worked included W7VMP, Phoenix, Ariz., 300 miles, W7LEE, Parker, Ariz., 250 miles, and W6WSQ/6, 12 miles from his home in Pasadena, 375 miles.

The following morning they set up at Castle Cliff, a 3000-foot elevation about 7 miles inside the Utah boundary. Here they worked W6DNG, Compton, Calif., about 350 miles, and W6WSQ/6 again. W6DNG was the only home station worked in California, yet his signal peaked S7. The location of W6DNG is only 88 feet above sea level. W6NLZ was heard, but contact could not be completed. Polarization checks were made with W6WSQ/6, with no marked difference being observed between horizontal and vertical. A final stop at Wilson Pass, Nev., and several W6 contacts, completed the week end's work.

The W7VMP schedules, reported in May QST, have been kept regularly, but without significant results except with W5FAG, Albuquerque, N. Mex., and W6WSQ. These are mountainous paths of about 350 miles, in nearly opposite directions from Phoenix. W5FAG is heard on nearly every try, though two-way contacts have not been made regularly. W6WSQ is worked consistently, with barely-audible c.w. signals. Indications are that this path can be covered at just about any time, when high power, good receivers, large antennas and c.w. are employed. There are few rougher paths of 350 miles anywhere.

Perhaps the most pretensions v.h.f. expedition of all was just beginning to pay off as we write. W2QCY 7, complete with panel truck, a.c. generator, 45 watts output on 50 Mc., converter, receiver and beam antenna (not to mention low-frequency gear for liaison) was set up and ready for business at Wendover, Utah, June 22nd. Wendover being only 3 miles from the Nevada border, plans are to operate in both these rare states when the band is open. This trip of several thousand miles, months in the preparation stages, was made expressly for the purpose of providing eastern 6-meter men with a chance at Utah and Nevada, the two states now needed by just about everyone who lives east of the single-hop range.

The traditional late-June double-hop sessions produced hundreds of contacts for W2QCY 7, and for a similarly-equipped panel-truck station, W6ABN 7, Las Vegas, Nevada. Stan was busy for hours on June 26th, working W1s, 2s, 3s and 4s as fast as he could. We expect a flood of 50-Mc. WAS applications, as the result of the splendid job these two crews have done for the 6-meter gang. Those Nevada and Utah contacts have been a long time coming!

Interisland 2-meter contacts in KH6 are reported by KH6AED, Hawaii SCM. The first was made on the morning of June 5th, between the home station of KH6AED on Oahu, and KH6ELD, mobile, on Maui. The latter was atop Lookout Point, a 10,000-foot elevation at the top of Haleakala, the volcano crater on Maui.

Ralph E. Thomas, W2UK, at the controls of his 2-meter station at New Brunswick, N. J. Equipment included a 144-Mc. crystal-controlled converter, working into a BC-342, left, for quick band-scanning, or into an SX-88 for weak-signal DX hunting. At the right is the kilowatt rig for 144 Mc. Similar shots of W2UK can be found in the DX Contest write-ups of pre-war QSTs.

Odd-propagation department: W2ALR, Lockport, N. Y., heard the 2-meter 'phone signal of W1DXE, West Hartford, 325 miles, during the widespread aura of May 25th. There was only a slight rumble on the signal, and it was perfectly readable. This was about 8 p.m., when the c.w. signals from the aura were at their peak strength. There was no evidence of a tropospheric opening at the time. Just a few nights previously, Larry heard a pronounced echo on the c.w. signal of W2UK, when he was in contact with W2ORI, Lockport. The delay was estimated at 50 milliseconds. Question is, where was W2UK's signal going to give it a 10,000-mile echo?

DX chances lost: On the morning of June 5th, your conductor heard the 50-Mc. signal of W6ABN for a period of an hour or more, rolling in about as well as we've ever heard a West Coast signal on 6. W6ABN was knocking off the W2s and 3s rapidly, but no W1s. How widespread the skip was at that time is seen from the TV DX observations of K6EDX, Fresno, Calif., for the same period. Bob reports

that between 0630 and 1430 PST he picked up Baltimore, Norfolk, Va., Tulsa, Philadelphia, Washington, New York, Chicago, Montpelier, Vt., Kansas City, Kalamazoo, Mich., Rochester, Great Bend, Kans., Omaha, Green Bay, Wisc., Wichita Falls, Texas, Spokane, Wash., and Great Falls, Mont., on TV channels 2 through 5! Sporadic-E skip begins on lower frequencies, and goes higher; that is, the 50-Mc. band is open before, during, and after the TV channels. There was quite a bit of DX worked on 6 at that period, but the stuff on the TV frequencies gives some idea of what 6 might have been like if we had activity over the country in anything approaching 75-meter proportions!

### Horizontal Antennas for 2-Meter Mobile

In open country, at least, it's helpful to have the polarization matched between mobile and fixed stations. The general swing to horizontal has resulted in scores of ideas for horizontal mobile antennas. W2OW, Vestal, N. Y., has had fine results with a folded dipole taped to the rear window of his car. This can be fed with coax through a balun, or used with a balanced line. The dipole can be made of Twin-Lead, or of fine wire, the latter having the advantage of being almost invisible from even a short distance away from the car.

W9ULF, Oak Park, Ill., has a demountable set-up that has considerable merit. He cut a piece of 3/4-inch copper tubing one foot long, and bent it at the center so that when the lower portion is parallel to the door jamb of his car, the upper half is vertical. Two clips of thin sheet metal hold this tube in place, with self-tapping screws inserted into the door jamb. The copper tubing can be chromium plated, or painted to match the car, after which it is a nearly invisible socket for holding a removable mobile dipole.

The dipole itself consists of two 19-inch stiff wires, inserted in a triangular-shaped block of polystyrene. This mount is fitted over the top of a 1/4-inch aluminum rod 19 inches long, which is inserted into the socket when mobile work is in prospect. The dipole is fed with coax directly. A balun was tried, but with the short run of coax involved, it made no practical improvement in performance. The coax is 65 inches long.

If there is a tendency to rotation of the dipole when the car is moving, the vertical support can be wrapped in friction tape. Pushing it down in the socket tightly will hold it in position firmly.

### OES Notes

W2UTH, Victor, N. Y. — Many new stations coming on 6, some at the expense of 220 and 420 Mc.

W3OTC, Silver Spring, Md. — Appearance of Technicians on 50 Mc. is the best thing that's happened to the band in many a year. A high percentage of DX stations worked appear to be newcomers, and activity is well above recent years.

W4KKK, Rome, Ga. — Have 807 working fine as straight-through amplifier on 50 Mc., driven by 12BH7 as push-push doubler. A pi network is used for interstage coupling, with a 20- $\mu\mu\text{f}$ . variable capacitor on the 12BH7 end of the coil and a 40- $\mu\mu\text{f}$ . fixed capacitor at the 807 grid. The coil is 7 turns, 1/2-inch diameter, 3/4 inch long. The 807 is mounted in a shield made from a small can of the frozen fruit juice variety. No socket is used, contact being made to the 807 with pins removed from an old wafer socket. The cathode pin and one heater pin are soldered to the can. The 807 plate tuning capacitor is a neutralizing unit from a BC-375. With the tube mounted horizontally, a short heavy lead connects from the capacitor to the 807 plate cap, and the plate coil is at the far end of the capacitor. The effectiveness of the by-pass at the cold end of the 807 plate coil was improved by enclosing it in sheet aluminum. The amplifier is completely stable at all settings of the tuning controls, and no parasitic chokes are needed. It runs nicely at 65 watts input, with 650 volts on the plate.

With phase modulation most Channel 2 TVI that developed with a.m. is cleared. The closest receivers can be handled nicely with a W2IDZ filter. See July, 1954, QST, page 33, for details.

W5FPB, Albuquerque, N. Mex. — New V.H.F. Club now officially organized, with W5FAC as president, W5VWU, vice president, W5FJE, secretary-treasurer, and W5ECS, activities manager. Working with local e.d. officials and

# How's DX?

CONDUCTED BY ROD NEWKIRK,\* W9BRD

## Who's Where:

This being a prime vacation month we'll dispense with our usual abstruse DXhortation and choose instead to help beef up your DX reference library. Avid DXers en route DXCC haven't much time to sit around indexing their QST files and questions like "Now where did I see a picture of FG7XB?" often arise. So, as an excerpt from records that Jeeves maintains for our own convenience, here's a tabulation of photography that appeared in "How's DX?" over the past three years (asterisks denote equipment only):

## 1952

*July:* GM2DBX; PY2CK, W1ZD; VP5s BD BE BH BP; KW6AR.\* *August:* AP2N, VU2DY; HZ1KE; MI3US ops. *September:* AC3PT; W1FH; VQ4ERR, ZS6Z, MI3US.\* *October:* JA2KW ops; VK1BS; ZL1MP.\* *November:* ZS6BW; PY2RT; KG4AF; DL4JN. *December:* DU1CE; JA6AA; VP9OO; EA2s CA CQ; KA2KW.\*

## 1953

*January:* HK ops; VP3LF; OX3SF; HB9GJ. *February:* IS1AHK; OE13JR; Mass. DXCC ops; PY1DD; TI2s BR DL PZ TY. *March:* CP1BX; 984AX; MP4KAC; KC6QL; ZS3G.\* *April:* LZ1KAB; CT1CL; SM5s LI RM, 4X4BX; KB6AY\*; KL7AFR. *May:* VK3HW; V89AW; ZM6AX; VP8AE\*; JA1AH. *June:* CE3CB; KG6HL, W1FH, W6LW\*; ZS2MI\*; DL1EZ. *July:* PY2CK; YV5FL; ZL2AV; W1MCW; W2AOS/KG6. *August:* AC4YN; CR3AC; PY2CK\*; CR6AI; KP4UB; VESBV. *September:* LU4ZI; IT1TAI; SV0WVG; YU1BCD. *October:* SM5KP; MP4BAF; PY4HE; KR6s LL LW; V86BE. *November:* HB1JJ/HE; FO8AI; KV4BB; HZ1AB ops; ZS6DW. *December:* ZL1HY; EA1AB; IIAOF; ON4NC; 4X4BR; DU7SV.

## 1954

*January:* JY1US; EA9DD; PY1AA ops, W3BSO. *February:* KJ6AY; ZE3JP; KF3AB; KH6MG; WIATE; W9DXCC ops. *March:* FKSAB; OQ0FG; VS2DB; ZK1BG; SP2KAC\*; G3IDC; OQ3NK. *April:* KG6AEN; KA9LJ; KA7RC; KX6BU; ZE (LMIRE) ops; W9AND; KR6s AZ BA IT. *May:* CR6CZ; KA2HQ ops; EA9s DE DF; ZL2JB. *June:* HH2OT; PZIWX, W2BVS; VQ2W; CX5AF\*; ZC4s CA FB GF JJ PB. *July:* NE1NMC; CT2AG; ZB2A.\* *August:* Dayton Hamvention DXCC ops; GM8MN, W1 friends; TA3AA; HK1TH; HB1KB, HB9s KB RQ; VK9OK.\* *September:* HZ1AF, W2XXM; ZL1CI\*; KL7PI. *October:* W6TI's QSL bureau; F8FW/FC, F9QV, HB9LA; GM3DHD. *November:* ZK1s AA AB BG BH BI; W2MHQ\*; KA4MA, KA2DX, KA8AB; CN8MM. *December:* ON4VY; OQ5ZZ ops; MP4QAH\*; EA6AW; HK0AL.

## 1955

*January:* DU1CV; VE7ASL (ex-VR2CD); JA6AD; HB1MX/HE; YU1GM, OZ1FM, SV1SP, G2MI, DL1DH, OE5HN. *February:* GB3NCB; VS6AE, W0YDZ; HB9X; CR8AB\*; KC6KU. *March:* CT1CB; FB8BC; W0YDZ; KG6\*; FG7XB; VESs OG SD SM YT ops. *April:* FP8AK/VP2, VP2VA; W2ZIK, ZL2s ASL GQ JF; DU6RG; K6EUV\*; SM5ARL\*; Famagusta ZC4 ops. *May:* CN8ML; SM5RM; XZ2OM; HA5KBA.\* *June:* G3AAT/OX; CR7CI; VP1GG; OY7ML.\*

It's only fitting that we recap credits, too.

\* Please mail all reports of DX activity to DX Editor Newkirk at 4128 North Tripp Ave., Chicago 41, Illinois.

Here are the guys and groups that were good enough to entertain you by the loan of those pic:

W1s APC FH NWO WTE, ARRL Hq, W1s, W2s A1S ESO HK HOB MUM TXB; W3s ANT VES/1; W4s BEW HYW TJ YZC; W5s KUC M1S UUK; W6s BES EAY GPB MUR YY; W8s IV SHW YJB; W9s BDW FKZ HLE MQK RBI TRD; W0s AJL VFM, CT1CB, DU7SV, DL4LQ, Gs 2MI 4ZU, HB9CZ, HE9RDX, KC4AB-W1QCW, KH6ALM, KL7AFR, LU5CK, VP3WO, YU1AD, ZS6BW, 984AX, No. Calif. DX Club, W. Gulf DX Club, Salt Creek Radio Club (W9AV), RSCB, USKA, National Geographic Society; Portland Oregonian and Chicago Tribune.

If, as the Chinese long ago put it, each pic is worth more than 10,000 words, these parties turned in plenty of DX column copy during those past 36 months. Our efforts to document doings in the DX world are greatly enhanced by such coöperation. A special salute to OT contributors *au fait* W6YY and W8IV who helped doll up three separate DX columns since July, 1952.

Incidentally, for the statistically inclined, it is of interest to note that a check with the ARRL DXCC Countries List reveals more than 100 countries represented in the preceding photo index. That's a fairly fast DXCC for your "How's" picture gallery!

## What:

Time was when July and August were one-band months so far as the northern latitudes world of DX is concerned. The band, of course, was 20. Thanks to the happy acquirement of a 15-meter band and an assist from the valley of the solar cycle, North American amateurs now get hot-weather DXercise on a variety of frequencies. Hop on our "How's" Bandwagon and see for yourself, OM, bearing in mind that in the text to follow, frequencies (given in number of kc. above the lower band-limit) appear in parentheses, times without. E.g., (9) = 14,009 kc., if the paragraph deals with 20-meter work. Times are GMT, using the nearest whole-hour figure such as 7 for 0720 or 0650, 0 for 0015 or 2349. As a rule each DX call is mentioned but once per band.

SM2VP's Piteå, Sweden, hamshack displays a severe Scandinavian motif. An ARRL member since 1930, Helmer usually can be found on 14,080 kc. on week ends, with p.p. RK20As feeding a rhombic and other long-wire antennae. The receiver is an NC-1B3D.

**20** 'phone is a good starting pointing for our megacycling and WACVX give us part of the reason why: **FP8AP**, **H8C8I** of the Galapagos, **HK0AI** (188) 16, **OD5AB** (121) 2-3, **TF2WAI** (130) 15, **VP5AE**, **ZB3 IAAX** and **ZB2A**. Tommy's new Telrex drove his 150-watter home to 70 fast A3 countries. . . . **KG4AP** (W4DNE) ran down **DUT8F** (184) 14-15, **H06EC**, **KA0IJ** (190) 13 of Iwo Jima, **KG1AA** (240) 23, **VR3 2AP** (150) 4 and 3C. . . . **W9RBI**'s recent 60-minute 14-Mc. 'phone WAC -- **ZS6QW**, **KA3JN**, **W3JNN**, **LU5NE**, **DL4RM** and **VK2AFS** -- adds to the stack of evidence on hand indicating the early return of a more cooperative Kennelly-Heaviside stratum. . . . **W7VMP**, whose two triplet brothers also have calls, forsook 144 Mc. in order to capture **DUIVVS** (170) 15, **F08AK** (160) 1-3, **VR2s** CW 4, **CZ** 4, **VSs** ICZ 12 and **4CT** (120-180) 14. Bob and **W9RBI** were among the fortunate to work **V54CT** (G3DCT) as **V55CT** before he shut down his Brunel installation in favor of Sarawak diggings. . . . **BV1US** (250) 13-15 continues to make firings and influence people, **KL7ZG**, **Ws 6YY** **SYIN** 9FDX 9GPI 9RBI and 9WHM are included in the many who'll receive that Formosa QSL. . . . **W9WHM** was the first Hoosier QSO for **CG6CG** (260) 9. John also contacted **FY7YE**, **KX6BU** (240) 7, **TA3US** (107) 22-3, while **YI3AM** and **YK1AE** escaped. . . . **AP2U** 15, **JAG6IK**, **LZ1KSA** 14, **OE13USA** 14, **ST3s** AM 17, **DB** 17, **SU1CN** 20, **SV0WK** 16, **VS1FS** (111) 15 and **4S7MG** 13 vocalized with **IIZ1AB**. . . . **Serumptions ACs** 3PT (114) 14 and 5SQ (114) 14 raised the eyebrows of **W6YY**. . . . **F08AB** (30) 4, **OY2Z** (182) 19, **VK9RM** (164) 11, **VR6AC** (142) 2-4 and others are listed in the Milwaukee Radio Amateurs' Club DX newsletter. . . . Northern and Southern California DX Clubs and the West Gulf DX Club list the following collection of 14-Mc. radiotelephones, the latter outfit contributing the lion's share: **DUIVCY** (199) 15, **ET2s** WS (173) 18, **XX** (184) 4, **FA3ZG** (136), **FB8AM**, **F08AD** (30) 6, **CG6FQ** (166) 15, **GD2FRV** (140) 7, **HO1EH** (77) 1 -- see "Whence", **HZ1s** AB (107) 0, **TA** (134) 0, **CG6AJ** (207) 11, **KG1Bs** BO (235) 3-4, **FR**, **KM6AX** (209) 6, **KR6s** KS (175) 13, **LJ** (121) 13, **NP** (175) 11-12, **PI** (175) 11-12, **MP4QAI** (143) 3, **OD5AD** (119) 3, **OK1MB** (138) 4, **OQ5s** FO (131) 20, **PE** (131) 22, **SP5AH** (110) 12, **SV8s** WM (120) 19-20, **WS** (109) 1, **TF2WAG** (161) 15, **W4IC** (132) 7 of Willis Islet, **VK9s** GV (115) 7, **MX** (176) 7, **OK** (126) 6, **RH** (130) 2, **VQs** 4FK (115) 12, **5FS** (154) 20-21, **VR2s** AA (138) 16, **AM** (342) 5, **VS1s** AD (110) 15, **FJ** (180) 15, **FO** (109) 15-16, **FU** (180) 15, **GT** (161) 15, **EW** (232) 15, **VS2s** DB (187) 15, **DQ** (151) 15, **DS** (170) 16, **DT** (178) 15, **DY** (127) 14-15, **DZ** (170) 14-16, **EF** (249) 5, **VS6s** AE (101) 15, **BE** (111) 15, **CL** (110) 13, **CW** (170) 15, **VU2s** CT (137) 15, **ET** (187) 17, **FX** (122) 16-17, **YO3GM** (130) 2-3, **YI1GM** (110) 3, **ZD3BFC** (105) 18-19, **ZK1BI** (178) 16, **ZM6s** AR (152) 5, **AS** (160) 5, **AZ** (160) 5, **ZP5AY** (163) 0, **ZS3AB** (138) 18, **3V8s** AS (189) 3, **WK** (165) 6, **4S7SL** (167) 14, **4X4s** DK (150) 21, **FQ** (153) 4 and **5A4TU** (120) 20. . . . 20-meter A3 vigilance by *Newark News* Radio Club vigilantes culminated in the logging of **G3VA** (205), **CPs** 4DF 5EK (160) 23, **CR6AF**, **CS3AC** (305) of Azores, **DUIAF**, **ESs** 8AP 8BK 9AR (145), 9BC 9BH (165) 21, **ET2AB**, **FASAG** (195) 7-8, **FM7WQ** (130), **FR7ZA** (115) 14-15, **HBI1MX**, **HGs** 6CR 81N (160) 3, **HUs** 2LR 2PB 3L, **HK6s** ES FI, **HR3HH**, **ITBEXN**, **KC6UA**, **KG6s** AA NAA 3, SB of Saipan, **KH6ABH** on French Frigate Shoals, **KR6s** AB AF AI 12, **DQ** NK OO PR TI USA, **KT1s** DD WX (210), **KV4AA**, **KW6BB**, **LX11D** 22, **MP4NL**, **OQs** 5FN 6DZ, **TA1AI**, **TF2WAF** 22, **TG9s** KF (190), **RR TU**, **VK9DB**, **VPs** 1AB (185), **2DN** (14) 1, **2GW**, **7NI** 7NJ 7NS (145), **VR2AP**, **VQ4s** EU FQ, **VSs** 1BA 2DC (181), **2UW** (190), **W9RJV**, **VES** at Resolution Island, **YI2AM** 0, **YS1s** JR (195), **MS**, **ZB2A**, **ZD4s** BR BT, **ZM6AT** (160) 5-8, **ZS2MI** on Marion, **4S7YL**, **4X4s** BG 0, **CR** (185) 0, **CX** GB, **5As** 1TK 2TJ 23, 2TZ 23, **9S4s** AC (150) 22, AD 23 and BS (131) 0. Twenty-'phone WAC should be a snap with all these Japan actives specified available by NNRC: **JAs** 1ANR 1GV 1MP 1 MR 1MT 3BB 4BB 4JH 5AF 6AA 6HK 8AA 8AA 8AA, **KAs** 2AJ 2CC 2CY 2EAE 2GE 2GE 2WJ 2WJ 2K 2NA 2OG 2OJ 2RM 2RR 2SM 2SV 2VS 2WW 2YA 3EB

**20** c.w. deals them off the third or fourth layer and has many an ace up its raveled sleeve. With 250 watts on an 810 he's been using since 1938 **W0ELA** reeled in **MP4s** JO (40) 4, **QAL** (75) 3, **VQ6LQ** (66) 0, **YJ1DL** (6) 4, **ZDs** 3A (60) 23 and 8AA (4) 23. . . . **W8YIN** got that **ZD3** as well as **ZM6AS** (68) 5. Mickey notes that **ZD3A** begins tuning 30 kc. below his frequency while the **ZM6** prefers calls 10 or 15 kc. higher than zero. . . . **FK8AE** (65) 4, **F08AK** (85) 2-3, **H8NU** of Trieste, **JZ0PS** (34) 16, **SP9KAS** (44) 4-5, **VK9AU** (32) 12-13, **VRs** 2AB 3, 6AC, **VU2AS** (16) 15, **9S4AX** (30) 15-16, **W7VMD/KG6** and **W0LKO/KG6** worked Arizona's **W7VMP**. . . . **W1OJR** tangled with **FY7YE** (80) 22, **GD3s** IBQ (60) 21, **IYS** (60) 22, **UB** (40) 16-17, **JA9BE** (55) 12, **KAs** 2CR (60) 12-13, **2OJ** (70) 13, **5HM** (82) 12, **SPs** 5AA (60) 20-21, **SKAF** (52) 1-2 and **SU1IC** (62) 2-3 who says he's the only legit Egyptian station active. **W1OJR** adds one **DXF-1** and another **ZP6CR** to the question-mark list. Vie pats gadabout **W6BYB** on the back for snappy Caribbean-style **DXtra**circular work at **FM7s** WD WF, **FY7YE**, **FG7XB**, etc. . . . **W4QCW** (**KC4AB**) did all right on **KW6BB** (30) 13-17, **OY2Z** (51) 4-13, an **MP4**, **UQ2AN** (56) 12, **VK9OQ** (20) 7-12 and **VS6CG** (84) 14. Bob decries certain hoghish members of the **QRO** contingent who must demonstrate how well they get out by repeatedly working a juicy one for the purposeless exchange of RSTs and inane clichés. . . . **W9BZW** is a new customer who reports raising **EL2C** (68) 22, **FA9VN** (24) 0, **HK0AI** (53) 0, **OA4J** (87) 3 and **OK/YUS**. George measures his shortie 3-el. rotary at 5 db. forward and 25 db. front-to-back -- not bad! . . . **VP9BM**, of **W8OSL** and Turkey fame, clobbered **ESs** 9AP (61) 22, 6AC, **FD8AC** (1) (63) 23-0, **F08AB**, **HG1FG**, a Qatar **MP4**, **VK9DT**, **VU2RC** (57) 2, an **OY** and **4S7WP** (33) 4. Jules noticed that the **FD8** slipped and started to sign another call on come-back. . . . **CO2YB**, **KL7AON** and **3V8AN** (50) 21 are good catches from **HZ1AB**'s bailiwick. . . . **W1WAI** got back in action for **CR4AF** (45) 23-1, **FG7XB** (91) 18, **15LV** (88) 14-19, **KG1IB** (**W1KWM**) (66) 23, **LZ1KSI** (64) 22-23, **VQ5FS** (46) 19-22, **YO3RF** (75) 19, **3V8AB** (30) 22 and **4X4FK** (50) 0. . . . Improved 14-Mc. conditions inspired **K6ENX** to trap East German **DM2ABK** (60) 6-7, **DUIVCY** (60) 15-16, **FY7YF** (5) 2, a Trieste **II**, **JZ0KS** (70) 17, **KG1AA** (40) 5, **VP1FL** (60) 15, **VP8BD** (50) 15, **VSs** 1GJ (55) 15-16, **IG1** (50) 15, **1GS** (90) 16, **2EM** (65) 15-16, **6CR** (80) 2, **VU2ET** (50) 15 and **4S7KH** (60) 15-16. . . . **K2BZT** switched allegiance from 80 to 20 meters, and small wonder: **FB8AK** (7) 17, **FF8AJ** (60) 21, **F08AL** (39) 1, **GM3s** AM (70) 22 and **GZA** (20) 1 of the Hebrides, **HAs** 5BU (77) 23, **5KBK** (63) 23, **7OL** (17) 1, **JAs** 2CZ (68) 15, **3DY** (20) 14, **5AB** (50) 14, **7AD** (62) 13, **9CW** (85) 12, Aaland **OHs**, **UA4KPA** (17) 20, **YO3RZ** (44) 21, one **ZAIKAD** (14) 23, **ZC4s** IP (10) 21, **VP** (70) 19, **4X4s** BR (85) 20, **BT** (80-95) 20, **FF** (92) 22, **FR** (90) 23, **IE** (49) 20-21 and aforementioned **EL FY7** 15 **LZ VQ6** **ZD3** items. Hayden is sporting Worked Vermont Certificate No. 43, "Which means they're a darned sight rarer than DXCC!" . . . **W0DBX** fled away **F9YFP** (31) 21, **FB8BR** (50-74) 13-14, **JAs** BR CA 14, **KG6AFT** 14-15, **W6TMM/KG6** 13, **TA3US**, **VK1IV** 7, **VS6s** AE (88) 13, **CW** (93) 13, **DB** DE (48) 13, **ZD9AB**, **ZP5EC** 15, **4S7NG** 13 and **9S4BN** 17. . . . **W0VFM** caught **CN8ED** 21, **EA6AU** 21 of the Balearics, **HR1MC** 17 and **TF3AB**. . . . At **W4YZC** we find the scraps of **CX1FB** 23, **JA6s** AA 1HK 12, **LZ1KAB** (60) 2, **SV1SP** (19) 4-22, **ZG4GF** 20 and **4X4BD**. . . . **KA7DM** (10) 3, **KM6AX** (64) 3 and **KR6OO** (60) 4 came back to **W7UJL**. . . . **W7TMI** does a good job out in the DX badlands: **CN8EB** 3, **DM2ABL** 6, **FM7W7** 22, **JAs** IACA 7, 1GW 9, 7DK 6, **KA2CG** 8, **KJ6BH** (87) 3-4, **TF3ZM** 3, **VPs** 6KL 5, 7NZ 1, **ZP5GM** 2, and **FG7 FO8 II**/Trieste **V81 VS6** **YO** 984 trophies attend. . . . **JA6AD**, who lends his communications talents to Nagasaki Radio, mentions working **EA9AB**, **MP4BBE**, **SU1SB**, **SVs** 1AB 6WR, **TF5TP**, **V08GB** (90) 16 and **ZD2HAI**. . . . **W0UKG** scraped up **CE7AK**, **HA5BL**, **LX1CW**, **SP9KAD** (40) 20-22, **Turks VP5s** BM (13) 19, **DC** (25) 2, **ZB1DK**, a **4X4** and suspect

3A2 to reach 128/117. FB8XX, FQ8AA, LUIZG and several U stations weren't having any. For a little DX excitement Doug digs into pile-ups with his 28-watt 2E26 exciter although the 813 stands by for rough going. . . . . Seven short months on 20 c.w. resulted in 116 countries for K2GMO. Bob's latest successes include CP5EP (3) 21, ET3LF (35) 18, FF8AC (30) 20, HA7KLA (60) 18, HE9LAA (51) 21 of Liechtenstein, HZ1HZ (44) 20, an armful of JA/KAs, KG6NAB (62) 11, OY7ML (25) 20, VP2GW (87) 22, VQ4FM (10) 17, 4X4s CK (25) 21 and FQ (44) 21. . . . . SP6WF, TF3KA, YO5LD, YV3FS and 5A4TK are among W3UX's shiny collection. Jon also bumped into 4X4CR/MM, Swiss Army station HB4FE, Swiss aircraft HB1QN and K4A19G/AM in a U. S. Navy blimp. . . . . Gleanings from logs in this slack and that slack, at W1YLM: VK9GB (49) 13, W3GVZ: Aaland OH1s, VS1 VQ5 VQ6, suspect PX1AA, ditto YA6s BBR GAL, W2TKG: YN1PM, HK9, K2BKU: EA9DE 22, K2EUH: HB1HT, KG1, KG4AB, PJ2CJ, VP7NX, K2HZZ: SL5AN of the Swedish military, W3TTH: IS1CFC, XE1H for a fast QSL; needs dope on W0WLO/SV2, W4TTP: LA4RE, who says LB8VB should be back at it from Spitzie by now, W5CAV: DM2ADL, DUICV, HBLF (50) 10 of Trieste, JA1AH, OA5B, VEAPX, YN1KK, YV5AE, W5HTS: DU7, TI2CR; heard VR2AR (5) 3, W6NJU: Trieste, OE5BW, VR2BZ (60) 6, a Thule KG1, YU2GW, OH5NR/MM off Ceylon, W6QAR: the preceding maritime-mobile OH5 who runs but 5 watts to a 2516 hnal around 14,100 kc, W6Y1Y: KP6AK, whose Palmyra QSL reads, "Population 1—Me," W3BJ3: CR4AO, ET2MK, W0UWV: IT1TAI 1, SV9WT (80) 23, LZJZC: FR7ZA 16, UG6KAA 12, VK1EM 17, YK1AH 16, one ZA2B 16-17, ZD9AC 18-19, KL7BBV: FO8AL, KC6AJ's Heathkit 25-watter. . . . . WGDXC's DX Bulletin supplies us with 14-Mc. c.w. notes on AP2Y (80) 1-2, CRs 4AL, 6CG (43) 22, 7AD (48) 13, 8AB (20-60) 2, 9AE (85) 7, 9AI, 10AN, CT3AB (32) 19, FF8AP (80) 1, FK8s AH (62) 4, AJ (9) 6, FU8AA, FW8s AA AB, HB1RM (50) 23, IS1AHK (3) 22, KC6AI (42) 5, KR6s AB (80) 18, AP (50) 11, LJ (40) 13, OL (55) 14, USA (10) 18, K1EXO (46) (23-0), LX1RB (100) 15-16, LZ1KAA (70) 5, SPs 1KAA (80) 22, C1 (13) 0, 9KJS (57) 12, ST2AC (5) 23, TF3MB (10) 1, VK9RM (9) 13, VP3YG (2) 0, VS1s BJ (81) 13, BL (48) 13, EI (94) 15, GI (32) (2) 0, VS1s CH (45) 16, CV (43) 15, DF (74) 1-2, DW (14) 15, VS2s CH (45) 16, DD (70) 15-16, VS6s CQ (22) 12, CT (15) 15, EI (87) 15, EQ (70) 15-16, VS6s CQ (22) 12, CT (15) 13, DC (2) 14, DD (18) 14, DC (2) 14, OD (52) 14, VS9AF (34) 23, VU2s CY (80) 16, MA (60) 19, NR (50) 20, YO3AR (50) 18, ZCs 2PJ (81) 22, 3AC (74-80) 15, 4NFD (38) 20, ZDs 2WAF, 4AQ (50) 19, 6BX (73) 12, 6RM (64) 12, ZK1AB, one 3A2AM, 4S7GE (70) 16, 4X4s AE (64) 23 and H (40) 22. So much for the Hot Slot. . . .

**15 c.w.** DX possibilities are gaied by several Novices this month. KN2KHZ's Globe Scout, NC-98 and 70-foot wire had a hot time with Gs 5FA 0, 6RC 0, GW3YR 1, KP4ZA 0-1 and LU1DFH 2. . . . . KN4BBR was delighted by LU1EK's reply. . . . . WN3ZKII made it 17 countries on four continents by way of DJ1VL, DL6s GB KF, DL7BA, FSTQ, G5CR, KG4AV, LU7s 7FAL RDDH 9DAZ, OK1IH and YN1AA. . . . . Back with the General genre, KR6LJ enjoys 21-Mc. c.w. and writes of many European QSOs, DM2ABL, FASRJ and JA1ACA. Frank was intrigued to note that DU7SV's favorite frequencies, as listed recently in "How's", jibe precisely with his own. KR6LJ lays the blame on the oodles of war-surplus SCR-399 crystals kits scattered around the globe—even U.S.S.R. hams cluster 'round 7020 and 14,040 kc. . . . . VK2GW and VP9BL make the 69th and 70th 15-meter c.w. countries for W1CTW. . . . . OA4C 14-15, PY7AN, SU1XN/ZC4 9-10, VS6s AE CQ CZ, YO3RF 15 and ZC4PB 12 show up on ZD6BX's scorecard. Vic states that ZS7C still flits about 21-Mc. radiotelegraph frequencies now and again.

**15 'phone** is going great guns. KL7ZG recommends CP5EK, OQ0DZ, VP5SC, VQ4EU, 4X4s BD and B1, to while away a Sunday afternoon. . . . . W7PEG picked up HC1RT, HR3HH, VK9DB (350), YV5AP and heard the voice of FM7WQ. . . . . W6ZZ, with 70 countries on 21 Mc. and 63 of those via A3, lists CE3QK, DL6TD, KP4WR, KV4BD, several KZ5s, YV5EW, ZLs

As VP8AQ in the bleak South Shetlands, Graham Davis whiles away long off-duty hours through contacts with ham acquaintances around the world. VP8AQ employs an RCA rig running 350 watts (250 watts on 'phone), a Marconi CR-100 receiver and radiates with a 90-foot wire on 7, 14 and 21 Mc. CR-100s do ham-band duty for many stations throughout the British Empire.

## CAUTION

Under this country's treaty obligations and on formal notice received from other nations, FCC-licensed amateurs are warned to engage in no communications with stations in the countries listed below. This is in accordance with FCC Public Notice of December 21, 1950 (p. 23, Feb., 1951 QST), and as since revised.

French Indo-China (Cambodia, Laos and Viet-Nam), Republic of Indonesia, Iran, Korea, Thailand. Prefixes to be avoided: F1S-X1S-31S, PK, EP-EQ, HL and HS.

280 4LA and these MMs: Ws 1Ks 10SF 1RZA 1UWV 30ZA and K2CIT. . . . . CT1OR, PZ1RM, ZB1CA and sundry Europeans replied to W4UWC. . . . . W4NQMI has 95 ARRL DXCC Countries List items checked off on 15 'phone after four months. E1SL, FY7YE, GD3IBQ, VP3VY and ZD9AC are among Sparky's latest. Friend W4WYM has 66 countries with a mere 35-watter and adds KT1WX and YN1LB to the 21-Mc. 'phone grab bag. . . . . CEs 2BO 2DD 3CZ 3H1 6AB, CN8s CG GL (185), CP5EQ/CP6, CR9AH, CT3AN 19, CXs 2AX 2CO 5AF 8AA, Eas 8AI (150), 9BC, FASRJ, FF8AP, H1s 2W 2X 7W (W6-style), HR1s CB LW KS, KV4BB, KW6BB, LX1BU 22, MP4KAC 22, OAs 2A 5G, OD5s AG AJ, OQ5s BI RU, TIs 2BX 2VJ 3LA, TG9AZ, SV8WO 21, VP8s 1EK 1SD (195), 2DN 2GE 4LL 4WL 5BD 5SC 6BS (198), 6FR 6GT 7NK 7NN 7NX, YS1RA, ZC4JA, ZDs 1SW 18-19, 4BK, ZPs 2CH 5CF 5GM 51B (420) 22, 5IM, 4X4s CX DK and 5A2CO are 15-meter radiotelephones spotted by NNRC's sharp ears.

**40 c.w.** gives a reasonable account of itself right through the thunderous season. K6EC recorded contacts with GR7s C1 (16) 6, CN (5) 6, several LUs, JZ0DN (10) 14, ZD6BX (17) 16 and ZE3JP (18) 7. Shipboard ops 8Ms 3AQD 6CWC and 7B1J paid Ev a personal visit when their *SMS Aelssnaben* dropped anchor in San Diego. . . . . VQ2EW, ZE2JC, ZS7D and 4S7NG broke through the W/K barrage to QSO ZD6BX on 40. . . . . 7-Mc. doings here and there, at K2HZZ: FASDA, TI2WR, XE1MJ, K2JCK: KG4AJ, KV4BK, VP7NM, YU1DYZ, W3TTH: LU1AP, ZE3, W5CAF: DU7SV and others. K6ID1: one CX1ADF (4) 2-3, W01BS: many VKs ZLS, CE7ZJ (5), LU8, W7AMA: YJ1DL (8), KL7BBV: FO8AL on Tubuai.

This is the slack season for 28- and 3.5-Mc. work but W2QHH reports catching VK9RH on 80 for his No. 113 on the band. . . . . NNRC constituents logged GT1PK, CX2CL, DJ2KG, DLs 4DS 6VM, EA7DI, FSPQ, I1THP, JA1s AGU AI, KZ5s galore, LUs likewise, OE1FF, PJ2s AC AP, TI3LA, VP8s 7NJ 9AY and 4X4DK sneaking through on 10 'phone during brief openings. . . . . Forty 'phone produced NNRC SWL cards en route VK2s AFC, AFF AIO ALL AQ AQF AVV JN LF LF LP CA SF WA, VK3s AAO ABI ALA AOA ASD ASF HK QP XI, VK4s AI AO AR BW CP DJ FT HD JR LL MO PR QR TK TS WI WR Y1 ZB ZM, VK5s JO NM RR SU, JA1s AGU AI ALR and JS, Fortv A3 has large crews performing Down Under and Up Over but the two groups seem to have an awful time getting together!

## Where:

W1WY receives assurance from ex-VK1AC, now VK3IB, that all VK1AC Macquarie QSOs will be confirmed. Chas. has been setting up housekeeping at the QTH to follow—patience, please. . . . . W4BRB wants it understood that at present he handles QSLs for no DX stations, despite recent rumors to the contrary. "When I do so I will advise in advance and in the legitimate manner." As we phrase these lines there are about six highly unusual call signs being bruited about on DX bands. Until somebody sees the color of their QSLs there's little logic in wasting much speculative space on them because there is already on hand a surfeit of solid, albeit less sensational, DX information to

An HT-9 rig and SX-71 inhaler are the nucleus of the layout with which KC6ZB passes out Yap Island QSOs on 14-Mc. 'phone. Ralph is on 20 almost daily and throws a stout signal Stardward with either a 3-element rotary beam or Vee array. (Photo via KC6AA)

disseminate. Suffice it to say that W6GAL, W3GRF, W4QV and W4BRB can't help you out with YA6GAL, 4W1AR, HJ8EW and PX1AA-4W1AB, respectively. . . . Reference the QSL-VP7NX-via-W8RVM squib in our May effort, ex-W8RVM (now W4FIQ) points out that this is true only for about 300 QSOs dating between July, 1953, through January, '54. For obscure purposes of bookkeeping long incomprehensible to Jeeves, certain licensing authorities deem it necessary to issue almost immediately a given call sign to successively different holders. In view of the importance of amateur radio's QSL tradition it should be obvious that such switching of call signs easily makes for confusion and the possible besmirching of innocent reputations. Two years doesn't seem an unreasonable length of time for a second-hand call sign to lie in abeyance while time dissociates it from the identity of its last previous owner. . . . W4QCW recommends that those still sly ZC7DO pasteboards reapply to G4CP. . . .

Stamped self-addressed envelopes are required if you accept the offers of W4ML and W5BNO to assist with FY7YE and VQ6LQ QSL matters, respectively. W5BNO's VQ6LQ logs date no earlier than May 1st of this year. . . . W6OUN earns a vote of thanks for turning out QSL stock for HK0AL, VQ6LQ, ZD6BX, YN4CB and others. Bill's homemade photo-process products are expediting rare confirmations for hundreds. . . . W6SYG, handling current QSL matters for VR6AC, will use bureau paths unless applications are accompanied by s.s.a. envelopes. . . . IIBNU of Trieste advises that the last published listing of Trieste *Call Book* addresses should be consulted while Italian licensing revisions are being completed. Likewise, then, for stations in Sardinia and Italy proper. . . . From HZ1AB: "Our QSL situation has been alleviated by the use of one of the Mimeograph machines on the base. . . . We are all caught up now and are QSLing exclusively through the bureaus. As soon as things slow down a bit, cards will be sent direct." Incidentally, HZ1AB makes use of U. S. postage. Operator W6CRV awaits reassignment and probably will draw a post in Europe. . . . For scaring up the following individual items, all hail W1s OIG OJR RDV TYQ UED VG WAI WPO WPR WY ZDP, W2BVS, W3WPG, W4s TFB YZC, W5FXN, W6s NJU UED ZZ, K6DVB, W8KAK, W9CFT, W9s CPM VFM, DL4ZC, KL7BBV, ZD6BX, NCDXC, NNRC, SCDXC and WGDXC:

## Whence:

Asia—AC5SQ puts virgin ARRL DXCC Countries List territory on the air after a move of 70 miles from his AC3SQ shack. This from VS1CZ via W6YY—how rare can a guy get? . . . . Further Asia gleanings courtesy W6YY: The first few weeks of BV1US (Formosa) activity produced over a thousand contacts with 50 countries. . . . A handy marker station for 20-meter breakthroughs to Asia is Hong Kong Cable & Wireless on 14.283 kc.; a female voice usually modulates. . . . VS2DQ, long a reliable source of Far East info, isn't expected back from Europe till next year. . . . Reminder: KAs must turn down 3rd-party traffic as of early June. . . . From W1s BDI RGY and others we're glad to hear that ex-AC4RF finally pierced the bamboo curtain. Bob had been imprisoned by Chinese Reds since the fall of Tibet in 1950. . . . W1UED advises that would-be Ham Vajapeyam Shankar Marayan Sri Nrusimha Vivas, No. D.84/839, 3rd Crossroad, Srirampuram, Bangalore 3, South India, desires correspondence with U. S. amateurs. . . . JA1ATF, probably the dean of Japanese amateurs, operated under prewar call signs J2PS, J7CG, MX3II and AC4TF. . . . Those seeking more DX-award wallpaper should write JA1UY with reference to a certificate offered by the Sugimani Radio Club of Tokyo. So advises K6DV via W1QON. . . . W6CRV of HZ1AB says incoming s.s.b. signals cut 20-meter QRM like a hot knife through butter but he has difficulty getting the local talent to tune for it properly. . . . In an interview with WGDXC newshawks VS2DW reports that a DX-station operator's pet dreams are WAS and a 60-QSOs-per-hour Test average. [How about an automatic QSL machine, Boss? A gadget that checks the log, prints the cards, makes them out, stamps them (free), signs them and mails them via rocket express!—Jeeves.] VS21DW keeps in touch with his 14-Mc. public by way of a modified BC-610E, HRO-M and dipole.

Africa—"I wish to inform you that I am going to Basutoland during August this year. I will be operating on 7 and 14 Mc. from about the 8th to 29th under the call sign ZS1P1/ZS8. I tried very hard to get a ZS8 call but was refused. The operating times will be approximately as follows: 7 Mc. from 2200 to 0600 GMT with a two- or three-hour break for sleep; 14 Mc. from 0800 to 1930 GMT. I will operate c.w. only, using 50 watts to 807s with ground-

plane antennas on both bands." This from ZS1PD who has accumulated some 103 countries at his Strand home station . . . . . ZD6BX reports that ZD6RM (GM3EAK) is helping to pass out Nyassaland QSOs with a will. "ZD6EF also is going strong with an 813 and long-wire on 14 and 21 Mc. He has clamp-tube modulated 'phone. . . . I am toying with the idea of a trip to the Aldabra Islands but obstacles are terrific! I could manage two weeks' leave for the project and I have suitable gear but the big thing is getting there, I'll do my best!" Vic closes in on the 100-confirmed mark and reports good results feeding each of his ground-planes with two sections of paralleled 75-ohm coax . . . . . ZS6VA is receiving QSLs from some unfortunate individuals who worked an n.g. ZS6VA out KH6-W6 way. —ZS1IR . . . . . WGDXC Africanograms: SV0WK departed from Greece to try ham conditions in Egypt. . . . EL2X visited Stateside and may become a W2 or K2. . . . CN8MM mentions the activity of FB8AM on Amsterdam Isle. . . . VQ5FS expects to be active in Uganda for several years and has a sharp collinear array focused on his native Eire (one way to minimize W/K interference!).

**Oceania** — W6YY's voluminous Oceanic notes make interesting excerpt: ZC2PJ writes, "Regret I'm only transient here. Returning to Ceylon in August. Hope to see you from 487 [with my 75-watt 807s rig]. Hope my relief here will take a rig so that ZC2 is still on the air. Haven't heard any ZC3s in a long time." . . . VR6AC, located on the northeast coast of Pitcairn with a 1000-foot mountain reflector behind him, expects to be active several times weekly for North American contacts. When not on the air he charges his batteries anew. . . . VS1CT closed down VS5CT in late May after 912 Brunei QSOs that included contacts with 28 states. After a few Sarawak months he'll probably return to Brunei or try his hand at ZC5 work. . . . The freshly available WIA (Australia) WAWKCA award is based on obtaining 21 QSLs, these to include one from any VK1, one from any VK9, one from Northern Territory (VK5 prefix), and three each from VK2 VK3 VK4 VK5 (South Australia), VK6 and VK7. Write WIA at Box 2611W, CPO, Melbourne C1, for full details before applying. Finding one of those Northern Territory VK5s should keep you busy for awhile! . . . Norfolk's VK9RH usually lists his DX on week ends from 0400 to 0600 GMT, 40 and 20 . . . . In the 1954 VK/ZL Test ZL1AH and VK2GV copied c.w. holders; ZL1MQ and VK2AHH cleaned up on 'phone. Peak scorers for their respective U. S. call areas were Ws IRWP 2WZ 3VKD 4KXV 5HVR 6MVQ 7PQE SJIN 9ABA and 6RSL. W6YY topped the North American field on voice. The 1955 VK/ZL affair is coming fast upon us, incidentally, October's the month! . . . .

W7HNG, we learn from W1WPO, was VR6AC's first A3 QSO since prewar days. VR6s AW and AY, though still on the island, remain inactive hamwise. VR6AC had difficulties in getting out until he tried W6MUR's suggestion and cut off some flat-top. . . . Ham and tropical paradise at KC6AA of Yap Isle: Viking I, SX-88, HQ-140X, 75A-3, and two long-wires 90 feet high, one of which is 1200 feet long and traverses a lagoon overlooked by the shack . . . . VK31B, ex-VK1AC, toils at Victoria b.c. station 3SH when not working on his Macquarie QSL backlog . . . . VR2BZ retired from RNZAF duties and no longer traipses over to the Tokelau area.

**Europe** — EDR (Denmark) has modified its OZ-CCA award rules so that amateurs outside Scandinavia won't find it such an impossible nut to crack. Write the society's Traffic Department, Diploma Section, P.O. Box 335, Aalborg, for the revised specs . . . . Early this month HB1s IV and MO (c.w.) and HB1GW ('phone) will fire up on 5000-foot Mt. Rigi, Schwyz canton, on 80, 40, 20, 15 and 2 meters. "We would be glad to meet many American stations and will listen and call each evening beginning 2100 GMT." Their climb is sponsored by the Lucerne section of USKA . . . . Attention is called to the Swiss S.W. Service's amateur DX programs broadcast by beam to North America on 6165, 9535 and 11,865 kc. each first Friday (Thursday night in U. S. A.) of every month at 0150 and 0435 GMT. HB9s CZ GI and HE9RDX are emcees . . . . Dates specified last month for the DARC (Germany) WAEDC contest are valid. This world-wide DX test is the postwar version of the old DJDC affairs and should be a real whingding. Make plans now to be around the shack from 0000 to 2400 GMT September 17th-18th (c.w.) and 24th-25th ('phone) — details next month. The

A stream of W/K/VE/VO contacts and a good share of rarer DX entities keeps coming back to CR7DK's Bandmaster. The Hallcrafters receiver sorts out the many customers who queue up on several bands for Fernand's Mozambique confirmations.

shrewd heads will get up fixed arrays for Europe because a 3-element beam will be just another antenna in this competition! . . . . From 11CWZ: "There now are very few hams in Italy because of the new regulations issued last year. All Italian hams have had to sit for examinations on theory and c.w. in order to get their old ham licenses renewed. So far the number of new licenses is around 200; before the regulations changes there were 4000 hams in Italy." Mario intersperses his own DX work on 80 through 10 meters with frequent 2-meter sorties and has a neat low-power 91/80 DX record . . . . Via KN2KHZ: OH1s RX SS and others put the Aaland Islands on the air in late May with a 200-watt 813 on 3.5 and 14 Mc, using ground-plane and Vee antennas. U. S. contacts numbered 70 out of a 274-QSO total, all contacts save one being on c.w. The Aalands make up the rarest of Finland's ten departments (states) so their QSLs will be welcomed additions to many collections . . . . SRAL (Finland) seeks inspiration along the line of a receiver for their hq. station. Those with pregnant ideas can drop OH2RY lines . . . . G3JFD, via NNRC's *Official Bulletin*, clarifies British call-sign arrangements. "Firstly, no distinction is made between the various prefixes of the British Isles (G GC GD GI GM GW), which means that if there is a G3AAA, no other British prefix can be followed by "3AAA" unless G3AAA moves to another area. Secondly, the numbers in British call signs have no territorial significance whatever." G1 G7 and G9 calls are special used by experimental stations of various kinds. The GB prefix is reserved for use by exhibition stations and the like. Only the prefixes G2 and G3 at present are followed by three letters, these being call signs issued since 1945.

**South America** — From South Shetlander VP8A: "There will only be four VP8 stations active from Antarctica this coming year. They are VP8BI who will be operating from Grahamland, VP8s AQ BF and BH who will be operating from the South Shetlands. There is a faint possibility that a VP8 will be active from my old location in South Orkney Islands but the call is not known at the moment. The VP8 stations who were active from Antarctica during 1954 — VP8s AA AO AX and AZ — already have, or will have in the near future, returned to England."

. . . . . W2BVS finds that CX7CO tunes the U. S. Novice

(Continued on page 126)

"There he is. . . . No, it's someone calling him. . . . What a pile-up! . . . Wait — he's coming back — got him!" CX2CF is shown here participating in the rapidly reviving sport of 10-meter DX chasing. Peter has a 4-250 final modulated by Class AB<sub>1</sub> 4-125s, and receives with an RME-45.

**A Test for Handling Overseas Traffic.** Regulations prohibit the handling of communications on behalf of third parties *internationally* by amateur radio, except where special arrangements have been made between nations. Chapter 9 of the ARRL *License Manual* details this prohibition (Article 42 of the Atlantic City documents). Our operating booklet likewise mentions the restriction in the section on handling messages. Third-party traffic under certain treaty provisions and limitations is authorized between the United States and Canada, Chile, Cuba, Ecuador, Liberia and Peru. Traffic may be freely handled with outlying U. S. territories and possessions wherever amateurs are licensed by the FCC, as well as with the Canal Zone. *Message traffic for U. S. military personnel overseas is permitted only with amateur stations identified by properly authorized call signs having a one or two letter prefix beginning with a W or K.*

Traffic of an unofficial nature that comes via MARS or on a military instead of an amateur frequency is sometimes re-originated or re-filed for handling within the U. S. A. as an amateur radiogram. Since Germany has been returned to the ranks of sovereign nations Article 42 is again applicable and traffic on amateur bands may *not* be handled directly with DLs, though such MARS re-files are perfectly legitimate. The form or procedure for such re-files is detailed on page 130, June 1953 *QST*.

**Limitations Requested on Japanese Traffic.** The Far East Auxiliary Radio League is the organization of the KAs in Japan. Pointing out that their request does not concern MARS programs or amateur operation in other than their region, the FEARL has requested KAs and those they work voluntarily to limit third-party traffic to personal problems such as arrival and departure messages, family illness, deaths, assisting dependents getting ready to go overseas, etc., and to carry out a reduction in third-party traffic of all kinds. The removal of any essential traffic in KA-land from their amateur 'phone bands to either MARS (military) frequencies or c.w. transmission and limitation of all 'phone patches to cases of actual need is urged by the FEARL. Important matters of finance or personal business they point out should be filed by commercial service both to give privacy and assured guaranteed delivery. It is also requested that any unnecessary greeting, etc., messages that unduly expand the volume of work be curtailed. From the data released by FEARL it appears that quite probably in view of Japan's resumption of licens-

ing (sovereignty) the JARL and commercials operating under Japanese license have objected to the essential character of some of the communications, doubtless in the light of the conflict with treaty provisions (Art. 42) as above mentioned.

**P.A.R.E.C.** The letters stand for Portable Amateur Radio Equipment Contest and recall to mind the famous Miles Per Watt contest of the Twenties. (u8GZ using '01A's and 199's won the Jewell Contest; on 40 meters in Jan. and Feb. '26 he worked oa6N and oz2XA with inputs of 1/2 watt, something to try on VKs today!) The Field Day challenges our ability to "make under 30 watts count" but stand-by radio provisions for civil defense are far from fulfilled in the light weight, low-power equipment categories. The need for amateur hand-carried and mobile equipment, packaged for results with minimum weight, is therefore a measured objective in its own right by anybody's say so. So here's the background on how you can submit some equipment descriptions to a specialist group offering you certificates for your accomplishment in this constructional field.

To increase interest in, and encourage development of Low Power and portable equipment by radio amateurs, the *QRP Society*, an RSGB group, is running a constructional competition not to close until September 30, 1955 known as their Portable Amateur Radio Equipment Contest. This is open to all licensed amateurs and SWLs throughout the world either as individuals or in club teams. Any number of entries may be submitted, though the equipment itself is not to be shipped overseas. The *QRP Society* will give certificates for overseas entry descriptions adjudged best with its contest divided into four equipment-classes.

**Class A** — For hand carried portable receivers (up to 3 pounds), transmitters up to 5 pounds and transceivers up to 7 pounds. Must be dry battery operated, weights exclusive of batteries, phones, key, antenna. Economy of battery consumption, lightness, compactness, versatility and ease of operation will be considered.

**Class B** — For mobile transmitters, receivers or transceivers up to 10 pounds maximum weight, exclusive of batteries but *inclusive* of vibrator unit as necessary.

**Class C** — For transistor sets up to 2 pounds weight exclusive of auxiliary equipment.

**Class D** — For portable *test gear* of any type such as wave-meters, signal generators, etc. All must be amateur built, battery operated and truly portable.

A special certificate will be issued by the *QRP Society* to the *best three* American entries in each class. Submit entries before September 30, 1955 to J. Whitehead (Hon. Secy. *QRP Society*), 92

Rydens Avenue, Walton-on-Thames, Surrey, England. On page one of your entry give name, call and address of sender and name the equipment described. On page two give circuit diagram and components list. Show on page three layout sketches and photographs and on further pages give a detailed description of the gear, covering theoretical, constructional and operating aspects. Drop ARRL a QSL telling us the equipment you are reporting to the QRP Society, or an extra carbon if you can spare it. We're interested.

**DX Club Sets High Operating Standards.** The "Southern California DXER Award" is to be an engraved plaque, presented annually "for outstanding performance and meritorious achievement in amateur radio DX work among Southern California amateur radio operators." W6MUR explains that the first presentation by the Southern California DX Club will be at the joint DX clubs' meeting in Fresno in January, 1956. Nominations will be received by the club in the period November 1st to December 15th. The club stresses that the Southern California amateur who is the winning candidate does not necessarily have to be a member of the club. A club committee will be charged with weighing some of the following factors in making a choice for the plaque award. In the following, readers we think, will approve of the importance SCDXC has given in its listings of factors to the promotion of DX success in terms of positive operating courtesy and ability, with initiative in club work as well as in operating. The last item (k) spells out that the man with most power and ruthlessness does *not* necessarily win! The group considering the nominations and results for the year 1955 according to this may consider DX results obtained contrasted to the capabilities of the station. *How well an amateur performs with what he has*, if given an appropriate weighing by the award group, could give a Southern California amateur in the lower power category a chance at this one! Here are the items for objective rating of all possible candidates:

- (a) Operating ethics and courtesy.
- (b) Station quality.
- (c) Signal quality.
- (d) Observance of FCC regulations.
- (e) Contributions to Southern California DX: participation in club activities, contests and functions; attendance at club meetings; bulletin contributions, technical contributions and similar factors.
- (f) Contributions to amateur radio: helping new amateurs, or foreign amateurs in any way through expedition traffic, loans or gifts of parts or equipment, handling or supplying QSL cards, assistance with technical problems, etc.
- (g) Attitude toward fellow amateurs.
- (h) Attitude toward the public, including neighbors.
- (i) Perseverance; effort in listening for new countries; in obtaining missing QSL cards; in striving for DX goals of various sorts such as certificates or awards; in ferreting DX information.
- (j) Operating ability: copying through noise or QRM; code speed; ability to cope with confusion, etc.
- (k) Success, expressed as a qualitative ratio of DX worked to capabilities of station—how well an amateur performs with what he has.
- (l) (m) Other factors considered applicable.

—F. E. H.

## WIAW OPERATING NOTE

A slight change has been made in the WIAW General-Contact schedule effective June 1st (see page 70, May QST). The station will no longer listen for Novices after the midnight (EDST) bulletins on 3555 kc. Tuesday and 7125 kc. Friday. Instead, WIAW will listen for Novices after the midnight (EDST) bulletins on 3555 kc. Wednesday and 7125 kc. Saturday (A.M.). The lithographed WIAW schedule now available on request shows this change.

The WIAW operating schedule (page 74, July QST) is still in effect.

## BRIEF

In the Novice Round-up Results (May QST), the call of the Santa Clara Valley leader should have been shown as KN6EMO. In addition, information brought to our attention reveals that KN2IBH, not KN2ICU, was the rightful winner in N.Y.C.-L.I. section.

## BRASS POUNDERS LEAGUE

Winners of BPL certificates for May traffic:

Call	Orig.	Recd.	Rel.	Del.	Total
W3WTQ	55	1271	1350	81	2757
W7BA	15	780	753	26	1574

K5FEF	166	KR6KS	130
-------	-----	-------	-----

BPL medallions (see Aug. 1954 QST, p. 64) have been awarded to the following amateurs since last month's listing: W4DRD

The BPL is open to all amateurs in the United States, Canada, Cuba, and U. S. possessions who report to their SCM a message total of 500 or more, or 100 or more originations-plus-deliveries for any calendar month. All messages must be handled on amateur frequencies, within 48 hours of receipt, in standard ARRL form.

## APRIL 30TH RACES TEST

We use the above title with reservations. There seems to have been some question as to whether this was a RACES test or an "Amateur Test of RACES Potential." The latter is probably a better description of it, but it's too long for a title. Actually, the test included AREC organizations in all stages of RACES preparation as well as those already RACES-authorized in FCDA Region I.

A bit of background will be pertinent. As long ago as last October, FCDA by official letter requested ARRL to assist in conducting a test of RACES facilities and potential in one of its regions, to serve as a monitor or "sounding board," if you will, for the nationwide Operation Alert test to be conducted in June. Naturally, we agreed to do so and alerted our ECs in Region I by special bulletin. A preliminary meeting was held in West Hartford in early February to discuss plans with representatives of FCDA and others. In late March, a meeting of all state e.d. radio officers and all ARRL SECs in the region was held in New York to finalize plans. It was at this meeting that the decision was made to include all amateurs working in civil defense, whether they were finally authorized for RACES or not. Only in this way would an accurate idea of RACES *potential* be obtained.

As it turned out, not all RACES authorized groups participated — or if they did, they didn't tell us about it. We ran two surveys, one before the test on the basis of those who expected to participate, and one after the test on the basis of those who actually did so. Let's compare them briefly.

A total of 122 ECs made preliminary reports on their potential for the April 30th Test. Of these, only 48 reported actual results; however, 49 *additional* ECs, who did not make preliminary reports, also reported results, making a total of 97 ECs who *did* report results. Compared to the 122 preliminary, this is a mighty good percentage. To be statistically accurate, however, the percentage of participants compared to the number who expected to participate was 39.3%.

A comparison of expected with actual participation can best be summarized in the following table:

Item	Expected	Actual
Fixed Control Stations	664	216
AREC members participating	1319	671
Total operators participating	2019	873
Mobiles (total)	802	233
on 75 80 meters	42	11
on 10 meters	440	144
on 6 meters	20	18
on 2 meters	301	79
Hand-carried portables	141	22

No comment is needed on the above data. They speak for themselves. Naturally, they reflect only reports received. We have no notion of how many groups who said they intended to participate actually did so but didn't report it — or how many expected to and did take part but didn't report either time. These are just some of the imponderables about this business.

A brief rundown on statistical results of the April 30th Test and we'll be done with them. There were 671 AREC registrants participating, 89 non-amateur operators and 113 non-AREC amateurs assisting. Stations used consisted of 216 fixed control stations, 236 other fixed stations and 233 mobiles. Most of the mobiles (62%) operated on ten meters, with two meters, six meters and 75 meters following in that order. Forty-three ECs reported that CD officials were present at the test, 36 that they were not; the rest did not say. Twenty-five ECs rated non-RACES CD cooperation as excellent, fifteen as good, seven as fair, five as poor, two as "lousy" and fourteen said cooperation was non-existent.

Eastern Massachusetts section ECs contributed the greatest number of reports on the test (18), with Connecticut second (12), Eastern New York third (11) and Western New York fourth (10). Western New York had the greatest number of participating operators (192), with Eastern New York second (159) and New York City-Long Island third (132). In mobiles, Western New York was high with 65, New York City-Long Island second with 41, and Eastern New York third with 32.

The test started at 1530 and lasted until 2130 EST, in order to get the best possible cross-section of band conditions during daylight, twilight and total darkness. Many of

the participating groups kept active the whole period, changing "shifts" every two hours in order to get a better picture of operating requirements in the real thing. Circuits were kept heavily loaded with "canned" messages in order closely to simulate actual emergency operating conditions.

FCDA sent Jim MacGregor, WSDUA, into Region I to observe the test first hand. Jim visited the New York State control center in New York City, then in the company of New York State RACES Radio Officer W2BGO, he journeyed into Connecticut for a visit to Connecticut installations and ARRL Headquarters.

Our count of ECs in FCDA Region I is 440. Ninety-seven reporting results is 22%. This is about what can be expected — in fact, it's better than most of our previous reporting records; which isn't the same as saying it is *good*.

The record does not do justice to the performance of the Rhode Island gang, as reported by SEC W1TQW. Twenty recently-appointed ECs activated communications networks in 16 major cities and towns throughout the state, with 200 amateurs responding to the call — about one third of all the amateurs in the state. Each of the 16 nets, consisting of a control station controlling a mobile net, maintained contact with a two-meter substation operating at state level. Traffic originated in any locality would be picked up by a mobile, transmitted to his control, passed to the state station and relayed into state headquarters in jig time. A total of 307 messages were routed to state control in Situate by this method.

Termed a success in glowing phrases in Rhode Island, the April 30th Test was described less enthusiastically in other states in the region. The statistics show that a good showing was made in New York, as was to be expected of a well-organized state RACES establishment. Statistics fail to do justice, however, to the showing in Northern New Jersey, which was better than indicated. Connecticut maintained its standard as a pace-setter for RACES organization, although there was some misunderstanding concerning eligibility to participate which kept attendance down. This same misunderstanding occurred in Massachusetts, another well-organized state from the e.d. angle. The remaining states participated at about the expected level.

It is easy enough to be mealy-mouthed and say the test was an "overall success." Actually, whether or not it was so is a matter of individual opinion — and we have heard opinions variously from "complete flop" to "indeed a successful demonstration." Looking at it from an overall viewpoint, which probably we at headquarters are better qualified to do than most others, the test appeared to have only partially served its purpose, which was to indicate amateur radio civil defense potential. We think the potential is considerably greater than shown by test results received here.

Under the heading of "Wouldn't It Be Nice If . . ." most of our emergency net organizers and net controls would list ". . . we had clear channels for our emergency nets." We agree — it *would* be nice, and if we are going to dream, that's a good enough thing to dream about. But alas, comes the awakening and we have to face the fact that we do *not* have clear channels, and only in the direst emergency can we expect to have anything approaching them. It is common practice among many nets to request casual stations to QSY when they cause QRN to a net drill, simulated emergency test or any other AREC or RACES activity. Some of them move gladly (often only to run into another net), some reluctantly with mutterings or sarcasm, and a few stand on their rights and downright refuse to budge. All who are asked to move, even those few who might agree that what you are doing is more important than what they are doing, experience at least a slight twinge of irritation.

The average amateur will, when he realizes that he is interfering in a net drill, move off of his own accord, or QRT until the drill is over, *without* being asked. Those who do not do so are usually the type who would not do so

◆ This is the communications section of the Glencoe Mutual Aid Area auxiliary control center at Strathburn, Ont. VE3WY is Coördinator for civil defense in this area, and sent us the picture, which he has plainly labeled. Note that No. 1 position operates on 3502 kc. c.w., No. 2 on 3675 kc. phone and No. 3 on 3535 kc. c.w. Actually, the latter two are "receive only" positions, while the Viking at No. 1 transmits on any one of the three frequencies.

◆ even after being asked, and the only result of asking them will be creation of hard feelings, or exchange of harsh words over the air. So what have you gained?

The solution? There is none, really. Our amateur bands are crowded, and we should be glad they are, because if they were not we probably wouldn't keep them intact very long. Such being the case, we have to make the best of a situation in which not all amateurs are consciously dedicated to public service, and grin and bear it — and think of how much practice we are getting trying to copy traffic or emergency dispatches under adverse conditions.

◆ On February 25th, ice and water seepage broke an underground cable in La Crosse, Wisc., severing communications with CAA's French Island facility. W9OGT, a communicator working for CAA, went into action from his mobile, contacting W9GPU in La Crosse. W9GPU contacted W9OOL in Madison, who served as a delivery point for hourly weather sequence reports to USWB officials in Madison until the cable was repaired. North Central Airlines also benefited from this operation. As a result of this service, W9AZN, representing CAA, presented the two amateurs with certificates of appreciation.

◆ On May 6th, 1819 CST, tornadic winds, rain and hail hit Temple, Texas, wreaking much destruction and knocking out power. Members of the Temple Amateur Radio Club were alerted and assembled at the Police Station on a standby basis. Shortly thereafter, in answer to a call, the amateurs furnished a power generator for flood lamps at the scene of the major damage. This power unit was taken out of service at 2200 when the National Guard arrived with other power units. Communications were furnished from the scene of the disaster by W5PNP/m and W5VLF/m through fixed station W5CHF. Stations participating were W5s VLF SBS CHF JIB WDW WMX PNP UPO VHF/m DXD RDL DSG and TVA. This information furnished by W5VLF through W5VHF, EC from Waco who followed the storm into Temple.

— W5RRM, SEC Northern Texas

◆ On May 14th, while driving about 30 miles from Houston, W5GLS suddenly became ill. He contacted W5GVW/m on 75-meter mobile, and had them call his doctor, who advised W5GLS to get to any hospital as soon as possible. When GLS indicated the hospital he was headed for, the doctor called this hospital and made all arrangements. W5GVW/m also made arrangements for a police escort. The doctor stated that if GLS had not gotten to the hospital, he would have died. W5GVW, assisted by W5GWP, handled this emergency traffic like an old timer. — W5FEK

◆ A plane crash in Northboro, Mass., alerted the Worcester AREC group on May 26th. EC W1SPF started the ball rolling by firing up on ten meters as soon as he heard about the crash and calling W1UQW, who was talking with W1YPK in Holden. In less than two hours, nine other stations had reported in, completely without warning or notification of any kind, showing how frequently members of the Worcester AREC-RACES group guard their emergency net frequency. W1ZMM/m went to the fire depart-

ment at Northboro and was told an ambulance had already been sent to the scene of the crash. W1MHA was asked by the Marlboro Airport to locate the plane and get the name of the party or parties involved in the crash. W1ZMM/m and W1JWM/m proceeded to the scene of the crash, but police withheld the name of the crash victim, who was killed. The plane number was reported, however, to the Marlboro authorities by amateur radio. W1LQW handled the net activity and everybody cooperated 100 per cent. Others who participated include W1s EBU RCJ MEG MT BIA and PMZ. — W1SPF, EC Worcester, Mass.

◆ The Purgatoire River in Colorado went on a rampage on May 26th and gave the little town of Trinidad, Colo., a pretty hard time. Amateurs from throughout the area figured prominently in the communications work. W6NVU took the brunt of the load in Trinidad itself, with amateurs from all over the state and adjoining states helping out with the traffic, most of it welfare. Bob worked for 40 hours without a break. He was assisted by the Hi Noon Net and other stations from the general area in handling over 300 emergency messages into and out of the flooded district. K0WBB, with Mac operating from Fort Carson, was also very active in this work. Mac later took a mobile unit to Trinidad, leaving K0WBB operation to two other operators, Milt Moore and Dave Morset. Others known to have been assisting were W0s SUP PGX KQD ICR PGN K0ANZ W7SP1/0 Quentin Fuller, Tommy Clark.

◆ A missing person search at Amos, Quebec, required the assistance of amateurs in that area. The Molson Emergency Unit (a deluxe emergency trailer unit sponsored by Molson's Brewery) traveled from Montreal to Amos to participate in the search, but had to leave without its regular operator, VE2MW. Siscoe EC VE2FL contacted the driver as the unit was passing through town and offered assistance. Then he called Assistant EC VE2ADD at Amos, who agreed to alert local amateurs to assist in the search. Thus, when the unit arrived at Amos it was provided with a radio operator in the person of VE2AHV, who went with it to search headquarters, 20 miles northeast.

◆ The station in the unit went on the air at 1430 EST and was operated almost continuously by VE2AHV and VE2ADD (who arrived later) until 2330. VE2ADA was also on hand to help operate hand-carried units with the mobile unit. The search continued on June 8th and June 9th, with the following amateurs taking part in the action: VE2s AOF AVH ADI AEV OB HL AHU FL and VE3TX. The search was abandoned on June 10th at 2300.

— VE2FL, EC Siscoe, Que.

◆ Fourteen SECs reported April activities on behalf of 5228 AREC members. This includes a report from the North Texas SEC which was in written nonstatistical form. It also includes reports from old stand-bys in the following sections: Minn., Wash., Tenn., Western N. Y., N. Y. C.-L. I., Georgia, E. Fla., Ala., San Joaquin Valley, Wisc., S. Dak., Los Angeles and Oregon. Twenty-three SECs have now submitted reports in 1955. The April reporting record is equal to that of a year ago in number of reports, far exceeding it in AREC members represented.

## A.R.R.L. ACTIVITIES CALENDAR

Aug. 5th: CP Qualifying Run — W6OWP  
 Aug. 16th: CP Qualifying Run — W1AW  
 Sept. 3rd: CP Qualifying Run — W6OWP  
 Sept. 14th: CP Qualifying Run — W1AW  
 Sept. 15th: Frequency Measuring Test  
 Sept. 17th-18th: V.H.F. QSO Party  
 Oct. 7th: CP Qualifying Run — W6OWP  
 Oct. 8th-9th: Simulated Emergency Test  
 Oct. 13th: CP Qualifying Run — W1AW  
 Oct. 15th-16th: CD QSO Party (c.w.)  
 Oct. 22nd-23rd: CD QSO Party (phone)  
 Nov. 5th: CP Qualifying Run — W6OWP  
 Nov. 12th-13th, 19th-20th: Sweepstakes  
 Nov. 18th: CP Qualifying Run — W1AW  
 Dec. 2nd: CP Qualifying Run — W6OWP  
 Dec. 12th: CP Qualifying Run — W1AW

## RACES News

Operation Alert, 1955, has come and gone. RACES was active — more so, we dare say, than most branches of civil defense in most parts of the nation, generally speaking. Reports from participants are beginning to reach us. There will be a QST write-up on the amateurs' participation in this nationwide exercise, in September QST if we can make it. Its location in the magazine will of course depend on the material available. So send us photos if you want to make it "up front" material; otherwise it may be relegated to six point.

Recent conversations with people at Battle Creek (FCDA National Hq.) bring out numerous facts and opinions concerning the test, mostly a result of monitoring. One of the most glaring deficiencies noted from that level was the improper use of frequencies and technique, according to a pre-copy telephone conversation. The feeling is that not enough advantage is being taken of the use of c.w. for medium- and long-haul traffic in most areas. Instead, attempts (often futile, almost always frustrating) are being made to handle all this traffic on 75-meter 'phone.

The above comments are not ours; they come unsolicited from FCDA Headquarters, where monitoring indicated too much use of 75 'phone, not enough use of 80 c.w. for RACES operations during the drill. Also, no action was heard on the DCS frequencies of 1750-1800 kc., and only one network was observed operating in the 160-meter RACES segments. One station was heard using c.w. on 3993 kc., trying to cut through the QRX.

All things are relative, however. We are better off thinking our performance, generally speaking, was below standard (that is, below the standard we would like) than resting on our laurels, such as they are. Actually, the nation-wide RACES establishment compares most favorably with any other branch of civil defense in its participation in this test. In the few local control centers we visited, RACES facilities operated longer and harder than any other c.d. facility. Publicity was favorable. We made a good showing; but it could be a lot better. Next year it shall be.

South Dakota amateurs are getting after their state officials to start something along RACES lines. At a meeting in Mitchell on April 17th, W0GCP called the meeting to order and speakers included W0GCP (the SEC), W0RRN (the SCM) and several other ARRL and state officials. The governor has been contacted and has expressed himself in favor of organizing the amateurs for c.d. The group at Mitchell recommended the appointment of Myron Jones, W0QXC, as state radio officer. The meeting continued to discuss detailed plans for statewide organization under the AREC and RACES. Keep your eye on South Dakota.

In New York State, W2BGO reports that the RACES organization is assisting the Radiac (radiological monitoring) branch of civil defense by transmitting c.d. fallout weather reports twice a day except week-ends and holidays. They are received from the Weather Bureau in New York City by radioteletype and put on the air at 1600 and 1700. Radiological chiefs throughout the state have the radiac

people receive these reports, break them down and plot the winds aloft. It's good training in communication, meteorology and coordination combined.

Another state to keep your eye on is Kentucky. SEC W4CDA reports having attended a meeting on April 8th in which a great many state c.d. officials were included, including W4BAZ (Communications Director of 3rd Mobile Support Group) and W4MGT (Communications Director of state OCD). At this meeting, the discussion centered around establishing c.d. communications to the amateurs in a RACES network. It was decided that the state OCD will endeavor to get funds for equipment to establish such a network.

## TRAFFIC TOPICS

Every traffic net is an emergency net, and every emergency net is a traffic net. This is, or should be, axiomatic in our public service establishment among amateurs. It is something which we have urged many times, and it bears repeating.

Each of us has at one time seen an emergency net in which members seem to have no conception of how to handle traffic; and most of us have also seen traffic nets which not only have no plans for but disband operating in an emergency. Each group has something to learn from the other. Traffic handling and emergency preparedness are not dissociated subjects. For a traffic net which cannot effectively operate under emergency conditions is not much of a traffic net, and an emergency set-up which cannot effectively handle traffic will be an awful flop in an emergency.

Enough said? No, not quite. This is a traffic column, and we are here concerned principally with traffic nets. It seems to us that there are an awful lot of them in operation these days which have no plans to operate in an emergency. How about in your section? Do plans exist to activate your net, on its regular operating frequency, to handle both official and individual welfare messages at a moment's notice? If no, why not get together with your SEC to put such plans into effect?

As for the National Traffic System, plans for activating these nets for emergencies have existed right along. They were first promulgated in an Emergency and Traffic Bulletin dated "Spring, 1950." We think they will now bear repeating.

When an emergency situation arises, regardless of the time of day or night, the NTS net or nets in the affected area should be activated and ready to handle any and all emergency traffic, while NTS nets in surrounding areas should be activated to take care of outside communications if and when called upon. Depending upon the urgency involved and the volume of emergency traffic, official or otherwise, the net manager concerned has the duty of determining whether his net in any particular situation shall handle official emergency traffic only, all emergency traffic, or all traffic as usual. His decision should be complied with by all traffic handlers concerned.

The extent of NTS activation in emergencies depends entirely on the extent of the emergency. If a local flood, the section traffic net will probably be sufficient. If covering an area of several states, probably the regional net should be activated in addition to section nets, with "shuttle" liaison between them, and possible activation of the area circuit to provide outside contact. If the emergency is area-wide, all NTS nets within that area should be on the job, with possible activation of an adjacent area net to provide outside contact.

The above is policy now with the National Traffic System. We think it should be an over-all policy of traffic nets to be worked into their section-wide emergency organization. In some cases this has already been done. In those where it has not, don't you traffic men wait for your SEC to act. Offer your services and those of whatever net you represent. As a traffic man, you can do a world of good in any emergency.

Two miscellaneous traffic net reports: (1) Early Bird Net traffic count for May was 613; (2) The First Call Area section of TCPN registered 749 messages, with 12 stations participating, during May. The Second Call Area section reported 571 messages with 9 stations.

From an anonymous contributor: "Heard the following on 75 'phone: 'Say OM, I am short five or six messages in my tally for making BPL this month. Can you think up any

old thing and send it to me and I will make a message out of it so I can add to the score.'

"What in the world has happened? Have the young squirts turned BPL into a SS contest?"

**National Traffic System.** Ament the prospect of reactivating the Mountain Area Net. W0KQD has compiled some statistics to show that it "ain't easy." The Mountain Area (i.e., generally speaking the area encompassed by the MST zone) has a population of less than one third that of the Pacific Area, about a tenth of the Central Area and a fifteenth of the Eastern Area. Amateur population is roughly comparable. There would also be the necessity for twelve additional TCC schedules per week. To reactivate a Mountain Area Net, W0KQD concludes, would require a great many more ardent NTSers than now appear to be extant, at least equivalent to those in the Eastern Area with its much larger population.

Do they exist? If not, can they be created? Colorado alone is contributing more personnel to TCC than any other single state. If the entire Pacific Area produced TCC operators at the same rate as Colorado, that Area would have 75 TCC operators, Central Area would have 177 operators, and Eastern Area would have 323 operators. But an area organization cannot rest on the shoulders of one section. How about some of the other Mountain Area states? If you want a separate Mountain Area organization, you'll have to produce the operators. It was for lack of operators that MAN had to be abandoned in the first place.

Several section net managers have asked why their nets cannot get more than summary mention in this column. The reason is that there simply isn't room, fellows. Your SCM's activities column is the place for mention of any details of section net operation. The mention below of regional and area nets is included here because these nets are not within section boundaries; if they were, undoubtedly they also would receive no space here. But section nets are a very vital part of NTS, make no mistake about it. We would like to have data each month on your schedule, number of sessions, traffic handled and list of NCSs.

**Net notes:** 1RN conducted a special session on Saturday, May 21st, to assist the Cranston, R. I., YMCA drive, at which amateur radio was a feature. The net was active from 1300 until after 2000 that day, handled 86 messages. A 3RN certificate has been issued to W3IYC. Heavy QRN is hampering operation of 4RN, but new manager W4BVE is showing progress. RN5 is handling more traffic than ever before in its history. Much of this is due to the efforts of old-time-traffic-man W5IGW, who is QNI almost every session and on May 21st NCSd the net for six hours, clearing 204 messages. RN6 expects to have a KH6 representative soon. Many sessions of SRN were not reported in May. TRN is now operating two sessions nightly, at

1845 and 1945 EST Monday through Friday, the early session on 7070 kc. and the late one on 3535 kc. TRN certificates have been issued to VE's 1OM 1HJ 2DR 2CP 3BUR 3AVS 3TM 3AJR and 3ACU.

TCC Area Directors are having a tough time keeping their rosters full during the summer. W8UPB reports for Eastern Area that eight TCC stations made 25 reports in May, with W1EMG passing the most traffic. W6HC reports for Pacific Area that nine TCC stations reported, with W0EKQ handling the greatest amount of traffic. Harry is also desirous of relinquishing his TCC job, now that he has taken over as ARRL Director. Any takers?

ELECTION NOTICE

(To all ARRL members residing in the Sections listed below.)

You are hereby notified that an election for Section Communications Manager is about to be held in your respective Section. This notice supersedes previous notices.

Nominating petitions are solicited. The signatures of five or more ARRL full members of the Section concerned, in good standing, are required on each petition. No member shall sign more than one petition.

Each candidate for Section Communications Manager must have been a licensed amateur for at least two years and similarly a full member of the League for at least one continuous year immediately prior to his nomination.

Petitions must be in West Hartford, Conn., on or before noon on the closing dates specified. In cases where no valid nominating petitions were received in response to previous notices, the closing dates are set ahead to the dates given herewith. The complete name, address, and station call of the candidate should be included with the petition. It is advisable that eight or ten full-member signatures be obtained, since on checking names against Headquarters files, a petition may be found invalid by reason of expiring memberships, individual signers uncertain or ignorant of their membership status, etc.

The following nomination form is suggested: (Signers will please add city and street addresses to facilitate checking membership.)

Communications Manager, ARRL. [place and date]  
38 La Salle Road, West Hartford, Conn.  
We, the undersigned full members of the .....  
..... ARRL Section of the .....  
Division, hereby nominate .....  
as candidate for Section Communications Manager for this  
Section for the next two-year term of office.

Elections will take place immediately after the closing dates specified for receipt of nominating petitions. The ballots mailed from Headquarters to full members will list in alphabetical sequence the names of all eligible candidates.

You are urged to take the initiative and file nominating petitions immediately. This is your opportunity to put the man of your choice in office.

— F. E. Handy, Communications Manager

Section	Closing Date	SCM	Present Term Ends
Yukon *	Aug. 15, 1955	W. R. Williamson	Mar. 17, 1949
West Indies	Aug. 15, 1955	William Werner	Aug. 15, 1952
Utah	Aug. 15, 1955	Floyd L. Hinshaw	Feb. 18, 1954
Colorado	Aug. 15, 1955	Karl Brueggeman	Feb. 16, 1955
Vermont	Aug. 15, 1955	Robert L. Scott	Oct. 15, 1955
South Carolina	Aug. 15, 1955	T. Hunter Wood	Oct. 15, 1955
San Diego	Aug. 15, 1955	Don Stansifer	Oct. 15, 1955
Western Florida	Aug. 15, 1955	Edward J. Collins	Oct. 15, 1955
East Bay	Aug. 15, 1955	Guy Black	Resigned
Western New York	Sept. 15, 1955	Edward Graf	Nov. 21, 1955
Eastern New York	Oct. 14, 1955	Stephen J. Neason	Dec. 14, 1955
Ohio	Oct. 14, 1955	John E. Siringir	Dec. 14, 1955
Alabama	Oct. 14, 1955	Joe A. Shannon	Dec. 14, 1955
Quebec *	Oct. 14, 1955	Gordon A. Lynn	Dec. 15, 1955
Illinois	Oct. 14, 1955	George T. Schreiber	Dec. 15, 1955
Alaska	Nov. 15, 1955	Dave A. Fulton	Jan. 15, 1956

\* In Canadian Sections nominating petitions for Section Managers must be addressed to Canadian Director Alex Reid, 169 Logan Ave., St. Lambert, Quebec. To be valid, petitions must be filed with him on or before closing dates named.

## ELECTION RESULTS

Valid petitions nominating a single candidate as Section Manager were filed by members in the following Sections, completing their election in accordance with regular League policy, each term of office starting on the date given.

Nebraska	Floyd B. Campbell, W0CBH	April 15, 1955
Saskatchewan	Harold R. Horn, VE5HR	April 15, 1955
North Dakota	Elmer J. Gabel, W0K7Z	June 15, 1955
New York City		
Long Island	Harry J. Dannels, W2TUK	July 31, 1955
San Francisco	Walter A. Buckley, W6GGC	Aug. 14, 1955

In the New Mexico Section of the West Gulf Division, Mr. Einar H. Morterud, W5FPB, and Mr. Travis W. Andrews, W5B1H, were nominated. Mr. Morterud received 100 votes and Mr. Andrews received 69 votes. Mr. Morterud's term of office began May 4, 1955.

In the Wisconsin Section of the Central Division, Mr. Reno W. Goetsch, W9RQM, Mr. Lloyd D. Watson, W9LXA, and Mr. Elton L. Miottel, W9BVG, were nominated. Mr. Goetsch received 303 votes, Mr. Watson received 83 votes, and Mr. Miottel received 81 votes. Mr. Goetsch's term of office began May 12, 1955.

In the Maine Section of the New England Division, Mr. Allan D. Duntley, W1BPI/YA, and Mr. Carl E. Watson, W1LJA, were nominated. Mr. Duntley received 113 votes and Mr. Watson received 52 votes. Mr. Duntley's term of office began May 16, 1955.

In the South Dakota Section of the Dakota Division, Mr. Les Price, W0FLP, and Mr. John W. Sikorski, W0RRN, were nominated. Mr. Price received 75 votes and Mr. Sikorski received 61 votes. Mr. Price's term of office began July 2, 1955.

## CODE PROFICIENCY PROGRAM

Twice each month special transmissions are made to enable you to qualify for the ARRL Code Proficiency Certificate. The next qualifying run from WIAW will be made on August 16th at 2130 EDST. Identical texts will be sent simultaneously by automatic transmitters on 1885, 3555, 7125, 14,100, 21,010, 52,000 and 145,600 kc. The next qualifying run from W6OWP only will be transmitted on August 5th at 2100 PDST on 3590 and 7138 kc.

Any person may apply; neither ARRL membership nor an amateur license is required. Send copies of all qualifying runs to ARRL for grading, stating the call of the station you copied. If you qualify at one of the six speeds transmitted, 10 through 35 w.p.m., you will receive a certificate. If your initial qualification is for a speed below 35 w.p.m., you may try later for endorsement stickers.

Code-practice transmissions will be made from WIAW each evening at 2130 EDST. Speeds are 15, 20, 25, 30 and 35 w.p.m. on Monday, Wednesday and Friday, and 5, 7½, 10 and 13 w.p.m. on Sunday, Tuesday, Thursday and Saturday. Approximately 10 minutes' practice is given at each speed. References to texts used on several of the transmissions are given below. These make it possible to check your copy.

Date	Subject of Practice Text from June QST
Aug. 1st:	A Broadband Antenna for 75 meters, p. 11
Aug. 4th:	Parallel 6146s . . . p. 14
Aug. 9th:	Better Selectivity . . . p. 18
Aug. 12th:	Elementary TV Trouble Shooting, p. 23
Aug. 17th:	Modifications in the Viking II, p. 27
Aug. 23rd:	Board Meeting Highlights, p. 32-A
Aug. 26th:	A 5-Over-5 for 50 Mc., p. 36
Aug. 30th:	21st ARRL Sweepstakes Results, p. 48

## NATIONAL CALLING AND EMERGENCY FREQUENCIES (kc.)

C.W.: 3550, 7100, 14,050, 21,050, 28,100.

'Phone: 3875, 7250, 14,225, 21,400, 29,640.

## DXCC NOTES

In accordance with the DXCC rules, "Confirmations from additional countries may be submitted for credit each time ten additional confirmations are available." The large number of cards currently being submitted in batches smaller than the required ten is resulting in a tremendous amount of extra work and consequent delay in handling. These can be reduced if DXCC members will adhere to this rule. Endorsements (and subsequent QST DXCC box men-

tion) are issued only when sufficient cards are submitted to increase a total from one bracket (110, 120, 130, etc.) to another. There is, therefore, no point to sending confirmations that increase a total from 135 to 137, for example. In such a case, a member may, of course, submit only five cards, to bring his total to 140.

In order that the Honor Roll listings and W/VE/VO Call Area and Continental Leader listings may be maintained from month to month, three exceptions to the rule are allowed: (1) If you already have credit for 235 or more countries (c.w./phone), or can bring your total above 235 by submitting fewer than the ten cards required by the rules, we invite you to do so. (2) If you already have credit for 200 or more countries on 'phone, or can bring your total above the 200 mark by submitting fewer than ten cards, you are similarly invited to send in the additional confirmations. (3) If a W/VE/VO can bring his total above, or tie, that of the leader in his call area, or those outside of W/VE/VO can tie, or bring their totals above the leader on their continent as shown in the DXCC box.

• All operating amateurs are invited to report to the SCM on the first of each month, covering station activities for the preceding month. Radio Club news is also desired by SCMs for inclusion in these columns. The addresses of all SCMs will be found on page 6.

## ATLANTIC DIVISION

**EASTERN PENNSYLVANIA** — SCM, Clarence Snyder, W3PYF — SEC, NNT, RM: AXA, PAM: TEJ, E. Pa. Nets: 3610 and 3850 kc. New club officers announced by the Harrisburg Radio Amateur Club are VDA, pres.; YAH, vice-pres.; TMN, secy.; ADE, treas. Delaware-Lehigh ARC new officers are CBN, pres.; ZOM, vice-pres.; ZBE, secy.; QBF, treas.; and NF, act. mgr. The North Penn Amateur Radio Club reports PNL, pres.; VST, vice-pres.; WN3ZXV, secy.; and VTR, treas. This new club now boasts 98 members and still is growing. WUE made BPL for the first time. TEJ is the new E. Pa. PAM. NNT is the new SEC. BAC is now General Class and an OES. TTW has a new B&W 5100. ABT, at U. of P. ARC, had closed circuit TV and message-handling at the Annual Engineers and Architects Day. UKJ and her dad, UKF, are on a three-month vacation in Chile. The Eastern Pennsylvania C.D. Phone Net had a dinner at Bethlehem on May 7th. UA, State Radio Officer, was the main speaker. TEJ is looking for new members for PFN. The Net meets Mon. through Fri. at 1815 EDT. YDX was very active during the Mother's Day message rush and used a wire recorder to copy messages to speed up air time and transcribed them later. YA, ADF, BN, and MLY were present at the signing of the license plate bill by Gov. Leader. May I take this opportunity to thank Bill, BIP, for the good job he has done as SCM and for the cooperation he has given me in this new job. QOL is building a new kw., rockbound on 3850 kc., the PFN frequency. UQJ worked AJD on 220 Mc. for AJD's first contact on that band. BIP, now in retirement, is building a new shack and will be running high power by fall. Philadelphia received approval of the State Plan for RACES on May 10th. UA reports that the Cumberland County Plan also has been approved by FCDA and FCC and will be used as a model plan by other counties. The Tamaqua ARC holds code instruction every night at 7:00 p.m. PLY was elected manager of the AN Net for the fourth year. The Pennsylvania Phone Net will picnic at Hershey Park on August 14th. E. Pa. C.W. Net will picnic on the same day at a place to be announced. Traffic: W3CUL 1549, WUE 505, YDX 412, OK 214, TEJ 139, OZV 115, BNR 95, VVV 81, AXA 77, DUE 66, PLY 47, UWP 46, ABT 37, TAW 35, ELI 26, VOI 18, PLY 16, EAN 14, TTW 14, QZL 12, YGX 12, JNQ 3, ADE 2.

**MARYLAND-DELAWARE-DISTRICT OF COLUMBIA** — SCM, John W. Gore, W3PRL — WG and his family more than likely would take first place as a ham family in this area. The members of the family holding Novice calls are NYL, Peggy, ZQF; Freddie, 17, ZQL; Margat, 14, ZTE; Candy, 12, ZVE; Mike, 10, ZVD. It is expected that general calls will be acquired during the school holidays. The only other member of the family, Chris (6), has been subjected to all the di-dahing around the house by his brothers and sisters and has inhaled half the Morse alphabet and may be ready for a Novice ticket by the time he starts school in the fall. Governor McKeldin proclaimed the week of June 19-25 "Amateur Radio Week" for the State of Maryland. MTE describing "Wavemeters" on May 9th and JCI advising as to "Some uses for O-1 MA Meters" on May 23rd were the programs of the CARC, Baltimore. EQK presented film showing his Florida and Havana trip at the BARC meeting May 2nd. QZC is headed for Emory University in Georgia to study medicine and acquire a W4 call. UCR, at Aberdeen, acted as NCS for communications for the Convoy from Aberdeen to Baltimore on Armed Forces Day. ZOG-M/3 was stationed at Sheridan Armory; SCFN-M/3 and 90KI-M/3 were at Turner Armory; NNX and 5HOE-M/3 also participated. NNX acting as relay between the mobiles and Aberdeen. EQK was operated upon on the Tuesday after Easter. His convalescent period provided ample time for hamming, checking the transmitter, renewing tubes, with time out for a week's visit to

Ocean City, etc. RV reports the AEA Windbay Net started operation on 50.4 Mc. June 15th, shifting from 7240 kc. BKE would like schedules. He can handle traffic into Washington. ECP reports that the Washington TVI Committee shortly will release a film project which uses the REA film "Typical Television Interference Patterns" with an introduction by George E. Sterling, DF1AE, a former member of the FCC. The Washington Radio Club code class, which held its last meeting May 26th, resulted in Novice license qualification by 100 per cent of the group that completed the course, 60 per cent of which started the course last October. K3WBJ, Walter Reed Army Medical Center, now has two operators assigned full time, 1-SDO and 1-RKB. COK has at last worked his first JA and needs only two more cards to make DXCC. OYX, OXL, AKX, TJV, YRK, and VAM I participated in the CD Test "Operation Frederick Fireball" held May 15th. ZGN and AKC, of Frederick, have graduated to General Class. ZGN with perfect copy for his 5-minute code test. Traffic: (May) W3WVG 1377, WY 438, K3WBJ 500, W3UE 319, COK 155, RV 96, PKC 66, ECP 43, PG 29, BUD 8, NNX 6, OYX 4, BKE 3, WKB 2, (Apr.) W3WVG 661, CVE 238, TMZ 22, UCR 12, NNX 8, MCD 6, CDG 2.

**SOUTHERN NEW JERSEY** — SCM, Herbert C. Brooks, K2BG — SEC, W2ZVW, PAM, ZI, YRV now is manager of the Delaware Valley 2-Meter Net. Was also set up amateur equipment at the Philadelphia Electric Co. Hobby Show and handled traffic from the visitors. New Jersey Net (80-meter c.w.) members are planning a picnic for this summer. EAS is net manager. K2H2R is working hard trying to make WAS on 40 meters. Congratulations to K2CPR on having received the BERTA (British Empire DX Award), also WBE, Jack also is an Official Observer. ZVW is rebuilding between skeels. The Camden County (Area 11) RACES station has been put into operation and tests have been made with the Burlington County (Area 10) station. RG is Radio Officer of the Camden station and UA is RO of Area 10. Congratulations to the Tri-City Amateur Radio Club on becoming an ARRL affiliated club. We look forward to reporting the Club's activities each month in this column. K2CEF, reporter of the Southern Counties Radio Assn. news, is being transferred to the Naval Air Tech. Training Center, Memphis, Tenn. SDO recently erected an NJK antenna. 380B expects to be a W2 soon. K2BWG is headed for Japan. Good luck, Cliff. Scuttlebutt, the Hamilton Twp. Radio Assn. news, reports plenty of building. Special mention is made of BDA, BDK, EWS, CEP, and BMX. A Section Net certificate has been issued to SUG, Milford. UKS is Chief RO on the SS *North American*. Look for Bill operating NIM. K2INQ is operating 2-meter mobile. We wish HAZ a speedy and complete recovery from his recent operation. Traffic: W2RG 168, YRW 112, ZVW 80, K2H2R 55, BG 19, W2ASG 9, ZI 9, K2CPR 7.

**WESTERN NEW YORK** — SCM, Edward G. Graf, W2SJV — Asst. SCM: Jeanne Walker, 2BTB. SEC: UTH/FRL, RM: RUF, PAMs: NAI and TEP. NYS meets on 3610 kc. at 6 p.m. and 6:30 a.m.; NYSS on 3595 kc. at 5:30 p.m.; NYS on 3925 kc. at 6 p.m.; NYS C.D. on 3509.5 and 3993 kc. at 9 a.m. Sun.; TCPN 2nd Call Area on 3970 kc. at 7 p.m.; SRPN on 3970 kc. at 10 a.m.; ISPN on 3980 kc. at 3 p.m. The W.N.Y. Hamfest, sponsored by the RARA, was one of the most successful with 476 in attendance. The AREC meeting was addressed by RUF, mgr. NYS C.W.; AQY, asst. mgr. NYS Phone; ZOL, representing TCPN; with UTH, the SEC, as M.C. At a meeting in Syracuse, called by the Onondaga Co. EC, CYD, a Red Cross Amateur Radio Net for Central New York was organized, comprising the counties of Cortland, Cayuga, Oswego, Jefferson, Oneida, Madison, and Onondaga. The following were in attendance: BCK, RIP, JNM, VQV, RUT, CNO, ZHU, K2s DXP, DYB, CNR, FAA, FCD, and DUR. CYD, SZG, JPO, YEU, and K2KGQ represented CRD, the amateur station of the Red Cross. More stations are needed, especially in Jefferson Co. The Net will operate on 3925 kc. at 8:00 p.m. the 1st Mon. of each month. Officers of the Batavia Area are HJN, pres.; JIE, vice-pres.; K2DVC, secy. and comm. ch.; TON, treas. YGW has the call K2LSF for a second location. K2EVP reports K2GNG now is located at Fort Meade, Md. The power now is 60 watts at K2CLA. The RAWNY board meeting was held at the QTH of K2DJN. NYS Phone Net Mgr. TEP compiled the first issue of the Net sheets *Zero Beat*. EMW's DX now is 202 worked and 193 confirmed. Erie Co. C.D. issues a monthly bulletin edited by DVD. HVZ will continue to manage the a.m. session of NYS C.W. from Lake Placid for the summer and from college in the fall. The Elmira Area meeting was devoted to FD planning. RZP, PPY, and HXG renewed as EC. Thanks to IEP for

issuing the FB roster of the NYS 'Phone Net. Officers are TEP, net mgr.; AQY, asst. mgr.; NJL, net secy. QLI is busy rebuilding glass-melting units at Corning. After an absence of 18 years, ex-ICJ is back on as SSJ at Niagara Falls using a Viking II and an SX-96. Officers of the new Radio Amateurs of Greater Syracuse (RAGS) are RWJ, pres.; KUD, vice-pres.; ZCZ, secy.; TEB, treas. Former Rocky Mt. Director now is located at Potsdam with the call BB. The Otsego Co. AREC Net on 29.6 Mc. is monitored and/or operated 15 hours daily with one or more guard units on duty. AREC C.D. of Oneida Co. was very active in the April 30th test. The Rome Radio Club emergency unit, which is a converted school bus, now is in operation with 6 operating positions, a Viking II, 2, 6-, and 10-meter units. The net frequency is 3905 kc. Congrats to the Watertown Club, now an ARRL affiliate. CXM has been appointed OPS. Net Certificates were issued to EEB, BWK, DYB, and K2s DIO and HOS. Traffic: W2RUF 409, K2CLA 362, W2ZRC 304, HKA 251, K2IDJN 177, W2CXM 131, K2DSR 123, LSF 84, W2OE 61, OZR 57, K2IVZ 48, W2EMW 42, ZLT 39, DSS 26, RUT 21, SJV 14, FEB 13, UTH 7, K2AHM 6.

**WESTERN PENNSYLVANIA**—SCM, R. M. Heck, W3NCD—SEC: GEG. RMs: UHN, NUG, NRE, and GEG. PAMs: AER and VKD. Altoona items courtesy of KQD: The Muleshoe Radio Club class members under KQD produced the following new hams: WNs ZUF, BMU, CHO, and W3ZKM, ZUG, ZVA, and AFH. ZVA has a kw, and ZUG is mobile. The Horse Shoe Radio Club class members produced the following new hams: WN3s BKV, BSR, BVE, BZN, BTX, and AUD, with LQD as tutor. KFD, the president of HIRC, has gone mobile. LQD has loaned out 5 transmitters to Novices. UHM, almost mobile, and OUA are working on Scott Township c.d. outfit. ZDW is working 20-meter DX, OKU is s.s.b. on 40 meters. UUH is working 10 meters and putting finishing touches on mobile installation. The SCARC station now has 2- and 6-meter beams up. WHI is on 10 meters. VEF is mobile. 1MCA, formerly 3TMA, is on 3525 kc. week ends, TCP is radio-activating model airplanes. PTU is on the Commuters Net with RMX and others. On 10 meters we find RLH, SUL, and IIX. TYC still is with YLRL *News and Nets*. The Penn Central Radio Club of Falls Creek is an ARRL affiliate. The Breeze Shooters Hamfest was enjoyed by all. The SHIBPM outfit was at South Park for Field Day. New rigs: RYK has a BW 5100, KILL a Heath DX100. We find WN3CGP, MWG, KYC, BDW, and UJP working on antennas. UVD says the Weather Net now has 15 members. However, he could use help from Warren, Pa., and Olean, N. Y. If interested contact him via W. Pa. Net 3585 kc. at 6:30 p.m. The Indiana Amateur Radio Club operated on Field Day using club station call BMD. VKD says the 20-meter band is giving the DX fellow a break these days. Ed Balogh, formerly of Indiana, now is 6VHC. The West Alb. C.D. Net is getting regular attendance from those using State-owned power plants. The West Charlie Net is getting off to a good start. KA2DV/W3WIW is back in the States. VKD received first place award for W3 in the VK/ZL 1954 Fall Contest. VKD was visited by SDQ, of Akron, who now is on all bands using a new Johnson KW. At a recent Radio Association of Erie meeting a pocket-sized 10-meter receiver was demonstrated by MED. YWL says his son YMW, Grove City College, has been working back home on 75 meters. NXX has a new Elmac for mobile. Recently visiting in Erie were 8BQO, 4BHN, and 8BKM. The untimely death of GV comes as a shock to his many friends. The newly-elected directors of the RAE are Doc Sheldon and Bart Geer. WDK and YKE now have DX100 kits. OIH now has new Morrow converter. Mercer County Radio Association members who turned out in the recent nationwide Civil Defense Test were QHS, VK, SYZ, YEW, and GEG. Traffic: (May) W3W1Q 2757, LXQ 96, YA 49, UHN 42, TAW 35, NUG 24, KNQ 19, VKD 11, NCD 10, KUN 3. (Apr.) W3NUG 15. (Mar.) W3NUG 26.

## CENTRAL DIVISION

**ILLINOIS**—SCM, George T. Schreiber, W9YIX—Section nets: ILB c.w., 3515 kc. Mon. through Sat.; IEN 'phone, 3940 kc. RAE: BUK and MRQ. PAM: UQT. EC: HOA. EC Cook County: HPG. Congratulations to LOY and YBC, elected respectively to the national presidency and vice-presidency of the YLRL. Only three made BPL this month: DO, c.w.; and IDA and YWL, 'phone. YWL made it for the third month in a row. Nice going, fellows. Incidentally, there are new grandsons for DO and VHD. And while the congratulations are being passed out, flowers to HYK, who celebrated his 82nd birthday, and to WPY, who is a young 76. A new ORS this month is ZMJ. EC for Schuyler County is BH; for Rock Island and Mercer County RYU; Mason, VBH, and Hancock OXS. The Nonand Net of MARS has been reactivated with the following reorganizing members: YEZ, JGL, KHL, MRK, QAO, ZGX, LSQ, DEI, RHN, EXG, and SH. The Net meets on 27,994 kc. Wed. at 10 p.m. Central Time. ITM and QMO now are members of the U. S. Coast Guard Auxiliary. Lightning struck the antenna of HUX and caused severe damage to both the transmitter and receiver. USI is pleased with the increasing activity on 6 meters. CSW

tells us the North Central 'Phone Net completed two years on the air in May and rolled up a traffic total for the month of 531 messages. NIU is mourning the storm damage to a tree that held his antenna and moans the fact he now will have to put up a stick. Congrats to OQI and his XYL, UXL, on their new son, Stephen; and additionally to UXL, who finally worked her 48th state, Wyoming. The OM has only 47 at this writing. CLH tells us he is on all bands 160- to 10-meter 'phone and c.w. PCF plans a cubical quad as a summer project and also a three-band vertical to try and snatch some of those rare ones from GD1, his neighbor. New calls heard are Novices UGA, YN1, and ZOR; Technical NAX; and General FCC. No, he is not an R.I. The Kankakee Novice Net meets at 2100 Daylight Time Mon. through Sun. on 3735 kc. Present members are WNS, OUS, NAX, YN1, ZOR, TBX, and TXH. The St. Clair County Amateur Radio Club issued 10-contact certificates to KUJ and Novice OAN. UWP has an Elmac in his car and enjoys mobile. RSY and RSZ, father and son, have a new NC-125 on their operating table. BPU spent a well-earned vacation in the Southland visiting some of the ham friends he has worked these many years. The summer slump in news seems to have set in, fellows; send in your items by the fifth of the month. Watch for the announcement soon of the Illinois QSO Party. Traffic: W9DO 1428, YWL 855, IDA 617, CSW 250, AA 149, YIX 55, VHD 50, BUK 47, VXS 43, SMI 41, CEE 38, STZ 35, USI 34, QQG 31, ZMJ 31, CZB 28, CTZ 26, VEY 25, LXJ 19, OVH 18, OR 17, FRP 14, PHE 13, MRQ 10, LL 8, BA 2, UVM/9 2, KLD 1. (Apr.) W9UVM/9 7.

**INDIANA**—SCM, George H. Graue, W9BKJ—Communications for the Armed Forces Parade in Evansville were handled by RACES members. FJI, ABW, and LBD assisted in a Boy Scout Camporee radio demonstration at Garvin Park. BKJ and EOG furnished communications for Anthony Wayne Council, Boy Scouts, at its annual Camporee at Columbia City. PMT and FMJ assisted in Ft. Wayne. More than 1500 boys made up the tent city. Code practice was sent by FMJ and several boys made perfect copies. ZIJ has joined the Marines. NTR is leaving for Texas for the summer. WUH is the new Vanderberg County EC. New at Vincennes are N9RFA, NSN, VSD, YSH, and VZK. DIR received appointment to the Air Academy at Denver. 6PKM, ex-N9EC, visited Evansville. EHU again was winner of the hidden transmitter hunt. TARS will award a DX-100 transmitter at the annual hamfest Aug. 28th. MOC/KL7 and SCX/VO6 can be contacted on 20-meter 'phone. EGQ, EQO, and NTA are the proud possessors of the A-1 Operators Award. CAEN reports 22 sessions with a traffic total of 41. WWT reports for RFN with a traffic total of 175. IFN Net, as reported by NTA, had 53 sessions and traffic total of 239. MARC members SIHW, DDA, BRM, NAR, EZS, and YRF assisted in the Armed Forces Day Parade in South Bend. SMW has a DX-100. ZHJ has a new Viking Ranger. ZDS is being transferred to New Orleans. MAM overhauled the club's 2½-kw. power plant. TT has a new telephone pole for a mast. BKJ's old rig is no more. VNV and KDV are taking a two-month cruise on the Mediterranean Sea. EQO is building an s.s.b. exciter. CEA is a new ORS. NTR has a new 75A-4 receiver. EHU made DXCC. DKR finally is on 3.9-Mc mobile. UTL won the 'phone SS award for this section. NH is rebuilding again. AYD has a Viking mobile installation. JUJ's report was received after making BPL 48 consecutive times. Traffic: W9NZZ 1029, TT 707, WWT 420, UQP 182, EHZ 142, BKJ 131, ZYK 116, STC 85, WBA 85, DHJ 83, CTF 81, NTA 70, QYQ 62, TQC 58, VNV 48, PQA 47, SKP 42, HRY 39, DOK 36, SVL 29, AZF 24, CMT 24, WRO 24, WUH 20, ALL 19, CEA 18, TG 17, EQO 16, CC 14, GDL 13, ZIB 13, BDP 12, YVS 11, QR 10, HSG 5, NTR 5, FGX 4, PIN 4, DKR 3, KDV 3, UTL 3, NH 2, PPI 1.

**WISCONSIN**—SCM, Reno W. Goetsch, W9RQM—SEC: OVO. PAMs: ESI and GMY. RMs: IXA and RTP. Nets: WIN, 3685 kc., 7 p.m. daily; BEN, 3950 kc., 6 p.m. daily; WPN, 3950 kc., 1215 Mon.-Sat., 0930 Sun. Wisconsin mobile and c.d. frequency: 29,620 kc. CXY participated in Armed Forces Day with QSOs with WAR, AIR, and NSS. FFC received his 20-w.p.m. Code Proficiency certification. DVM worked 8 states with his Ranger loaded up to his screen window! CCO received a QSL from ZL2FI. CHD is on 14 Mc. IIDQ, GZS, and CDD are going to give 50 Mc. a whirl. ZLD is president of UW Ext. Club. HAT is mobile on 4 Mc. AJU's dad WN9VFO and sister WN9VFP are new calls in Ashland. AJU takes over as WPN mgr., replacing SAA, who is QRL with other duties. DIK has a new Heathkit VFO. IJU reports the Polecats well represented at the Monroe Hamfest. IAL has a new NC-240D. KKK is shopping for a new 20-meter beam since a wind-storm blew down his old one. ECs KTE, REQ, and IYF are promoting activities on 29,620 kc. IDH is rebuilding. ONY has worked 14 countries from mobile. GHG has a Viking II and an S-76. After an absence of 20 years, KNP is back in Milwaukee on s.s.b. with an 813 and HRO-50T w/slicer. LDH and DJE are active on RTTY. FAF and VYO are active on 7-Mc. 'phone. YZA worked WAC in 4 days using a Viking II and a 44-ft. vertical. Congrats to IIQT, who has a new baby girl. OLV is on with a Viking

(Continued on page 78)

## Tee-Notch Filters

MANY times in a ham shack or in the laboratory, occasion arises for the need of a simple circuit which can be used to "null out" or "notch out" a very narrow band of frequencies. For example, at audio frequencies if an amplifier were fed with a 400 C.P.S. input signal, if at the output we could trap out the 400 C.P.S., the remaining audio power present would be the harmonics of the original 400 C.P.S. and thus would be had a simple and effective distortion factor meter.

A BRIDGED tee network that performs this function has been available for a number of years and has been used at audio and also r.f. frequency to at least as high as 50 Mc.

WE at Hallicrafters prefer to call it a tee-notch filter and we use it for all sorts of trap circuits around the plant and in the laboratory and also find it very effective to trap the fundamental output of a transmitter to measure the remaining total harmonics.

ONE fine feature of this network is that its insertion loss is reasonable, about 3 db at 50 kc., and also, its suppression of the desired frequency may be as much as 60 db. It's simple, stable, and normally does not require any tubes if the circuit to which it is added has 3 db. of reserve gain.

WE feel that this tee-notch filter has many advantages in receivers and for those of you that want more detail a data sheet has been prepared. A postal or QSL card addressed to me will insure that you will receive one of these sheets.

—Fritz Franke

## Heathkit VFO KIT

MODEL VF-1

**\$19.50**

Ship. Wt. 7 lbs.

Here is the new Heathkit VFO you have been waiting for. The perfect companion to the Heathkit Model AT-1 Transmitter. It has sufficient output to drive any multi-stage transmitter of modern design. A terrific combination of outstanding features at a low kit price. Good mechanical and electrical design insures operating stability. Coils are wound on heavy duty ceramic forms, using Litz or double cellulose wire coated with polystyrene cement. Variable capacitor is of differential type construction, especially designed for maximum bandspread and features ceramic insulation and double bearings.

This kit is furnished with a carefully precalibrated dial which provides well over two feet of calibrated dial scale. Smooth acting vernier reduction drive insures easy tuning and zero beating. Power requirements 6.3 volts AC at .45 amperes and 250 volts DC at 15 mills. Just plug it into the power receptacle provided on the rear of the AT-1 Transmitter Kit. The VFO coaxial output cable terminates in plastic plug to fit standard 1/4" crystal holder. Construction is simple and wiring is easy.

- Smooth acting illuminated and precalibrated dial.
- 6AU6 electron coupled Clapp oscillator and OAZ voltage regulator.
- 10 Volt average output on fundamental frequencies.
- 7 Band calibration, 160 through 10 meters, from 3 basic oscillator frequencies.

Open layout—easy to build—simplified wiring.

Smooth acting illuminated dial drive.

Clean appearance—rugged construction—accessible calibrating adjustments.

Ceramic coil forms—differential condenser.

Copper plated chassis—careful shielding.

## Heathkit AMATEUR TRANSMITTER KIT

MODEL AT-1

**\$29.50**

Ship. Wt. 16 lbs.

### SPECIFICATIONS:

Range 80, 40, 20, 15, 11, 10 meters.  
6AG7 ..... Oscillator-multiplier.  
6L6 ..... Mixer-oscillator.  
504G ..... Amplifier-doubler.  
105-125 Volt A.C. 50-60 cycles 100 watts. Size: 8 1/2 inch high x 13 1/8 inch wide x 7 inch deep.

Crystal or VFO excitation.

Prewound coils—metered operation.

52 ohm coaxial output.

Rugged, clean construction.

Single knob band switching.

Built-in power supply.

Here is a major Heathkit addition to the Ham radio field, the AT-1 Transmitter Kit, incorporating many desirable design features at the lowest possible dollar-per-watts price. Panel mounted crystal socket, stand-by switch, key click filter, A. C. line filtering, good shielding, etc. VFO or crystal excitation—up to 35 watts input. Built-in power supply provides 425 volts at 100 MA. Amazingly low kit price includes all circuit components, tubes, cabinet, punched chassis, and detailed construction manual.

## Heathkit COMMUNICATIONS RECEIVER KIT

Four band operation 535 to 35 Mc.

Stable BFO oscillator circuit.

RF gain control with AVC or MVC.

5 1/2 inch PM Speaker-Headphone Jack.

Six tube transformer operation.

Electrical bandspread and scale.

Noise limiter—standby switch.

### SPECIFICATIONS:

Range.....535 Kc to 35 Mc  
12BE6 ..... Mixer-oscillator  
12BA6 ..... I. F. Amplifier  
12AV6 Detector—AVC—audio  
12BA6 ..... B. F. O. oscillator  
12A6 ..... Beam power output  
5Y3GT ..... Rectifier  
105 - 125 volts A.C. 50-60 cycles, 45 watts.

A new Heathkit AR-2 communications receiver. The ideal companion piece for the AT-1 Transmitter. Electrical bandspread scale for tuning and logging convenience. High gain miniature tubes and IF transformers for high sensitivity and good signal to noise ratio. Construct your own Communications Receiver at a very substantial saving. Supplied with all tubes, punched and formed sheet metal parts, speaker, circuit components, and detailed step-by-step construction manual.

MODEL AR-2

**\$25.50**

Ship. Wt. 12 lbs.

### CABINET:

Proxylon impregnated fabric covered plywood cabinet. Shpg. weight 5 lbs. Number 91-10, \$4.50.

**HEATH COMPANY**  
BENTON HARBOR 9, MICHIGAN

# New HEATHKIT DX-100

# PHONE AND CW TRANSMITTER KIT

MODEL DX-100

Shpg. Wt. 120 lbs.

**\$189.50**

Shipped motor freight unless otherwise specified. \$50.00 deposit with C.O.D. orders.

- R.F. output 100 watts Phone, 125 watts CW.
- Built-in VFO, modulator, power supplies. Kit includes all components, tubes, cabinet and detailed construction manual.
- Crystal or VFO operation (crystals not included with kit).
- Pi network output, matches 50-600 ohms non-reactive load. Reduces harmonic output.
- Treated for TVI suppression by extensive shielding and filtering.
- Single knob bandswitching, 160 meters through 10 meters.
- Pre-punched chassis, well illustrated construction manual, high quality components used throughout—sturdy mechanical assembly.

This modern-design Transmitter has its own VFO and plate-modulator built in to provide CW or phone operation from 160 meters through 10 meters. It is TVI suppressed, with all incoming and out-going circuits filtered, plenty of shielding, and strong metal cabinet with interlocking seams. Uses pi network interstage and output coupling. R.F. output 100 watts phone, . . . . . 125 watts CW. Switch-selection of VFO or 4 crystals (crystals not included).

Incorporates high quality features not expected at this price level. Copper plated chassis—wide-spaced tuning capacitors — excellent quality components throughout—illuminated VFO dial and meter face—remote socket for connection of external switch or control of an external antenna relay. Preformed wiring harness—concentric control shafts. Plenty of step-by-step instructions and pictorial diagrams.

All power supplies built-in. Covers 160, 80, 40, 20, 15, 11 and 10 meters with single-knob bandswitching. Panel meter reads Driver Ip Final Ig, Ip, and Ep, and Modulator Ip. Uses 6AU6 VFO, 12BY7 Xtal osc.-buffer, 5763 driver, and parallel 6146 final. 12AX7 speech amp., 12BY7 driver, push-pull 1625 modulators. Power supplies use 5V4 low voltage rect., 6AL5 bias rect., 0A2 VFO voltage reg., (2) 5R4GY hi voltage rect., and 6AQ5 clamp tube. R.F. output to coax. connector. Overall dimensions 20 3/4" W x 13 3/4" H x 16" D.

## Heathkit GRID DIP METER KIT

MODEL GD-1B

**\$19.50** Shpg. Wt. 4 lbs.

with additional blank dials for individual calibration. You'll like the ready convenience and smart appearance of this kit with its baked enamel panel and crackle finish cabinet.

The Invaluable Instrument for all Hams. Numerous applications such as retuning, neutralization, locating parasites, correcting TVI, adjusting antennas, design procedures, etc. Receiver applications include measuring C, L and Q of components—determining RF circuit resonant frequencies.

Covers 80, 40, 20, 11, 10, 6, 2, and 1 1/4 meter Ham bands. Complete frequency coverage from 2—250 Mc, using ready-wound plug-in coils provided with the kit. Accessory coil kit, Part 341-A at \$3.00 extends low frequency range to 350 Kc. Dial correlation curves furnished.

Compact construction, one hand operation, AC transformer operated, variable sensitivity control, thumb wheel drive, and direct reading calibrations. Precalibrated dial

## Heathkit ANTENNA COUPLER KIT

MODEL AC-1

**\$14.50** Shpg. Wt. 4 lbs.

Poor matching allows valuable communications energy to be lost. The Model AC-1 will properly match your low power transmitter to an end-fed long wire antenna. Also attenuates signals above 36 Mc, reducing TVI. 52 ohm coax. input—power up to 75 watts—10 through 80 meters—tapped inductor and variable condenser—neon RF indicator—copper plated chassis and high quality components.

## Heathkit ANTENNA IMPEDANCE METER KIT

MODEL AM-1

**\$14.50** Shpg. Wt. 2 lbs.

Use the Model AM-1 in conjunction with a signal source for measuring antenna impedance, line matching purposes, adjustment of beam and mobile antennas, and to insure proper impedance match for optimum overall system operation. Will double, also, as a phone monitor or relative field strength indicator.

100  $\mu$ a. meter employed. Covers the range from 0 to 2000 ohms. Cabinet is only 7" long, 2 1/2" wide, and 3 1/4" deep. An instrument of many uses for the amateur.

BENTON HARBOR 9, MICHIGAN

## AT YOUR DEALERS

## APC Capacitors With E-X-T-E-N-D-E-D Shafts

In response to many requests from amateurs, experimenters and electronic equipment builders, Hammarlund is now offering APC — B Type, and MAPC — B Type Capacitors as standard items through Hammarlund Authorized Dealers.

These are extended-shaft versions of the well-known APC and MAPC capacitors. They permit knob-control or shaft coupling.

The original APC trimmer was designed and first produced by Hammarlund more than 20 years ago, and is used in all classes of equipment where a compact high-quality air dielectric trimmer is needed. The MAPC type is similar to the APC except that it is a miniaturized version.

Range of the APC series is from 3 to 140 mmf and for the MAPC, 2.3 to 100 mmf.

For your free copy of the Hammarlund Capacitor Catalog, which gives listings of the complete line of standard capacitors, write to The Hammarlund Manufacturing Co., Inc., 460 West 34th Street, New York 1. Ask for Bulletin C8.

# HAMMARLUND

(Continued from page 72)  
II and an HRO-50T. IXA put out another FB issue of *WIV* News. The Polecat Net picnic was held June 12th near Green Lake. RACES facilities were given a good workout during the National Test June 15-16. A preliminary meeting of RACES net operators was held in Wausau May 30th. On May 31st NUV was operated on emergency power from Rib Mt. for 12 hours as NCS on 29,620 kc, dispatching mobile units over a radius of 60 miles to time the State Endurance Motorcycle run. Those participating were VHA, JBF, RQM, OVO, RLB, FCF, QJB, and CFT. Traffic: W9CXY 547, SAA 275, FFC 143, DVM 101, IXA 101, CCO 42, RTP 41, BVG 37, YZA 33, AJU 28, RQM 23, GMY 20, SZR 16, KWJ 10, DIK 8, OVO 5, IU 4, RKP 3, UIM 3, IAL 2.

### DAKOTA DIVISION

**NORTH DAKOTA** — This report is being made by W0EOZ in the absence of an SCM. PAM: GZD, PHR. Dakota Division Director, has appointed GZD and EOZ as Assistant Directors for the State. The Jamestown Amateur Radio Club is building an 813 rig. NPR reports he will be QRL this summer working and will not be able to keep up NCS on the phone net. OEL has a Collins now and expects to put up an all-band skywire soon. EOZ has been QRT rebuilding for TVI, and is back on the air after hanging the skywires that came down in the May winds. YIZ is rebuilding. QJP has gone to Camp Grafton for two weeks with the National Guard. AVT has accepted a position with the CAA at Jamestown, but still commutes to Fargo week ends. The Bismarck gang reports the ham-boree is shaping up well. NOTE — In case a new SCM has not been elected by July, please mail or relay your reports to EOZ before July 6th. Traffic: W0VCQ 84, UVH 67, NPR 11, EOZ 2.

**SOUTH DAKOTA** — SCM, J. W. Sikorski, W0RRN — Asst. SCMs: Earl Shirley, 0YQR, and Martha Shirley, 0ZWL. SEC: GCP, PAMs: GDE, BNA, NEO, and PRL. RM: SMV. YQR started out as Pennington-Meade County EC with a bang — signing up ten new AREC members. Bob Mitchell, 1SWX, formerly of Ellsworth AFB, has returned from Europe and has been discharged. He can be reached at his home QTH. SMV stuck up a vertical and his first two contacts were KH6 on 7 Mc. and his first VK in 18 years on 14 Mc. KYL is moving to Sioux Falls. After many months, RRN is mobile with Viking and 3BR. O0Z engineered the job. Net reports: NJQ, QNI 433, traffic 83; 75-net, average daily QNI 35, average daily traffic 6; C.W. Net, 13 sessions, 87 QNI, traffic 45. Since you will have a new SCM next month, I wish to thank you all for your cooperation during the last five years. Traffic: W0GDE 71, PHR 67, SMV 42, SCT 27, BQH 16, RRN 13, RSP 4, O0Z 2, GWS 1.

**MINNESOTA** — SCM, Charles M. Bove, W0MXC — Asst. SCM: Vince Smythe, 0GGQ. RMs: KLG and DQL. PAMs: JIE and UCY. TUS has been appointed OPS. The Minnesota Junior Net, MJN, needs members. The Net meets on 3690 kc, on Mon., Wed., and Fri. KJZ and IRD, both members of the YLRL, attended the YLRL Convention at Milwaukee. Lydia was appointed as Tenth Regional Chairman by that body. She also was instrumental in bringing to the Twin Cities the 1956 YLRL Convention to be held next May 25th, 26th, and 27th. UCE has a six-element beam on 20 meters. Yes, six elements. SFC has a new 500-watt rig on the air. SLH and his XYL were visitors at GWJ's home. It seems that GWJ and LEH were former members in the same Air Force Fighter unit in communications during World War II. They recently set up a 40-meter schedule to continue old friendships. CO is getting a new Collins KW for s.s.b.c. QNY is working on some ARC-5 gear for emergency and mobile. QDP now is ORS. The Stillwater High Radio Club is now officially an ARRL affiliated radio club. Anyone wishing to attend meetings should contact VOC, who lives at 1022 So. 4th St., Stillwater, for information on the time and place. SZJ now has a new Ranger which he assembled. UGV, of Appleton, and RSP, of Marvin N. D., both on 2 meters, held a fine round table with four other stations. SZJ was on 75 meters working cross band. ZSJ was surprised to find that 2 meters is so active in the rural communities. IRJ had a nice visit with EYH at camp. Traffic: W0KLG 183, KFN 143, KJZ 139, WDW 131, WMA 101, TUS 95, QDP 78, DQL 74, IRJ 59, RLQ 43, MVJ 40, UCY 40, MBD 38, WVO 38, RVO 36, GTX 32, FCU 27, LST 26, LUX 24, TKX 22, NTY 20, OPA 20, OSJ 14, VOA 14, WAA 13, MXC 12, BUO 7, HAH 6, AFP 5, QNY 5.

### DELTA DIVISION

**ARKANSAS** — SCM, Owen G. Mahaffey, W5FMF — Your SCM lost out on some of the State activities by having the flu for two weeks. The Union County Amateur Radio Club soon will be on the air with a Viking II and an HQ-140X. The Club is conducting code classes each Tue. and also is working on a civil defense set-up. A new ham at El Dorado is AXQ. ECs for the month are ZBX and ZJL. We are all sorry to hear of NDH's illness and hope he has a speedy recovery. Traffic has picked up on both the c.w. and

(Continued on page 80)

**IT'S HERE!**  
**IT'S ALL NEW!**

**IT'S THE PRO-310!**

**A major achievement in amateur receivers!**

Hammarlund's answer to the requests of hams for a professional receiver at an amateur's price—that's the NEW Pro-310!

Within the new cabinet which has the design of a custom-built professional rig is the amateur receiver of the future—here TODAY!

Look at these features:

- All frequencies can be read to 1 part in 5000.. Bandsread is continuously calibrated over the entire range from 550 KC to 35.5 MC, not just over a couple of selected bands as in most ordinary receivers.
- Single Sideband Operation is yours... because exalted BFO and sharp selectivity are built-in.

- Exceptional Stability.
- High Image Rejection... on all 6 bands. Double conversion on the top 4 bands.
- Your choice of colors... black cabinet with gold trim or grey cabinet with silver trim.
- Other completely new design features . . . including rugged turret, modern etched and plated circuits in the RF section; sectionalized construction; and restful wrist-high controls.

\* \* \*

For more information on the new Pro-310, write to The Hammarlund Manufacturing Company, Inc., 460 West 34th Street, New York 1, N. Y. Ask for Bulletin R-8.

**HAMMARLUND**

**SINCE 1910**

'phone nets. We hope we can continue to improve and think we can as several members are new at handling traffic. Those having appointments, take note of the expiration dates and mail them in for endorsement, please. Traffic: W5WUN 64, SXM 47, VAA 29, JZL 22, DAG 16, FMF 14, EXN 10, HEE 7, RPB 6, VAN 6, SYQ 4, ZJI 2.

**LOUISIANA** — SCM, Thomas J. Morgavi, W5FMO — The Mansfield ARC has become affiliated with ARRL. VRO should be on the air soon with his new Globe King. GFA is going s.s.b. APH has a new mobile rig. SWQ, discharged from the AF, now is living at Vinton. BSR, CCD, ZJS, SKW, and TVH, all mobile, furnished communications for the c.d. police in the Armed Forces Day Parade. The Westside ARC's DX Contest was won by INL, with BUK and KOQ second and third. K5FFA makes BPL again with 906 messages handled. YSN is active on RN5 and MARS. HEEJ resigned as PAM because of poor health and MAV has taken on the job. The Monroe Hamfest was a huge success with an attendance of about 275. New EC's are TKV and RRO. EYF, new OBS, sends Official Bulletins on Mon., Wed., Fri., and Sun. at 8:00 p.m. CST on 7180 kc. New OP's include FKA, SUM, and UGJ. ZAB is going s.s.b. KC had his beam spinning around like a top during a severe windstorm but it was not damaged. He is ORS and DXCC. The Mayor of Buena Park, KSI, met Virginia (the NYL of TIBX) at the New Orleans Airport en route to San Jose, Costa Rica, to meet her OM. EA is looking for 'phone patch traffic into Alexandria. FKA, active in the Baton Rouge Emergency Net, reports HKZ is building a new transmitter. UGJ has a new mobile in operation. Thanks for the reports. Keep them coming. Glad to have met a lot of the fellows at the Baton Rouge and Monroe hamfests. Traffic: K5FFA 906, W5NG 98, NDV 95, MXQ 92, EA 48, UGJ 10, FKA 2, EYF 1.

**MISSISSIPPI** — SCM, Julian G. Blakely, W5WZY — SEC: PFC. PAM; JHS, RM: WZ. This has been a season of hamfests and the "eye-ball" contacts made should carry us through until next season. Don't forget the next big 'fest is at Jackson on the last Sunday in August. JHS won an Elmac Rec. at the Mobile Hamfest. The Centreville Amateur Radio Assn. (CARA) has been organized with W5GIF, pres.; KN5ALP, vice-pres.; Jimmy Templeton, secy.-treas.; GDW, PIO; KN5BAI, act.; FCB, advisor. YAR has been appointed OBS for N. Miss. Listen for the latest League and FCC information on 3935 kc. at 8 p.m. Mon., Wed., and Fri. DRP has General Class license and is our first OES appointee. YFJ has increased power with a BC-610. IGW is running a cool 300 watts on the Mississippi Rebel Net as NCS. Traffic: W5VME 260, IGW 177, YFJ 136, JHS 123, YBH 75, EIDE 54, EWE 36, KYC 27, RIM 17, WZY 16, OTD 14.

**TENNESSEE** — SCM, Harry C. Simpson, W4SCF — SEC: RRV. PAM: PFP. RM: WQW. Congratulations to PVD on the certification of his DXCC. He sends a breakdown on Tennessee DXCC members: TM 213, NNH 182, AZD 170P, MKB 167P, AAW 133, QT 124, AQR 120P, MB 120P, NBV 116, DPE 110, NDE 109P, KKK 102, IIB 101P, GD 101, PVD 100. PL suffered a severe heart attack in mid-May but says he is doing OK. Send him a card, fellows. PFP reports the Mid-Tenn. group has chosen 50.41 Mc. as its 6-meter Net frequency. WQW sends roses to WQT and WOX for their origination of such fine traffic on Armed Forces Day. In turn, they send thanks to those who cooperated with them so nicely. VNE and WQW have been fixing up their shacks. DMU announces that the Davidson County 10-meter Emergency Net meets Sun. and Wed. at 7 CST, 29.6 Mc. He also advises that the Old Hickory Club will send a certificate to any ham working five members. OEZ reports from Nashville that AEE, AY, VFC, and RFR are now on 6 meters; he also says the RACES plan has FCCDA approval. The Middle-Tennessee 2-meter Net shows 14 members on its current roster. ZBQ, on 6 meters, worked 1 Minnesota, 2 Texas, and 2 South Dakota stations and heard a CO2. FLW reports that the Tri-County Club operated on Field Day from Paris Landing State Park. The Memphis Club again is sponsoring a ham school at Memphis State College, under the able direction of DCH. WQT reports the Clarksville ARC operated on Field Day from Howard Petus Park. WOX and YRI are being transferred to Italy. SCF visited OIW, PFP, and WQW and has been modifying an RCA KW, courtesy of the 3rd Army. K4FEU is being transferred to KW6-Land. WIJ is leaving Cookeville, headed for DX-Land, too, says UWA, who is going back to Kentucky for the summer. WXL will be in North Carolina for the summer. Traffic: W4PL 813, K4FEU 246, WIOGG 238, WQT 236, WOX 197, WQW 183, PFP 142, POP 125, IIB 103, SJ 76, YMB 74, JV 57, SCF 53, HIH 18, VJ 31, UWA 20, ZBQ 20, CXY 17, VNE 17, FLW 9, PAH 8, HLR 7, DCH 2, HUT 2, LRO 2, NDC 2, DMU 1, HXS 1, OEZ 1, PVD 1.

## GREAT LAKES DIVISION

**KENTUCKY** — SCM, Robert E. Fields, W4SBI — SEC: CDA. RM: KKW. Acting PAM: NIZ. The Acting PAM reports the following statistics for May: 30 sessions of KPN, 550 total call-ins, 18,333 stations per session, 201 traffic total, 6.7 messages per session. He also reports that traffic is on the increase in spite of the very poor receiving conditions. RM KKW reports for the KYN c.w. nets: 62

sessions, 43 active stations, traffic total 320, 7.4 per session compared to May 1954, with 56 sessions and only 30 active stations. June will have come and gone when you read this, but I am sure you will have enjoyed every minute of it with picnics, hamfests, c.d. test, and last but by far not least, Field Day. OMW has been working some choice DX lately: OE3JIE, 4X4FO, YU3IG, GW3FYR, LA3BD, YN1KK, and H1BLF/T. His DX now totals 85 stations. JSH, chairman for Field Day activities in Lexington, is getting c.d. organized locally. He also is Deputy Communications Director for the 5th mobile support group. ZIB has a walking power mower. We know. We just had a QSO with Moose, ZDA, Doc's NYL, in which she stated that ham radio was much more fun than mowing the lawn. We agree. Traffic: W4KKW 225, K4FAV 112, W4SBI 81, RPF 82, ZDA 69, ZIB 56, QCD 39, HSI 29, BZY 25, KRC 18, JSH 11, BAM 13, SUD 13, WBD 9, IAY 6, JUI 2.

**MICHIGAN** — SCM, Thomas G. Mitchell, WSRAE — Asst. SCMs: Joe Beljan, SSCW (c.w.); Bob Cooper, 8AQA, ('phone). SEC: GJH. It is a real pleasure this month to thank all contributors for the news items received. Keep them rolling in. The one new appointment this month went to WJP as OES. Cliff, formerly 9OC of South Bend, now is residing in Shepherd. DAP is building a new receiver and expects much from it. WVL visited 3MIE after seven years of QSOs and QSPs. FX currently is rebuilding a Traf-He Master. Ex-SCM HKT, the country squire, is "frosted" over his frosted strawberries. HSG is justly proud (and so are we) of his revised ham license plate bill which passed both branches of the Legislature without a single dissenting vote. Cos still is pitching for us and getting the support of his colleagues. PHA is QRX for summer duty at Ft. Campbell, Ky. FSZ reports that SCW admits possession of a microphone, TIJ and RXY have towers back up after a wind storm, and Skutt is QRL painting and fishing. New officers of the Motor City Radio Club are YDR, pres.; PJD, vice-pres.; SKJ, secy.; NBF, treas.; and FWW, custodian. TBP and the Muskegon group still are plugging c.d. work on 29.06 Mc. The Niles Club members are working on common 144 Mc. portable-mobile transmitters and receivers as a club project. These are planned for use in RACES work. UKV introduces NYL UFZ, who used to be 2RTZ. QKQ says that his move threat is over and he expects to stay in Saginaw. MGQ has new 8005 modulator and 4E27s cooking on 75 meters. FGB is wrapped up in 160-meter DXing. He has worked G, VP7, YV5, KP4, and has a heard report from ZL3I! For the rest of us, TIC sums it up pretty well by saying that this warm weather is fine for outdoor work. Traffic: (May) WSNOH 238, PHA 242, NUL 234, ILP 133, FX 119, ZLK 85, SWG 84, DAP 69, SJF 61, SCW 58, IJ 56, QIN 30, QQQ 28, TBP 28, RAE 23, NTC 21, WVL 21, HSG 13, COW 11, DLZ 11, AUD 8, TQP 8, HKT 6, PHM 6, WJO 6, INF 5, FSZ 4, MGQ 4, PDF 3. (Apr.) WSIXN 45, SIB 34, OQH 21, TBP 16, TQP 10, QKQ 8, OT 4. (Mar.) WSTQP 15.

**OHIO** — SCM, John E. Siringer, W8AJW — Asst. SCMs: J. C. Erickson, 8DAE; W. B. Davis, 8JNF; and O. V. Bonnet, 8OVG. SEC: UPB. RMs: DAE and FYO. PAMs: EQN and HUX. New appointments made during May were ZCV as OES and 5BRM/8 as EC. The Wright-Patterson AFB Club used KP as its Field Day call. The Club station call is K8FAD. MGC has installed a V-37 vertical. PBX won first prize at the Madison, Ind., Hamfest. On May 1st the Findlay group had a timed emergency run, (13 minutes for 5 miles), which they feel is mighty good. New Findlay Club officers are QP, pres.; UN, vice-pres.; and QKO, secy. JDN has joined MARS. GDC has installed an emergency-power unit. The Medina Co. Club now meets at the Lodi State Bank Bldg. the last Tue. of each month. WE's NYL has made WAS. BAI is a new Novice in College Hill. Ohio has been well represented in 8RN sessions, according to DBX/SG, net manager, with NVJ, a relative newcomer, carrying much of the load. We have learned that FYO's mother has been seriously ill. We wish her a speedy recovery. WNSVLL, MBE, and MNR finished one-two-three in the Toledo mobile hidden transmitter hunt of May 15th. New Van Wert Club officers are DIIIG, pres.; ASL, vice-pres.; OWC, secy.; AGL, treas.; and PIZ, act. mgr. On May 14/15 the Toledo amateurs had an amateur station set up at the Explorer Scouts Exposition. New Toledo Radio Club officers are BJQ, pres.; BN, vice-pres.; RZQ, rec. secy.; RBX, corr. secy.; and RZM, treas. The CACARC has abandoned the summer picnic but is lining up a technical session for early fall and also planning a county-wide QSO party. We congratulate the Cincy Mike & Key for publishing the Radio Amateur's Code. This should appear more frequently in more publications! OVARA's *Ether Waves* states that BQT, BRA, CGY, EV, GY, KBJ, and WBY all were transferred to Cincinnati as a result of A.T. & T. relocating its central office. The Dayton R. F. Carrier informs us that the Hobby Show of May 12/13 came off with a "bang." The DARA Field Day committee established awards for high-scoring groups and outstanding operators during the Field Day activities; and FPZ has been made director of the W3/S call areas for the TCPN. The Early Bird Transcontinental Net (3845 kc.) roster includes Ohioans AMH, FJV, GDB, FPZ, and K8FCJ. Springfield's Q5 mentions that IKB, HBJ, HOL, and HTE will be featured monthly speakers during monthly meetings, starting with

(Continued on page 84)

# QUALITY PRODUCTS

BY

**B&W**

## 1 KW PI-NETWORK TANK COIL

A high-power integral bandswitched pi-network tank coil for maximum efficiency operation from 80 through 10 meters. For Class "C" or linear operation using triodes or tetrodes in conventional or grounded grid circuits. Positive-acting, high current, r-f switch selects operating band. Stepped sectional coil windings of Model 850, with extra heavy conductor at the higher frequencies, provide ample current carrying capacity, minimum "Q" of 300 over operating range.

## SINGLE SIDEBAND GENERATOR

The 51SB generator offers sparkling SSB performance with your present B&W, Collins, or Johnson transmitter, on 80 through 10 meters with the output frequency control presently in your transmitter.

**ALL OF THESE FINE B&W products are available at leading distributors' everywhere.**

## AUDIO PHASE SHIFT NETWORK

Model 2Q4 splits any audio signal from 300 to 3000 cps into two equal amplitude components  $90^\circ \pm 1.5^\circ$  out of phase with respect to each other . . . for SSB operation.

## COAXIAL SWITCHES

Model 550 permits instant selection of any one of five 52 or 75 ohm lines. Model 551 is a 2-pole, 2-position type used for switching various devices in or out of series connection with coax lines.

## 1 KW BALUNS

Fill the gap between unbalanced feed lines and balanced antenna loads, provide maximum transfer; low power line radiation on transmission; high signal-to-noise ratio on reception. Models for rotary beam, folded dipole antennas.

## CERAMIC PLUG AND JACK BARS

Carefully made steatite materials provide experimenter with same units used on B&W inductors. Strength and rigidity also make them useful as spreaders for feeders and other parts of the antenna system.

## TYPE TVH INDUCTORS

Eight-plug jack bar of these inductors provides greater efficiency on all amateur bands, 160 through 10 meters, as well as greater flexibility of operation.

**Barker & Williamson, Inc.**

237 Fairfield Ave., Upper Darby, Pa.

# Quality, Style and Beauty

## THE *ALL NEW* COMMUNICATIONS RECEIVER

THE TECHNICAL MATERIEL CORPORATION, and TMC CANADA, LIMITED, have for many years been engaged in the manufacture and sale of high quality precision communications equipment such as, high stability direct reading oscillators, radio teletype frequency shifters and converters, broadband transformers, tone telegraph systems and diversity and fixed tuned receivers. Millions of dollars worth of this equipment is in use in twenty or more countries throughout the world. Three of our receivers, the DDR, the DRP and the FFR are now in regular use by the United States and Canadian Air Forces and Navies, so we felt we could produce a really good communications receiver containing many of the high priced requirements of the military and yet keep medium price range for the amateur.

In our work, both consulting and manufacturing, we have tested practically every receiver in the field and have included every basic feature inherent in a good unit but have added some new ones of our own. Compare our features to any receiver in any price range. Bulletin 179B for complete details.

Complete receiver - Amateur Net **\$395<sup>00</sup>**

Matching Speaker \$16.00 extra

## FEATURING:

- Six bands covering .54 to 31 Mc. - AM, CW, MCW, and FS with appropriate FS converter.
- Accurately calibrated main tuning dial plus auxiliary dial with full Electrical bandspread.
- A ferrite transformer provides accurate antenna matching for 75 ohm unbal. and/or 300 ohm balanced inputs.
- Sensitivity: 1 (one) microvolt or better for 10-1 signal to noise power ratio, 1.5 to 31 Mc. Less than 5 microvolts for .54 to 1.5 Mc.
- Image Ratio: Better than 60 db.
- Selectivity: Variable in 6 steps from 200 cy to 5 KC, 5 crystal and one non-crystal positions.
- Input: 105-125VAC 50/60 cy., approx. 90 Watts -
- Output: 4, 8, 16, 600 ohms, 2 Watts high quality audio-better than 60 db hum level.
- Highly effective noise limiter - Calibrated "S" Meter - Dial locks.
- Specially designed Audio Selectivity control with variable bandwidth.
- Diversity operation is available with the GPR-D. Provisions for external control for HFO, BFO, IFO.
- SSB Coaxial IF output & Audio input.
- Cabinet or rack mounting . . . 52 lbs. . . 20" w. x 10" h. x 15" d. (Cabinet.)

### TUBE COMPLEMENT:

6AB4 Grounded grid input RF amp.	3-6BA6 IF Amplifiers
